SELECTED WATER RESOURCES ABSTRACTS

VOLUME 4, NUMBER 1
JANUARY 1, 1971

W71-00001 -- W71-00550

LIBRARY U. OF I., URBANA-CHAMPAIGN

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information will now be provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $22 (domestic), $27.50 (foreign), single copy price $3. Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

LIBRARY U. OF L., URBANA-CHAMPAIGN

VOLUME 4, NUMBER 1
JANUARY 1, 1971

W71-00001 -- W71-00550

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

4/1-3

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Federal Water Quality Administration. A directory of the Centers appears on inside back cover.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1954, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SELECTED WATER RESOURCES ABSTRACTS

01. NATURE OF WATER

1B. Aqueous Solutions and Suspensions

SEA WATER,
Little (Arthur D.), Inc., Cambridge, Mass.
R. A. Horne.
In: Advances in Hydroscience, Vol 6, New York, N.Y., Academic Press, p 107-140, 1970. 134 p, 12 fig, 11 tab, 90 ref.

Descriptors: *Water chemistry, *Water structure, *Sea water, *Reviews, Saline water, Aqueous solutions, Solutes, Water properties, Absorption, Hydrogen ion concentration, Biological properties, Chemical properties, Electrolytes, Nutrients, Trace elements, Oxidation-reduction potential.
Identifiers: Sea water chemistry.

The structure and chemistry of sea water are reviewed. One of the most important recent advances in marine chemistry is the postulation of chemical equilibrium models. The concentrations of major constituents in the more important models are summarized. One of the most complex and certainly one of the most important equilibrium systems in the oceans is the carbonate system, which is fundamental not only to the hydrosphere but to the atmosphere, lithosphere and biosphere as well. This system is believed to maintain the pH of the oceans close to neutrality. Ocean water chemical systems are at least close enough to equilibrium to use equilibrium models. In the immediate neighborhood of the solute a hydration atmosphere is formed. Immediately adjacent to the sodium ion is its 'primary hydration' sheath of 4 strongly bound, tightly electrostricted water molecules. This is in turn surrounded by what is in essence a Frank-Wen cluster. Beyond the region of enhanced water structure is a zone of broken water structure where the Coulombic field is strong enough to disrupt the normal structure of liquid water but not enough to reorient the water molecules. Little is known about the hydration of anions but in general they are believed to be less heavily hydrated than cations. (Knapp-USGS)

RADIATION-INDUCED PREPARATION OF METALS FROM THEIR AQUEOUS SALT SOLUTIONS,
National Aeronautics and Space Administration, Cleveland, Ohio. Lewis Research Center.
Warren H. Philipp, and Stanley J. Marsik.
Available from NTIS as NASA TN D-5880, $3.00 in paper copy, $0.95 in microfiche.National Aeronautics and Space Administration Technical Note, NASA TN D-5880, July 1970. 13 p, 2 fig, 2 tab, 3 ref.

Descriptors: *Radioactivity techniques, *Chemical precipitation, Metals, Metallurgy, Aqueous solutions.
Identifiers: Radiochemistry.

Eleven metals, copper, zinc, cadmium, thallium, tin, lead, antimony, nickel, cobalt, iron, and palladium, were prepared from their aqueous salt solution by irradiation with 2-MeV electrons. In the more successful attempts, the metal yields nG (M) (atoms per 100 eV multiplied by the valence change n) averaged about 2. The yields have been interpreted in terms of the radical scavenging mechanism and the chemistry of the metal system involved. (Knapp-USGS)

02. WATER CYCLE

2A. General

COMPARATIVE HYDROGEOLOGY: AN EXAMPLE OF ITS USE,
Geological Survey, Raleigh, N.C.
Harry E. LeGrand.
Geological Society of America Bulletin, Vol 81, No 4, p 1243-1248, April 1970.6 p, 2 fig, 11 ref.

Descriptors: *Hydrogeology, *Geomorphology, *Surface-groundwater relationships, *North Carolina, Karst, Solubility, Recharge, Groundwater movement, Permeability, Transmissivity, Topography.
Identifiers: Comparative hydrogeology.

As a start toward needed classifications of hydrogeologic settings, a type of setting is described which includes areas where soluble materials are exposed to considerable recharge from precipitation and where both the topographic relief and permeability are small. Typical areas are (1) the Black Belt of the Coastal Plain of Alabama and Mississippi, underlain by chalk of the Selma Group, and (2) a 25-sq-mi area near Harrisburg, Cabarrus County, North Carolina, underlain by gabbro in the Piedmont province. Hydrologic conditions include: excessive evapotranspiration, low water-table gradient, water table near land surface, thin soils, very slow groundwater movement, groundwater movement mainly in the thin soil-rock contact zone, low base flow in streams, low drainage density, and subsurface water relatively high in dissolved mineral matter. Comparative hydrology represents a quick useful means of discerning the significance of processes and principles in particular environements. This setting reveals the significance of solution by subsurface water in developing some plains. Comparative hydrology allows an advanced analysis of some pertinent factors. (Knapp-USGS)
W71-00029

RAINFALL-RUNOFF RELATIONS FOR SOUTHWESTERN LOUISIANA,
Geological Survey, Baton Rouge, La.
F. N. Lee.
Louisiana Department of Public Works Technical Report No 2c, 1969. 91 p, 1 fig, 11 tab.

Descriptors: *Rainfall-runoff relationships, *Louisiana, Depth-area-duration analysis, Data collections, Hydrologic data, Regression analysis, Statistics, Gaging stations, Rain gages, Stream gages.
Identifiers: Southwestern Louisiana.

A method is given for estimating runoff from rainfall in southwestern Louisiana. Two distinct runoff areas are defined by a general exponential formula. Tables list values of the coefficients and exponents calculated for each of the two subareas. Differences in runoff from the two areas are attributed mainly to different soil characteristics. The standard errors of estimate, using all storms for the subareas are about 60% and 80%, respectively. However, as total amounts of runoff increase, the standard errors of estimate decrease. Rainfall, runoff, and storm duration data are tabulated for 1,351 storms analyzed at 37 streamflow stations and 63 rainfall stations. (Knapp-USGS)

WATERSHED SIMULATION BY ELECTRONIC ANALOG COMPUTER,
Utah Water Research Lab., Logan.
J. P. Riley, D. G. Chadwick, and E. K. Israelsen.
The Use of Analog and Digital Computers in Hydrology, Vol I, p 25-37, 1968. 13 p, 9 fig, 11 ref.

Descriptors: *Simulation analysis, *Analog computers, *Hydrologic properties, *Watershed management, *Mathematical models, Water demand, Time, Utah.
Identifiers: Sevier River, Circle Valley.

The problem of the increasing need to assess the downstream consequences resulting from changes at specific locations in a hydrologic system was approached by use of electronic analog simulation. A model was developed for investigating the behavior or response of a dynamic prototype system subject to particular constraints and input functions. Simulation permitted an examination of the composite system involving all processes occurring simultaneously. Studies were undertaken for several watershed areas and involved different time and space increments. Presented were results obtained by simulating a subbasin of the Sevier River drainage in central Utah, referred to as Circle Valley and containing approximately 93,000 acres of mountain watershed and agricultural land. A hydrologic flow diagram was shown representing a basic hydrologic process expressed in mathematical terms. The computer model used synthesized these relationships into a working system. An analog flow chart for the model was also shown. Mean monthly outflow values for 1962 were computed and observed. Analog simulation of other watershed areas was also attempted. INTERACTIONS OF THE BEACH-OCEAN-ATMOSPHERE SYSTEM AT VIRGINIA BEACH, VIRGINIA,
Army Coastal Engineering Research Center, Washington, D.C.
W. Harrison, and W. C. Krumbein.
Available from NTIS as AD-459 084, $3.00 in paper copy, $0.95 in microfiche. Technical Memerandum No. 7, December 1964. 110 p.
Identifiers: *Beaches, Physical properties, *Ocean waves, Wind, Atmosphere, Mathematical analysis, Virginia, Tidewater, Tides, Velocity, Ocean currents, Sedimentation, Interactions, Erosion, Programming (Computers), Least squares method., Air water interactions, Virginia Beach.

A number of interactions among beach variables are investigated by sequential linear multiregression analysis as programmed for high-speed computers. Study includes influence of beach geometry, wave characteristics, tidal effects, and local wind conditions on velocity of longshore currents, deposition and erosion on the lower forshore and response of grain size and beach slope to shore processes. Most-influential combinations of variables arbitrarily designated as 'process' variables are in general agreement with significant variables of wavetank experimentation, and substantiate intuitive judgments regarding relative importance of these variables on natural beaches. Results suggest that certain additional variables, seldom examined under controlled conditions, be studied in combination with variables normally examined in wave tanks. Time lag between inception of a group of 'processes' and moment of their maximum effect on the 'response' is also investigated.

OBSERVATIONS OF WATERSPOUTS AND THEIR PARENT CLOUDS,
National Aeronautics and Space Administration, Moffett Field, Calif. Ames Research Center.
Vernon J. Rossow.
Available from NTIS as NASA TN D-5854, $3.00 in paper copy, $0.95 in microfiche. National Aeronautics and Space Administration Technical Note, NASA TN D-5854, June 1970. 63 p, 24 fig, 1 tab, 58 ref. 2 append.

Descriptors: *Tornadoes, *Storms, Meteorology, Cloud physics, Storm structure, Weather patterns.
Identifiers: Waterspouts.

Waterspouts were studied during the summers of 1967 and 1968 in the area around Key West, Florida. Observations were made from Coast Guard Cutters and from aircraft. Measurements made of the electric and magnetic fields associated with these atmospheric vortices indicate that electricity does not play a primary role in their structure. Although electricity is eliminated as an essential or defining mechanism, some evidence was found (low cloud tops and a lightening demise of a spout) to indicate that these vortices cannot exist if electricity is too prominent. Of the 104 events sighted, it was found that 30 rotated cyclonically, 9 anticyclonically, and the rest either went unnoticed or were not observable. The parent clouds had tops at 8,000-12,000 ft and bottoms from 800-2,500 ft altitude. The mechanism responsible for the formation of the vortex at the time and location of its occurrence was not determined. The relationship to tornado structure is uncertain. (Knapp-USGS)
W71-00038

ORIGIN AND GEOMORPHOLOGY OF THE THAR DESERT,
Ranchi Univ. (India). Dept. of Geography.
Enayet Ahmed.
Annals of Arid Zone, Vol 8, No 2, p 171-180, September, 1969. 5 ref.

Descriptors: *Geomorphology, *Sands, *Arid lands, *Climatology, History, Geology, Wind erosion, Monsoons, Precipitation (Atmospheric), Weathering, Soil types, Deserts.
Identifiers: *India, *Thar Desert, Archaeology, Desert formation.

The Thar Desert is unique among world deserts because it does not fall in the lee of trade winds. Climatological factors cause the deflection of the southwest monsoons and there are no regional highlands that might cause relief rainfall. On the basis of archaeological finds of human settlements in prehistoric times, it has been theorized that the Thar Desert originated in post-Pleistocene times and that its extensive sand cover is derived by wind transport from the Rann of Kutch. The author argues that the Thar Desert is much older than the human species from the following considerations: (1) Nowhere else in the world are desert sands derived from coastal sands; (2) geological evidence for the existence of much earlier arid condtions; (3) lack of evidence of a shifting desert margin in modern times; (4) the physical impossibility of so much sand originating in the Rann of Kutch. Desert sand is largely quartz, and unlike soft minerals, is resistant to weathering. The strong winds carry away lighter, richer particles and the lack of water prevents clay and silt layering. (Casey-Arizona)
W71-00149

WATER BUDGET IN THE ARID ZONE OF RAJASTHAN DURING 1941-1960,
Central Arid Zone Research Inst., Jodhpur (India).
A. Krishnan, and K. P. Thanvi.
Annals of Arid Zone, Vol 8, No 2, p 291-299, September 1969. 3 fig, 4 tab, 10 ref.

Descriptors: *Arid lands, *Precipitation (Atmospheric), *Evapotranspiration, *Water balance, *Moisture deficit, Monsoons, Groundwater recharge, Soil moisture, Weather data, History, Variability.
Identifiers: India, *Thar Desert, *Rajasthan.

Records of 7 weather stations in arid west Rajasthan from 1941-1960 were analyzed in an attempt to elucidate year to year variability in the various components of water balance. Normally, all stations show a water deficit every month of the year, which decreases considerably during the monsoon season of July to October. During most years there is neither widespread drought nor excess precipitation and even in the wettest year moisture deficiency from January to monsoon onset was high. Generally, moisture surplus in excess of soil water capacity, effecting groundwater recharge, occurs only once in 20 years. (Casey-Arizona)
W71-00153

A STATISTICAL ANALYSIS OF THE RAINFALL OVER THE SUDAN,
Khartoum Univ. (Sudan). Dept. of Geography.
Mahdi Amin El-Tom.
Geographical Journal, Vol 135, No 3, p 378-387, 1969. 7 fig, 4 tab, 5 ref.

Descriptors: *Rainfall, *Climatology, *Monsoons, *Topography, Statistical methods, Regression analysis, Temperature.
Identifiers: *Sudan, *Inter Tropical Convergence Zone, *Latitude, *Line-squalls, Correlation coefficients, Longitudes, Residuals.

Rainfall is the outcome of a combination of many factors. A statistical analysis was made of 4 of these factors especially important in the Sudan. The 4 factors were transferred to equivalent spatial terms: (1) Inter Tropical Convergence Zone (ITCZ)-latitude, (2) relief-altitude, (3) monsoons--a distance and (4) line-squalls--longitudes east of Greenwich, since line-squall effects seem to change in relation to longitudes. A high negative correlation (-0.951) exists between annual rainfall and ITCZ and between the monsoonal factor and annual rainfall (-0.914). Regression lines of all 4 spatial factors on annual rainfall were calculated. All spatial factors, especially (1) and (3) were intercorrelated to some extent. The effect was eliminated by a partial regression analysis. The total annual percentage contribution of the 4 factors to rainfall was 92.76 with 90.48 being contributed by (1) alone. Residual patterns roughly follow longitudes, indicating that other factors, possibly local temperature, also effect Sudanese rainfall. (Casey-Arizona)

ON THE POSSIBILITY OF WEATHER MODIFICATION BY AIRCRAFT CONTRAILS,
Alaska Univ., College. Geophysical Inst.
Wallace B. Murcray.
Monthly Weather Review, Vol 98, No 10, p 745-748, October 1970. 4 p, 11 ref. HEW Grants APOO 449-01, APOO 440-02, and APO 00449-03, NSF grant GA-19475.

Descriptors: *Clouds, *Aircraft, *Air pollution effects, *Cloud seeding, *Weather modification, Air pollution, Cloud physics, Chemistry of precipitation, Precipitation (Atmospheric).
Identifiers: Contrails, Ice fog.

The possible effect of contrails in modifying the weather is reconsidered in the light of information obtained from ground-level contrails in Alaska. It appears likely that inadvertent cloud seeding by jet aircraft may be of the same order of magnitude as that attained in commercial cloud seeding operations. Further investigation is needed; but in the meantime, the possibility of contrail contamination should be kept in mind when evaluating the results of seeding operations. (Knapp-USGS)

PREDICTING PRECIPITATION TYPES,
Weather Bureau, Salt Lake City, Utah. Western Region.
Robert J. C. Burnash, and Floyd E. Hug.
Available from NTIS as PB-190 962, $3.00 in paper copy, $0.95 in microfiche. Technical Memorandum WR-49, March 1970. 12 p.
Identifiers: *Atmospheric precipitation, *Weather forecasting, Snow, Rainfall, Ice, Radiosondes, Surface properties, Dew point, Classification, Heat transfer, Atmospheric sounding, Cooling, Utah.

The report discusses possibilities of distinguishing precipitation types. The fact that California's primary snow areas are located at a considerable distance from radiosonde stations made it necessary to place two data requirements on cases to be analyzed: (1) The wind direction at a radiosonde station must be stable enough to indicate air mass characteristics that would be advected to a definable sector of the precipitation area. (2) Information from the precipitation area must be adequate to determine the level at which snow changes to rain. A study of data for the period 1955-1967 inclusive meeting these requirements led to selection of two primary criteria which would be useful in predicting the level at which snow would change to rain. Depth of the moist layer colder than zero degrees Celsius, and heat required to convert falling snow to rain.
W71-00451

TECHNIQUES FOR FORECASTING LOW WATER OCCURENCES AT BALTIMORE AND NORFOLK,
Weather Bureau, Silver Spring, Md. Techniques Development Lab.
James M. McClelland.
Available from NTIS as PB-191 744, $3.00 in paper copy, $0.95 in microfiche. ESSA Technical Memorandum WBTM TDL 28, March, 1970. 43 p.
Identifiers: *Harbors, Shipping (Marine), *Tides, Weather forecasting, Regression analysis, Barometric pressure, Meteorological charts, Ships (Nonmilitary), Chesapeake Bay, Baltimore (Maryland), Norfolk (Virginia), Air water interactions.

The report describes the development of manual techniques for forecasting low water occurrences at Baltimore and Norfolk, Each technique is based on a regression equation, derived by the multiple correlation-screening process, which requires certain surface wind and pressure data from three Chesapeake Bay stations. The minimum and maximum time lags for each equation are 6 and 24 hours, respectively. Tests on independent data from Baltimore and Norfolk show root-mean-square errors of 0.6 feet and 0.4 feet, respectively. These techniques can be useful forecast aids when used under synoptic conditions favorable for low water occurrences.

ICE PRESSURE ON ENGINEERING STRUCTURES,
Laval Univ., Quebec. Dept. of Civil Engineering.
Bernard Michel.
U S Army Corps of Engineers Cold Regions Research and Engineering Laboratory Science and Engineering Monograph III-B1b, June 1970. 71 p, 39 fig, 10 tab, 79 ref. Project DA 1T062112A130.

Descriptors: *Ice loads, *Hydraulic structures, *Reviews, *Bibliographies, Ice, Ice jams, Reservoirs, Dams, Pressure, Loads (Forces), Engineering structures.
Identifiers: Ice pressure.

One of the most important forces in the design of a dam in northern regions is the horizontal thrust applied to the structure by a solid sheet of ice. There have been few reported dam failures caused by ice pressure and some engineers have doubted the advisability of making substantial allowances for this pressure in the design of hydraulic structures. But measurements made during the last few years leave no doubt as to its importance. Extensive measurements were made from 1946 to 1951 at several reservoirs in the mountains of Colorado. Indenter and strain gages were set in thin mortar panels that could be installed on the face of the walls and at sites exposed to ice thrust. The maximum measured ice pressure at Eleven Mile Canyon was 16 kips/ft in 1947-48, 14 kips/ft in 1948-49 and 20 kips/ft in 1949-50. The highest thrust of all, 17 kips/ft, was recorded at Tarryall Reservoir which has steep rocky shores in the vicinity of the dam. This monograph summarizes and reviews existing knowledge on forces exerted by an expanding ice sheet, impact forces of ice on structures, and vertical forces exerted by ice on hydraulic structures. Sections are also devoted to icebreakers and ice models. A bibliography of 79 entries is included. (Knapp-USGS)
W71-00012

ICE FORMATION BY CONTACT NUCLEATION,
State Univ. of New York, Albany.
Narayan R. Gokhale.
New York State University at Albany Scientific Report, June 1970. 54 p, 20 fig, 19 ref, 4 append.NSF Grants GA328 and GA839.

Descriptors: *Nucleation, *Freezing, *Cloud seeding, *Chemistry of precipitation, Condensation, Particle size, Silver iodide, Laboratory tests.
Identifiers: Contact nucleation.

An investigation of the phenomenon of ice nucleation in water drops due to contact by dry particles at their surfaces was made by observing and photographing the freezing of a large number of water drops. Particles are much more effective in freezing water drops by contact at their surfaces than when they are embedded in the drops. The shift toward warmer temperatures is in the range of 5 to 10C depending on the material. Particles have considerably higher effect on nucleating water drops which are supercooled before the particles land on the surface, than the drops which are not supercooled. The effective degree of supercooling of drops for silver iodide is -5C and for silicate material -8C. Among the materials tested, AgI particles are the most effective in contact nucleation. This shows that a surface structure of the particle similar to that of ice from the point of view of crystal symmetry, and lattice dimensions seems to be important in this mechanism. The freezing is initiated by the particle at the point of contact on the surface of a drop. The surface film freezes first and then the interior of the drop freezes. The best results are obtained in freezing freely suspended millimeter-size water drops in clouds by contact nucleation if silver iodide particles are introduced in the region where the degree of supercooling is at least -5C. (Knapp-USGS)
W71-00032

DYNAMIC YOUNG'S MODULUS AND FLEXURAL STRENGTH OF SEA ICE,
Army Terrestrial Sciences Center, Hanover, N.H.
Guenther E. Frankenstein, and Robert Garner.
Army Cold Regions Research and Engineering Laboratory Technical Report 222, May 1970. 14 p, 4 fig, 2 tab, 10 ref, append. DA Task No 1T062112A13001.

Descriptors: *Sea ice, *Youngs modulus, *Shear strength, *Elastic deformation, *Deflection, Strength of materials, Elastic theory, Tensile strength, Deformation, Elasticity (Mechanical).
Identifiers: Elastic properties (Ice).

Tests were made to determine the dynamic Young's modulus of sea ice. The ice samples were mainly parallelepipeds but a few were 7.62-cm-diam cores. The longitudinal wave velocity (a function of Young's modulus) was determined by measuring the time required for a sound wave to travel the length of the sample. The measured wave velocities were corrected, by Love's frequency equation, to apply for infinite wavelengths. The flexural strength of the ice was determined by conducting a number of simple beam tests. The average value for the flexural strength was 11.3 kg/sq cm. (Knapp-USGS)

PHASE BOUNDARY WATER IN FROZEN SOILS,
Army Terrestrial Sciences Center, Hanover, N.H.
For primary bibliographic entry see Field 02G.
W71-00044

DESCRIPTION AND CLASSIFICATION OF FROZEN SOILS,
Army Terrestrial Sciences Center, Hanover, N.H.
K. A. Linell, and C. W. Kaplar.
Army Materiel Command Cold Regions Research and Engineering Laboratory Technical Report 150, August 1966. 12 p, 7 fig.

Descriptors: *Frozen soils, *Soil classifications, *Permafrost, Soil physical properties, Freezing, Thawing, Soil water, Ice, Soil chemical properties.
Identifiers: Frozen soil classification.

The description and classification of frozen soils is presented as an extension of the Unified Soil Classification System adopted by the U.S. Army Corps of Engineers and the U.S. Bureau of Reclamation in 1952. Descriptions, based on physical appearance, are nongenetic and are applicable to both naturally and artificially frozen soils. Field identification data pertaining to frozen soils and those pertinent properties of frozen materials which can be measured by physical tests are indicated. Also, guides are presented for construction on soils subject to freezing and thawing. The report includes photographic illustrations of frozen soil types; a chart showing relationships between unit dry weight of soil, water content, and ice volume; and an example of graphical presentation of frozen soil data. (Knapp-USGS)

STUDIES OF MORPHOLOGY AND STREAM ACTION ON ABLATING ICE. PART I. MORPHOLOGY AND STRUCTURE OF AN ICE-CORED MEDIAL MORAINE, KASKAWULSH GLACIER YUKON,
Arctic Inst. of North America, Washington, D.C.
S. R. Loomis.
Available from NTIS as AD-709 616, $3.00 in paper copy, $0.95 in microfiche. Arctic Institute of North America, Research Paper No. 57, Wash. D.C. January 1970. 167 p. Army Research Office Support.
Identifiers: *Glaciers, Yukon Territory, Ice, Ablation, Structural properties, Rock (Geology), Fluid flow, Transport properties, Surface, Friction, Thickness, Meeting, Terrain, Inland waterways, Snow, Gravel, Deposits, Soils, *Kaskawulsh glacier (Yukon Territory), Stream morphology, Moraines, Lithology, Topographic profiles.

Part I, 'Morphology and Structure of an Ice-Cored Medial Moraine, Kaskawulsh Glacier, Yukon, describes morphological and lithological characteristics of a medial moraine and their relationship to ablation and flow processes on Kaskawulsh Glacier. Part II, 'Channel Adjustments and Supraglacial Streams,' describes the seasonal evolution of a supraglacial stream in terms of stream morphology and energy exchange on the Capps Glacier. Part III, 'Supraglacial Streams on the Kaskawulsh Glacier, Yukon Territory,' classifies supraglacial streams on

the Kaskawulsh Glacier in relation to structure, morphology, bet material, and seasonal processes.

PHASE BOUNDARY WATER IN FROZEN SOILS,
Cold Regions Research and Engineering Lab., Hanover, N.H.
Duwayne M. Anderson.
Available from NTIS as AD-706 840, $3.00 in paper copy, $0.95 in microfiche. Research Report 274, May 1970. 24 p, 8 fig, 41 ref.
Identifiers: *Arctic regions, Soils, *Soils, Water, Freezing, Melting, Interfaces, Ice, Silicates, Air, Heat transfer, Montmorillonite, Remote areas.

It is now widely recognized that water a phase boundaries plays an important and in some cases the dominant role governing heat and mass transport, electrical conduction, transmission of compression waves and other processes of importance in frozen soils. There is also an increasing recognition of the contrast between the complexity of the phenomenology of freezing and thawing and the crudeness of the concepts and models that so far have been available. This report summarizes presently accepted concepts and information and sketches an area where significant advances in knowledge are to be expected.

2D. Evaporation and Transpiration

IMPLICATIONS OF A TYPE OF EMPIRICAL EVAPORATION FORMULA FOR LAKES AND PANS,
Cornell Univ., Ithaca, N.Y.
Wilfried Brutsaert, and Gour-Tsyh Yeh.
Research supported by Federal Water Pollution Control Administration.Water Resources Research, Vol 6, No 4, p 1202-1208, August 1970. 7 p, 1 fig, 22 ref.

Descriptors: *Evaporation, *Equations, *Mass transfer, *Evaporation pans, Mathematical models, Lakes, Winds, Advection, Turbulence, Diffusion, Reservoir evaporation, Water temperature.
Identifiers: Lake evaporation.

Empirical mass transfer formulas for evaporation from lakes and from pans at ground level are compared with the theoretical solution based on semiempirical turbulent diffusion theory in conjunction with Reynolds analogy and the power law for the wind profile. It was found that although the theory has its limitations, it is a useful tool for the study of evaporation, especially under conditions of lateral advection. The empirical formulas should be adequate for many design problems. (Knapp-USGS)

ESTIMATES OF EVAPORATION IN EAST AFRICA IN RELATION TO CLIMATOLOGICAL CLASSIFICATION,
East African Agriculture and Forestry Research Organization (Kenya).
M. Dagg, and J. R. Blackie.
Geographical Journal, Vol 136, No 2, p 227-234, 1970. 3 fig, 3 tab, 18 ref.

Descriptors: *Evapotranspiration, *Climatology, *Solar radiation, *Evaporation, Semiarid climates, Seasonal, Temperature, Land use, Water balance, Water consumption (Excludes consumptive use), Evaporation pans, Climatic data.
Identifiers: Pans, Thornthwaite climatological classifications, Africa, Equatorial conditions.

Accurate climatological classification is important in underdeveloped lands in order to facilitate realistic planning for agricultural development. The water balance of a forested catchment area at Kericho, Kenya, was measured over a period of 8 years (1958-1968) and evapotranspiration was compared to those calculated from various climatic classification theories. The Thornthwaite and Olivier methods considerably underestimated evaporation while the class 'A' pan and Penman methods not only closely agreed with measurements but also showed a realistic seasonal variation. It is argued that the greater accuracy of Penman's methods over others was due to the use of radiation data which are less conservative than temperature data and more appropriate to equatorial climatic conditions. In drier arid regions evaporation may be little related to evapotranspiration from well water transpiration surfaces. Using Thornthwaite's evaporation estimates, the area was classified Humid B2. With Penman's data, classification is dry sub-humid C1 and is probably more useful to land-use planners. (Casey-Arizona)

EFFECT OF WATER-TABLE LEVELS ON EVAPOTRANSPIRATION AND CROP YIELD,
Agricultural Research Service, Raleigh, N.C. Soil and Water Div.
R. E. Williamson, and John R. Carreker.
Americal Society Africultural Engineers Transactions, Vol 13, No 2, p 168-170, March-April 1970. 3 p, 4 fig, 5 tab.

Descriptors: *Evapotranspiration, *Model studies, Rainfall, Soils, Water table, Crops.
Identifiers: *Water-table levels, *Crop yield, Soil tanks.

Crops were grown in soil tanks with different depths to the water table in 1959 to 1964, inclusive. Six tanks were without shelters and subjected to rainfall, and 48 tanks were protected from rain by rain-controlled, electrically operated shelters. Surface soils used in these tanks were Norfolk fine sandy loam in the nonsheltered tanks, fine sandy loam in 20 sheltered tanks, and Bayboro loam in 28 sheltered tanks. No attempt was made to reconstruct the soil profiles. These soils were adjusted initially to pH 6.0 with dolomitic limestone. Fertilizer and lime were mixed into the top 6 in. each year. Salt content was monitored and the sheltered tanks were leached as necessary to prevent a buildup of salts. Water-table levels were established 2 to 3 weeks after crops were planted. The depths to water were 6, 18, and 30 in. in the nonsheltered tanks and 6, 12, 18, 24 and 30 in. in the sheltered tanks 3 ft. deep. Additional levels of 36 and 40 in. were maintained in the sheltered tanks 4 feet deep. Daily rates of evapotranspiration in the sheltered tanks generally were slightly higher for the 12-in. depth to water table than for the 6-in. depth. The rate then tended to decline as depth increased with most crops. Tables and curves relating rainfall, water tables, soils, and crops to evapotranspiration are presented. (Woodard-USGS)

STOCHASTIC ASPECTS OF LAKE ONTARIO EVAPORATION,
Rutgers - The State Univ., New Brunswick, N.J.
Shaw L. Yu, and Wilfried Brutsaert.
Water Resources Research, Vol 5, No 6, Dec 1969. p 1256-1266, 7 fig, 5 tab, 13 ref.

Descriptors: *Lake Ontario, *Evaporation, *Stochastic processes, *Meteorology, *Correlation analysis, Wind velocity, Markov processes, Air temperature, Lakes.
Identifiers: Water budget.

Time series analysis was carried out on long-term monthly mean values of evaporation from Lake Ontario, which were generated in an earlier study, and on related meteorologic parameters. Correlation and spectral analyses showed that the annual cycle was dominant in all the time series. Evaporation is usually high in autumn and winter and low in spring and summer. A warming trend was observed in the air temperature and a drying trend in the relative humidity series. Except for the wind speed, no significant trend was found for the other time series. Cross correlation and cross-spectral analyses showed a close relationship between evaporation anomalies and the anomalies of the other parameters. A first order Markov model adequately described the evaporation, air temperature, and relative humidity anomalies, whereas a second order model fitted the anomalies of wind speed and water surface temperature. Morton's (1967) water budget method yields higher evaporation estimates in the summer and lower estimates in the winter than the mass transfer estimates. (Upadhyaya-Vanderbilt)
W71-00233

ESTIMATING STEADY-STATE EVAPORATION RATES FROM BARE SOILS UNDER CONDITIONS OF HIGH WATER TABLE,
Geological Survey, Menlo Park, Calif.
C. D. Ripple, J. Rubin, and T. E. A. van Hylckama.
Geological Survey, Open-file report, 1970. 62 p, 10 fig, 28 ref, append.

Descriptors: *Evaporation, *Soil water movement, *Groundwater movement, *Air-earth interfaces, Water table, Humidity, Temperature, Mass transfer, Meteorology, Hydraulic conductivity.
Identifiers: Evaporation from bare soil.

A procedure that combines meteorological and soil equations of water transfer makes it possible to estimate approximately the steady-state evaporation from bare soils under conditions of high water table. Field data required include soil-water retention curves, water table depth and a record of air temperature, air humidity and wind velocity at one elevation. The procedure takes into account the relevant atmospheric factors and the soil's capability to conduct water in liquid and vapor forms. It neglects the effects of thermal transfer (except in the vapor case) and of salt accumulation. Homogeneous as well as layered soils can be treated. Results obtained with the method demonstrate how the soil evaporation rates depend on potential evaporation, water table depth, vapor transfer and certain soild parameters. (Knapp-USGS)
W71-00370

EVAPOTRANSPIRATION AS AFFECTED BU PLANT DENSITY AND WATER-TABLE DEPTH,
Agricultural Research Service, Fort Lauderdale, Fla. Plantation Field Lab.
E. H. Stewart, J. E. Browning, and E. O. Burt.
American Society of Agricultural Engineers Transactions, Vol 12, No 5, p 646-647, September-October 1969. 2 p, 3 fig, 1 tab, 3 ref.

Descriptors: *Evapotranspiration, *Soil-water-plant relationships, *Vegetation effects, *Water table, Model studies, Rainfall, Soil structure, Lysimeters, Irrigation effects.
Identifiers: Evapotranspirometers.

Evapotranspiration data from Tifway bermudagrass were obtained with nonweighing evapotranspirometers at the Plantation Field Laboratory near Fort Lauderdale, Fla. The installations consist of 12 waterproof rectangular concrete tanks, 5 ft deep, each having a plot area of approximately 1/1,000 acre. The soil was removed from excavation site and replaced inside and outside the tanks in approximately 1-ft layers to reconstruct the original soil profile as closely as possible. Relationships were linear between degree of plant cover and annual evapotranspiration of Tifway bermudagrass grown on Arzel fine sand with 12-, 24-, and 36-inch water tables. Evapotranspiration increased with sod cover at water-table depths of 24 and 36 inches, but decreased slightly with cover for the water-table depth of 12 inches. The ratio between evapotranspiration from no sod or a partial sod and a full sod was related to the depth to water table

and the amount, frequency, and distribution of rainfall. Graphs, tables of data, and a picture of the model are included. (Woodard-USGS)

Geological Survey, Austin, Tex. Water Resources Div.

Copies of report may be obtained at U S Geological Survey, WRD, Federal Bldg, 300 E 8th St, Austin, Texas 78701. Geological Survey Open-file report, 1970. 73 p, 2 fig, 3 tab.

Descriptors: *Rainfall, *Runoff, *Streamflow, *Texas, Discharge measurement, Stream gages, Storm runoff, Peak discharge, Low flow, Average flow, Hydrographs, Mass curves.
Identifiers: *Escondido Creek (Kenedy, Texas), Weighted-precipitation record, Inflow and outflow computation.

This report contains rainfall and runoff data collected during the 1968 water year (October 1967 to September 1968) for the 72.4 square-mile area above stream-gaging station Escondido Creek at Kenedy, Texas. Monthly and yearly rainfall and runoff data from 1954 to 1968 are included. The location of floodwater-retarding structures and hydrologic instruments in the area are shown. Current objectives of the study are to determine the net effect of floodwater-retarding structures on the regimen of streamflow at downstream points; to develop computation techniques that will provide more accurate estimates of runoff resulting from a given amount of rainfall on small watersheds; to develop relationships between maximum rates of runoff and rainfall in small watersheds that will enable more accurate design of small storm-drainage structures; and to determine the minimum instrumentation necessary to make reliable estimates of total storm inflow to the structures. A STUDY OF STREAM BEHAVIOR IN THE CANTERBURY FOOTHILLS, NEW ZEALAND,
New Zealand Forest Service, Wellington. Forest Service Inst.
Hans M. Keller.
New Zealand Ministry of Works--Water and Soil Division Miscellaneous Hydrological Publication No 3, 1970. 15 p, 7 fig, 7 tab, 14 ref.

Descriptors: *Streamflow, *Stream erosion, *Geomorphology, Drainage patterns (Geologic), Vegetation effects, Geology, Rainfall-runoff relationships, Topography, Alluvial channels, Erosion.
Identifiers: *New Zealand.

The streamflow and geomorphology of a catchment with an area of 7.42 square miles in the Canterbury foothills, New Zealand, was studied. Analyses of topographical maps and aerial photographs were used, as well as field surveys of the stream bed, side slopes, and flow conditions. Hypsometric, intercepting-surface, and stream-profile analyses were adequate to obtain a quantitative measurement of permanent characteristics and, in turn, to allow a direct comparison of the 2 main branches and the 2 subcatchments. Of other surveys and analyses, those of side-slope conditions, detailed sections of longitudinal profile, streamflow comparisons (using conductivity measurements), and vegetational establishment on gravel terraces appeared promising for comparative studies. (Knapp-USGS)

COMPILATION OF HYDROLOGIC DATA, MOUNTAIN CREEK, TRINITY RIVER BASIN, TEXAS, 1968.
Geological Survey, Austin, Tex. Water Resources Div.

Copies of report may be obtained at US Geological Survey, WRD, Federal Bldg, 300 E 8th St, Austin, Texas, 78701. Geological Survey Open-file report, 1970. 9 p, 1 fig.

Descriptors: *Streamflow, *Discharge measurement, *Stream gages, *Texas, Peak discharge, Low flow, Average flow, Rainfall.
Identifiers: *Mountain Creek watershed (Texas).

Compiled in this report are streamflow and reservoir-content data collected in the Mountain Creek watershed, Texas, during the 1968 water year (October 1967 to September 1968). Total outflow from the Mountain Creek basin for the 1968 water year was 106,400 acre-feet. Storage in Mountain Creek Lake increased 130 acre-feet and rainfall during the water year was 36 inches, which is about 2 inches above the long-term mean for the area. Average discharge values and discharge extremes for 8 years of record (1960-68) are given for each of the 4 gaging sites. (Woodard-USGS)

URBAN HYDROLOGY OF THE HOUSTON, TEXAS METROPOLITAN AREA, COMPILATION OF BASIC DATA, 1967,
Geological Survey, Houston, Tex.
S. L. Johnson.
Copies of report may be obtained from US Geological Survey, Water Resources Div, Federal Bldg, 300 E 8th St, Austin, Texas 78701. Geological Survey Open-file report, 1970. 251 p, 15 fig, 22 tab.

Descriptors: *Rainfall, *Runoff, *Texas, Streamflow, Discharge measurement, Stream gages, Storm runoff, Peak discharge, Low flow, Average flow, Hydrographs, Mass curves.
Identifiers: *Urban Hydrology, *Houston (Texas), *San Jacinto River Basin, *Clear Creek Basin.

Compiled in this report are surface-water records for stream-gaging stations and crest-stage partial-record stations, and rainfall records at partial-record stations and miscellaneous sites within the Houston, Texas metropolitan area (San Jacinto River and Clear Creek basins) for the period October 1966 to September 1967. The objectives are to provide basic runoff data for small urban drainage areas which differ in topography, soil, vegetation, tributaries, basin shape, and degree of urbanization; to provide related rainfall data with consideration of variation in intensity and location; and to provide data showing the effects of progressive urbanization on flood peaks and volume. Maps, basic-data tables, and hydrograph and mass curves are included. (Woodard-USGS)

PEAK FLOW AND CRITICAL DURATION FOR SMALL WATERSHEDS,
Minnesota Univ., Minneapolis. Dept. of Agricultural Engineering.
C. L. Larson, and R. E. Machmeier.
American Society of Agricultural Engineers Transactions, Vol 11, No 2, p 208-213, 1968. 6 p, 7 fig, 3 tab, 17 ref.

Descriptors: *Mathematical models, *Rainfall-runoff relationships, *Small watersheds, *Peak discharge, Routing, Rational formula, Parametric hydrology, Time lag, Model studies, Unit hydrographs, Computer programs, Duration curves, Runoff forecasting.
Identifiers: Critical duration.

A peak flow equation analytically based and applicable to the channel phase of runoff is presented. The equation is useful in estimating peak discharge for ungaged watersheds up to 100 sq mi or more in area. A new watershed time parameter, time to virtual equilibrium (Tve), is proposed. Both theory and results with a mathematical watershed model indicate that Tve is not constant, but varies as supply rate to a power from - 0.20 to - 0.30. For geometrically similar watersheds, it varies approximately as watershed area to the 0.30 power. A 50-year, duration-supply rate relationship is estimated for the model watershed. Peak discharges are then calculated by the peak-fow formula. Peak discharges are caused by a supply duration much less than time to equilibrium. For the model watershed, peak discharges for a given duration were not proportional to supply rate, as assumed in unit hydrograph analysis. Time parameters, including Tve, time to peak and lag time were not constant but varied with supply rate. Surface runoff is basically nonlinear. (Knapp-USGS)

WATER-SURFACE ELEVATIONS AND CHANNEL CHARACTERISTICS FOR SELECTED REACHES OF THE ROGUE RIVER AND ELK CREEK, JACKSON AND JOSEPHINE COUNTIES, OREGON,
Geological Survey, Portland, Oreg.
D. D. Harris.
US Geological Survey Open-file report, 1970. 61 p, 43 fig, 6 tab, 4 ref.

Descriptors: *Floods, *Stage-discharge relations, *Surveys, *Oregon, Water levels, Planning, Zoning, Profiles, Flood plain zoning, Regulation, Gaging stations, Frequency analysis, Channel morphology, Data collections, Hydrologic data.
Identifiers: Rogue River (Oreg).

Water-surface profiles and channel characteristics, geometry and slope, are given for a reach of the Rogue River from the Jackson-Josephine County line, Oregon upstream to Lost Creek damsite and for a reach of Elk Creek from the mouth upstream to Elk Creek damsite. Profiles were defined for the flood of December 1964; the 20-year flood; the 10-year flood; the flood of December 1964 after adjusting for storage in the proposed upstream reservoirs; a low flow considered to be the minimum operational flow from the proposed reservoirs; and the thalweg (the lowest part of the channel bottom). The profile of the adjusted December 1964 flood was determined for the reach of the Rogue River downstream from Dodge Bridge where adjusted discharge data were available. The step-backwater method was used to define the high-water profiles; photogrammetric maps and water-depth soundings made during the periods of low flow ere used to define the low-water and thalweg profiles. (Knapp-USGS)

MAXIMUM KNOWN STAGES AND DISCHARGES OF NEW YORK STREAMS THROUGH 1967,
Geological Survey, Albany, N.Y.
Bernard Dunn.
New York Water Resources Commission Bulletin 67, 1970. 57 p, 1 tab.

Descriptors: *Stage-discharge relations, Discharge (Water), *Peak discharge, *New York, Data collections, Runoff, Streamflow, Hydrologic data, Stream gages.
Identifiers: Streamflow data.

Maximum stages and discharges in New York streams are compiled from the files of the U.S. Geological Survey. The data are tabulated under the heading of the major river or lake basin in which the stream is located. The period of record begins with the first calendar year and ends with the last calendar year for which a peak discharge is known. In most cases there are also peaks for each of the intervening years. (Knapp-USGS)

A PROPOSED STREAMFLOW DATA PROGRAM FOR MICHIGAN,
Geological Survey, Lansing, Mich.
Paul C. Bent.
Geological Survey Open-file report, 1970. 69 p, 5 fig, 8 tab, 8 ref, 1 append.

Descriptors: *Streamflow, *Data collections, *Synoptic analysis, *Project planning, Programs, Regression analysis, Runoff, Precipitation (Atmospheric).
Identifiers: Proposed streamflow-data program, Streamflow characteristics, Drainage basin characteristics, Natural-flow streams, Regulated-flow streams.

An evaluation of the streamflow data available in Michigan was made to provide guidelines for planning future water resource programs. The basic steps in the evaluation procedure were (1) definition of the long-term goals of the streamflow data program in quantitative form, (2) examination and analysis of all available data to determine which goals have already been met, and (3) consideration of alternate programs and techniques to meet the remaining objectives. It was found that most goals could not be met by regionalization of the data for gaged basins by regression analysis. This fact indicates that few changes can be made in the present program on the basis of computing data by regression formulas. However, regression formulas that include factors not evaluated as a part of this study, may provide a basis for regional streamflow analysis. The evaluation indicated that some changes in the streamgaging network can be made on the basis of length of records already collected. A streamflow data program based on the guidelines developed in this study is proposed for the future. (Woodard-USGS)

COMPILATION OF HYDROLOGIC DATA, COW BAYOU, BRAZOS RIVER BASIN, TEXAS, 1968.
Geological Survey, Austin, Tex. Water Resources Div.

Geological Survey Open-file report, 1970. 80 p, 3 fig, 3 tab.

Descriptors: *Rainfall, *Runoff, *Storage, *Texas, Streamflow, Discharge measurement, Stream gages, Storm runoff, Peak discharge, Low flow, Average flow, Hydrographs, Mass curves.
Identifiers: *Brazos River Basin (Texas), Weighted-precipitation record, Inflow and outflow computations.

This report contains rainfall, runoff, and storage data collected during the 1968 water year (October 1967 to September 1968) for the 79.6 square-mile area above stream-gaging station Cow Bayou at Mooreville, Brazos River Basin, Texas. Monthly and yearly rainfall, runoff, and storage data from 1957 to 1968 are included. The location of flood-water-retarding structures and hydrologic instruments in the area are shown. Current objectives of the study are to determine the net effect of flood-retarding structures on the regimen of streamflow at downstream points; to develop computation techniques that will provide more accurate estimates of runoff resulting from a given amount of rainfall on small watersheds; to develop relationships between maximum rates of runoff and rainfall in small watersheds that will enable more accurate design of small storm-drainage structures; and to determine the minimum instrumentation necessary to make reliable estimates of total storm inflow to the structures. WATER RESOURCES OF THE GUAYANILLA-YAUCO AREA, PUERTO RICO,
Geological Survey, San Juan, Puerto Rico.
James W. Crooks, I. G. Grossman, and Dean B. Bogart.
Commonwealth of Puerto Rico Water-Resources Bulletin 5, 1968. 55 p, 27 fig, 12 tab, 10 ref.

Descriptors: *Water resources development, *Puerto Rico, Surface waters, Groundwater, Water supply, Data collections, Hydrologic data, Hydrogeology, Conjunctive use, Water wells, Aquifers, Saline water intrusion.
Identifiers: Guayanilla-Yauco area (Puerto Rico).

More water is available for use than was being used in 1961 in the Guayanilla-Yauco area, which comprises the lower part of the basins of Rio Yauco, Rio Guayannilla, and Rio Macana, an area of about 33 sq mi in northwestern Puerto Rico. Water use in 1961 was about 37,000 ac-ft (acre-feet), a little more than half of which was groundwater. Of the quantity used, about 85% was for irrigation. About 43,000 ac-ft of streamflow enters the Guayanilla-Yauco area annually, on the average, much of which is lost to the sea during floods. In addition, rainfall on the area averages about 67,000 ac-ft, making a total input to the area of about 110,000 ac-ft. In the drier-than-average year of 1962, the total input was about 79,000 ac-ft. The easiest and least costly way to obtain more water on a year-round basis is by means of wells. Up to 30 mgd water can be obtained if a comprehensive system of facilities and management is developed. This system would include surface reservoirs if adequate sites can be located for storage of flood waters now largely wasted to the sea. The water is hard, but it is suitable for municipal use and for many industrial purposes with simple treatment. Most of the water is suitable for irrigation without treatment. The water in a narrow zone along the coast is brackish, but no data to date indicate active salt-water encroachment. (Knapp-USGS)

Descriptors: *Floods, *Flood damage, *Streamflow, Peak discharge, Meteorological data, Climatic data, Gaging stations, Flood plains, Flood forecasting.
Identifiers: Recurrence intervals, Drainage and storage effects.

The floods of March-May 1965 in the upper Mississippi River basin occurred as two different events, one during the latter part of February and early March and the other starting early in April and extending into May. Factors contributing to the floods were rapid melting of the winter accumulation of snow, heavy rains on the snow pack, and deeply frozen ground throughout much of the basin, which made the soil almost impervious and thereby greatly increased the amount of runoff. Peak stages and discharges during the floods exceeded previous known maxima at many points. Included in this report are peak stages and discharges for these floods at 333 sites; the previous maxima at these sites where such data are available; the recurrence interval for many sites; flood damages; effect of drainage and storage on flood peaks; and the operations of the U. S. Geological Survey and other Federal agencies during the flood emergency. (Woodard-USGS)

WATER-SURFACE ELEVATIONS AND CHANNEL CHARACTERISTICS FOR A SELECTED REACH OF THE APPLEGATE RIVER, JACKSON COUNTY, OREGON,
Geological Survey, Portland, Oreg.
D. D. Harris, and C. W. Alexander.
Geological Survey Open-file report, 1970. 42 p, 30 fig, 4 tab, 5 ref.

Descriptors: *Profiles, *Floods, *Stage-discharge relations, *Oregon, Mapping, Flood forecasting, Streamflow forecasting, Hydrologic data, Data collections, Water levels, Channel morphology, Planning, Flood plains, Flood protection, Flood control, Reservoirs.
Identifiers: Applegate River (Oreg).

Flood and low-water elevations for a selected reach of the Applegate River, Oregon from the Jackson-Josephine County line to the Applegate damsite are presented in tables and graphical profiles. Elevations for a discharge on the Applegate River equivalent to that of the flood in December 1964, but reduced by storage in the proposed Applegate Reservoir, would fall between 10- and 20-year flood elevations downstream from Beaver Creek (river mile 40.6). Upstream from Beaver Creek, the adjusted December 1964 flood would be lower than a 10-year flood. The computed water-surface profiles are generally in good agreement with the documental flood elevations. (Knapp-USGS)

FLOOD HYDROLOGY OF SMALL WATERSHEDS: EVALUATION OF TIME PARAMETERS AND DETERMINATION OF PEAK DISCHARGE,
Hawaii Univ., Honolulu. Dept. of Agricultural Engineering.
I-pai Wu.
American Society of Agricultural Engineers Transactions, Vol 12, No 5, p 655-660, 663, September-October 1969. 7 p, 11 fig, 1 tab, 19 ref. OWRR Project B-006-HI.

Descriptors: *Floods, *Hydrology, *Small watersheds, *Rainfall-runoff relationships, *Hawaii, Peak discharge, Time, Rainfall, Runoff, Streamflow, Gaging stations, Hydrographs, Equations, Parametric hydrology, Frequency analysis, Runoff forecasting, Depth-area-duration analysis, Rainfall intensity.

This paper is based on the evaluation of more than 250 hydrographs from about 30 small watersheds on the island of Oahu. The existing drainage-design criteria for the Hawaiian Islands are arbitrarily set in two groups: the rational formula is used for areas less than 100 acres where the coefficient C is revised from mainland standards. Frequency analysis or envelope curves based on maximum experience are used for watersheds larger than 100 acres. A frequency analysis for annual peak discharge was made for 23 watersheds (island of Oahu) and peak discharge of 100-year, 24-hr precipitation for the determination of peak discharge for ungaged areas. The relationship between peak discharge and runoff appears to be linear for a given watershed regardless of intensity, duration and size of the storm. The time to peak which varies slightly from different hydrographs will not change the general shape of the hydrograph or the linearity of the peak discharge and runoff relation. However, this linear relation cannot be extended beyond 6 inches of runoff. Graphs, equations, tables of data, and a map locating gaging stations are included. (Woodward-USGS)

STREAMFLOW CHARACTERISTICS OF THE NORTHEASTERN UNITED STATES,
Pennsylvania Agricultural Experiment Station, University Park.
William E. Sopper, and Howard W. Lull.
Available from NTIS as PB-192 878, $3.00 in paper copy, $0.95 in microfiche. Bulletin 766, June 1970. 141 p.
Identifiers: *Forestry, Management planning, *Rivers, United States, *Hydrology, Reviews, Periodic variations, Meteorological parameters, Fluid flow, Volume, *Streamflow characteristics, Watersheds, Northeastern United States, Seasonal runoff.

Forest watershed management research was intiated in Northeastern United States in 1948 and is continuing on 29 small, forested experimental watersheds located in New Hampshire, New Jersey, Pennsylvania, Maryland, and West Virginia. One of the common objectives of these research programs is to determine the effect of the forest cover and forest management practices on streamflow, specifically, the quantity of water yield and its time distribution, and water quality. Four studies were conducted. The first was to determine average annual and seasonal water yields, flow duration, and high daily flows for 137 watersheds and to relate these, insofar as possible, to the seven major physiographic regions in the Northeast. In the second study, the relationships of average anual and seasonal discharges, flow-duration discharges, and high daily flow discharges to selected climatic, geographic, topographic, and land-use variables were investigated. This analysis was extended in the third study to better define the relationships between the water yield parameters and the climatic and physical watershed variables within each of the physiographic regions. The fourth study was concerned primarily with the determination of the representativeness of the small experimental watersheds in relation to the physiographic region in which they are located.

HYDRAULIC GEOMETRY OF 12 SELECTED STREAM SYSTEMS OF THE UNITED STATES,
Illinois State Water Survey, Urbana.
John B. Stall.
Available from NTIS as PB-195 165, $3.00 in paper copy, $0.95 in microfiche. Illinois Water Resources Center, Urbana, Research Report No. 32, July 1970. 73 p, 25 tab, 28 fig, 32 ref, append. OWRR Project B-023-ILL (1).

Descriptors: *Channels, *Hydraulics, *Streams, *Flow, Open channel flow, Streamflow, Runoff.
Identifiers: *Re-oxygenation, Hydraulic geometry.

A completed project shows there to be, for the 18 river basins in Illinois, a consistent pattern in which the width, depth, and velocity of flow in a stream change along the course of the stream, with a constant frequency of discharge. These channel characteristics are termed hydraulic geometry and constitute and interdependent system which can be described by a series of graphs having simple form or by equations. The data from about 250 stream gaging stations will be assembled and used to develop the parameters to define the hydraulic geometry of stream systems for ten river basins selected to represent various physiographic and hydrologic regions of the humid part of the United States. These parameters are to be generalized for various physiographic divisions and used to help explain variability of other observed hydrologic phenomena such as low flow frequency, and flow-duration. These parameters will also be used to predict the average depth and velocity of flow at problem locations on the stream where no measurements are available. This will allow computation of the re-oxygenation capacity of the stream at a problem location, and the time-of-travel of contaminants through the stream system.

SIMULATION OF CONTINUOUS DISCHARGE AND STAGE HYDROGRAPHS IN THE NORTH BRANCH OF THE CHICAGO RIVER.
Hydrocomp International, Inc., Palo Alto, Calif.

Report to Northeastern Illinois Planning Commission, Chicago, Illinois, 1970. 56 p, 14 fig, 13 tab.

Descriptors: *Simulation analysis, *Streamflow forecasting, *Streamflow, *Hydrographs, *Mathematical models, *Urbanization, *River forecasting, *Flood forecasting, *Flood control, *Flood plains, *Model studies, *Watershed management, *Stage-discharge relations, *Illinois, Flow, Surface runoff, Computer models, Channel improvements, Planning, Watersheds.
Identifiers: *Chicago River.

The report summarizes streamflow simulation studies of the North Branch of the Chicago River using mathematic modeling techniques. The Northeastern Illinois Planning Commission had the studies made to aid: (1) the development of regional maps delimiting flood plains for 25, 50 and 100 year frequencies, based upon present physiographic conditions and continued urbanization; (2) evaluation of the hydrologic impact of flood control works, channel constrictions, and changes in urban development patterns. These objectives are essential for intelligent land use planning, and are required in the National Flood Insurance Program. The stream studied flows into and through the Chicago metropolitan area and is typical of watersheds in Northeastern Illinois. It has a flat stream channel gradient and broad flood plains at high discharge. Simulation studies showed that steps must be taken either to preserve the stream's perogative to flow over its flood plain, or substantially alter the stream channels as they now exist. If flood plain storage is taken for a subdivision at one point, it could be returned to the stream at another point by land purchase and excavations. Alternately, if channel storage is not preserved, large floodways, detention basins or underground caverns will be needed. Results of simulation studies of flood discharge and stage are presented by tables and graphs. (Poertner)

GROUNDWATER CONDITIONS IN UTAH, SPRING OF 1970,
Geological Survey, Salt Lake City, Utah.
C. T. Sumsion, L. J. Bjorklund, E. L. Bolke, R. W. Mower, and L. R. Herbert.
Utah Division Water Resources Cooperative Investigations Report No 8, 1970. 71 p, 36 fig, 2 tab, 7 ref.

Descriptors: *Hydrologic data, *Groundwater, *Water levels, *Utah, Hydrogeology, Water resources, Water resources development, Irrigation water, Water wells, Water level fluctuations, Recharge, Water yield, Water quality, Data collections.
Identifiers: Groundwater levels.

This report contains information on well construction, groundwater withdrawals, water-level changes, and related changes in precipitation and streamflow in Utah. It also contains supplementary data that are related to groundwater use in some areas. Less than 2% of the wells in Utah obtain water from consolidated rocks. The consolidated rocks that yield the most water are lava flows, limestone, and sandstone. More than 98% of the wells in Utah draw water from unconsolidated rocks. Most wells that tap unconsolidated rocks are in large intermountain basins, which have been partly filled with debris from the adjacent mountains. The estimated total withdrawal of water from wells in Utah during 1969 was about 670,000 acre-feet, about 40,000 acre-feet more than that reported for 1968. Precipitation during most of the growing season was less than normal in parts of the State where the largest withdrawals are for irrigation, so irrigation withdrawals increased in these areas. Although all types of groundwater withdrawals except public supply increased, water levels generally rose throughout the State from March 1969 to March 1970 as a result of above-normal precipitation. Groundwater development and changes in groundwater conditions in the major areas of groundwater development are summarized. (Knapp-USGS)

THEORY OF FLOW TO DRAINS,
Agricultural Research Service, Beltsville, Md. Soil and Water Conservation Research Div.
Jan Van Schilfgaarde.
In: Advances in Hydroscience, Vol 6, New York, N.Y., Academic Press, p 43-106, 1970. 64 p, 18 fig, 82 ref.

Descriptors: *Reviews, *Drainage systems, *Soil water movement, *Groundwater movement, Saturated flow, Unsaturated flow, Steady flow, Unsteady flow, Darcys law, Dupuit-Forchheimer theory, Water levels, Salinity, Water level fluctuations, Recharge, Discharge (Water), Hydraulic conductivity.
Identifiers: Flow to drains.

The basic principles on which the theory of fluid flow is based, developments from these principles as they apply to drainage, and their application to practical design problems are reviewed. In humid areas, the primary functions of drainage systems are: to provide an environment favorable for plant roots, and a soil-physical condition conducive to economic farming operations. In irrigated regions, the primary function is to establish or maintain a favorable salt balance in the soil. The engineer needs to know the physical properties of the soil before he can design the drainage system. Of primary concern are reliable estimates of hydraulic conductivity, depth of the water-conducting layer and pore space distribution. Flow theory permits the determination of water table heights. In principle, this approach enables the derivation of design criteria and economic evaluation. It also provides the framework for study of the response of crop plants to drainage. The review includes the Navier-Stokes and Darcy equations of motion, equations for saturated flow, and equations for unsaturated flow. Both steady and unsteady flows are discussed. Methods and theory for soil-property measurements are reviewed. Applications of theory and techniques to drainage design are outlined. (Knapp-USGS)

TWO-LIQUID FLOWS IN POROUS MEDIA,
Technion - Israel Inst. of Tech., Haifa.
Jacob Bear.
In: Advances in Hydroscience, Vol 6, New York, N Y, Academic Press, p 141-252, 1970. 112 p, 53 fig, 72 ref.

Descriptors: *Groundwater movement, *Soil water movement, *Reviews, *Interfaces, Saline water-freshwater interfaces, Saline water intrusion, Stratified flow, Oil-water interfaces, Air-water interfaces, Porous media, Flow, Diffusion, Dispersion, Mixing, Aquifers.
Identifiers: Two-liquid flow.

Some basic concepts, techniques and methods of investigation of problems involving the flow of two fluids through a porous medium are reviewed. Such problems are often encountered in groundwater hydrology and (oil) reservoir engineering. Miscible displacement or hydrodynamic dispersion is a type of two-fluid flow in which the two fluids are completely soluble in each other. A distinct fluid-fluid interface does not exist. Immiscible displacement is the simultaneous flows of two or more immiscible fluids. A distinct fluid-fluid interface separates the two fluids within each pore. In many cases of interest, the transition zone in the case of miscible fluids is relatively narrow so that for all practical purposes a fictitious abrupt interface separates the two fluids. On each side of this imaginary interface is a single phase only. This assumption appreciably simplifies the treatment of the two-fluid problem. Across the mixing zone between sea water and fresh water in coastal aquifers the density of the water varies gradually from that of fresh water to that of sea water. Artificial recharge also introduces one quality of water into an aquifer containing water of another quality. Unsaturated flow is the flow of water and water vapor through a soil in which the void space is partly filled with air. Essentially, this is a case of simultaneous flow of two immiscible fluids (water and air) except that often the assumption is made that the air is practically immobile. (Knapp-USGS)

Geological Society of America Bulletin, Vol 81, No 4, p 1217-1225, April 1970. 9 p, 6 fig, 9 ref. NSF Grant 4424.

Descriptors: *Sediment transport, *Surface-groundwater relationships, *Seepage, *Stream erosion, Permeability, Channel morphology, Roughness (Hydraulic), Mud, Sands, Sediments, Discharge (Water).
Identifiers: Stream competence.

Field observations of a small stream have indicated that seepage of water into or out of a stream may greatly alter stream competence. Theoretically, water seeping through the stream bed exerts a drag on quartz grains that changes stream competence by the factor 1.65/ (1.65-i) where i is the seepage gradient. Experiments in laboratory flumes, however, indicate that seepage through a stream bed, despite its effect on effective grain density, causes no change in competence in gaining streams nor in losing streams that lack a mud seal. Possibly the expected change in competence is partially counteracted by the accompanying changes in form drag and surface drag on the grains. Flume experiments also show that upward seepage reduces the steepness of bed forms and decreases bed roughness, whereas downward seepage steepens

the bed forms and increases bed roughness, but these changes appear to be insufficient to cause any measurable change in the slope of the water surface. Downward seepage in the presence of sufficient suspended sediment, however, can lead to the formation of a mud seal on the surface of a stream bed; this results in a great increase of the effective density of the bed sediment and may result in the total elimination of sediment entrainment from the bed. REGIONAL GROUNDWATER FLOW BETWEEN LAKE SIMCOE AND LAKE ONTARIO,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
C. J. Haefeli.
Canada Department Energy, Mines and Resources, Inland Waters Branch Technical Bulletin No 23, 1970. 42 p, 25 fig, 2 plate, 51 ref.

Descriptors: *Hydrogeology, *Groundwater movement, *Surface-groundwater relationships, *Lake Ontario, Water levels, Groundwater basins, Surveys, Aquifers, Glacial drift, Water chemistry, Water wells, Data collections.
Identifiers: Regional groundwater flow, Lake Simcoe (Ontario), Canada.

Lake Simcoe is 35 to 40 miles north of and about 470 feet higher than Lake Ontario. However, the average elevation of the Lake Simcoe Basin is only about 250 feet higher. The surface water divide within the study area of 600 square miles lies mainly between elevations 900 and 1100 feet. The relatively high elevation of the Lake Simcoe Basin, the south dipping surface and bedding of the bedrock, and especially the north-south directed, deep bedrock channels point to the possible existence of a southbound groundwater flow system. The thickness of the quaternary deposits varies considerably between Lake Ontario and Lake Simcoe. From less than 50 feet at the south-eastern shore of Lake Simcoe, the drift increases to over 400 feet in the area between Newmarket and Richmond Hill. From there, it begins to decrease southwards, becoming 25 to 75 feet thick along Lake Ontario's shoreline south and west of Toronto. Regional, extensive, well defined aquifers do not exist. The general pattern of the quaternary deposits is a body of very low permeability with enclosed high permeable lenses of various sizes. The highest transmissibility values for the most productive aquifer lenses range approximately from 40,000 to 80,000 Igpd/ft which suggests that good aquifers do exist although they may be difficult to define. Most of the pumping tests show impermeable boundary conditions. The configuration of the water table corresponds generally with the topography. Piezometric, hydrogeochemical and mathematical analyses demonstrate the non-existence of major seepage from Lake Simcoe into the Lake Ontario basin. The groundwater divide coincides approximately with the basin boundary in the quaternary deposits as well as in the different underlying bedrock formations. (Knapp-USGS)

RESULTS OF TEST DRILLING AT THE CENTRAL GREAT PLAINS FIELD STATION NEAR AKRON, NORTHEASTERN COLORADO,
Geological Survey, Denver, Colo.
Warren E. Hofstra.
Geological Survey Open-file report, June 1970. 26 p, 4 fig, 2 tab, 3 ref.

Descriptors: *Hydrologic data, *Aquifers, *Colorado, *Sampling, *Water wells, Water levels, Boreholes, Stratigraphy, Hydrogeology, Water resources, Water resources development, Maps, Cross-sections.
Identifiers: Central Great Plains Field Station (Colo).

The U. S. Geological Survey collected geologic, hydrologic and geophysical information from 16 test holes drilled at the Central Great Plains Field Station, Colorado during the period June 5 to July 3, 1969. The Field Station is located about 4 miles east of Akron, Washington County, Colo. The work was done at the request of the U. S. Department of Agriculture to obtain information on lithologic variations in the Ogallala Formation of Pliocene age. Observation wells were installed in the test holes to monitor the movement of water. This report presents the basic data collected during the test-drilling program, and a water-table contour map, a bedrock contour map, and a generalized section. Results of the test drilling, a lithologic description, and moisture content of cores are given in the tables. The geophysical logs are on file in the Colorado District Office, Water Resources Division, U. S. Geological Survey, Denver, Colo. and at the Central Great Plains Field Station, Akron, Colo. (Knapp-USGS)

GROUNDWATER RESOURCES OF THE LOWER HILLSBORO CANAL AREA, SOUTHEASTERN FLORIDA,
Geological Survey, Tallahassee, Fla.
H. J. McCoy, and Jack Hardee.
Florida Bureau of Geology Report of Investigation No 55, 1970. 44 p, 21 fig, 3 tab, 14 ref.

Descriptors: *Water resources, *Groundwater, *Hydrogeology, *Florida, Aquifers, Saline water intrusion, Water yield, Water quality, Transmissivity, Monitoring, Data collections, Hydrologic data, Water resources development, Urbanization.
Identifiers: Hillsboro Canal Area (Fla).

The lower Hillsboro Canal area occupies about 60 square miles of Palm Beach and Broward counties in southeastern Florida. All potable groundwater is obtained from the Biscayne aquifer. The aquifer extends from the land surface to a depth of about 400 feet and is composed of sand, sandy limestone, shells, and indurated calcareous sand. Municipal well fields of Deerfield Beach and Boca Raton and most of the domestic, irrigation, and industrial wells obtain adequate water supplies from permeable limestone 90 to 130 feet below land surface. Rainfall in the area and induced infiltration from controlled canals provide the recharge to the aquifer. Sea-water intrusion, although a constant threat, has not advanced inland enough to contaminate either municipal well field. Data collection stations are maintained to monitor changes of the salt-water front in the aquifer. Large quantitites of water can be withdrawn from the interior part of the area without the threat of salt-water intrusion. (Knapp-USGS)
W71-00039

HYDROGEOLOGIC DATA FOR THE LOWER ARKANSAS RIVER VALLEY, COLORADO,
Geological Survey, Denver, Colo.
Thomas J. Major, R. Theodore Hurr, and John E. Moore.
Colorado Water Conservation Board Groundwater Series Basic Data Report No 21, 1970. 125 p, 5 fig, 4 plate, 7 tab, 15 ref, append.

Descriptors: *Hydrologic data, *Groundwater, *Colorado, *Water levels, Hydrogeology, Water level fluctuations, Irrigation, Irrigation water, Water utilization, Data collections, Water resources development, Hydrographs, Water yield.
Identifiers: Arkansas River Valley (Colo).

Groundwater use as a supplemental irrigation supply in the Arkansas River valley increased substantially between 1950 and 1965. During this 15-year period about 1,000 wells were drilled. Withdrawal of groundwater by wells increased from 31,000 to 185,000 acre-feet annually in this period. The annual average withdrawal was 65,400 acre-feet for the first 5 years and 144,000 acre-feet for the last 5 years. This report presents the basic data collected during the inventory of the water resources of the reach of the valley from Pueblo to the Kansas State line. It includes maps showing the location of large-capacity irrigation, public supply, and industrial wells, records of well construction and yield, chemical analyses of groundwater, water-level measurements, and well logs. Records of 1,348 irrigation wells and 119 public supply and industrial wells are included. (Knapp-USGS)
W71-00047

GEOLOGIC MAP OF THE LOWER CACHE LA POUDRE RIVER BASIN, NORTH-CENTRAL COLORADO,
Geological Survey, Denver, Colo.
Lloyd A. Hershey, and Paul A. Schneider, Jr.
Geological Survey Open-file report, May 1970. 1 map.

Descriptors: *Maps, *Geologic mapping, *Colorado, Hydrogeology, Hydrologic data, Stratigraphy, Geological surveys, Aquifers, Water yield.
Identifiers: Cache La Poudre River basin (Colo).

A geologic map of the Lower Cache La Poudre River basin of north-central Colorado includes descriptions of water yield to wells with the lithologic descriptions of the formations mapped. The rocks of the area range in age from Precambrian to Holocene and include gneisses, conglomerates, shales, sandstones, limestones, and unconsolidated alluvium and colluvium, all of which (except the shales) yield water. (Knapp-USGS)

A STUDY IN THE GROUNDWATER HYDROLOGY OF THE MEERUT DISTRICT, UTTAR PRADESH, INDIA,
Banaras Hindu Univ., Varanasi (India). Dept. of Geography.
R. N. Mathur.
Varanasi, India, Banaras Hindu University, 1969. 109 p, 34 fig, 11 tab, 268 ref.

Descriptors: *Water resources development, *Groundwater, *Hydrologic budget, Groundwater basins, Water yield, Aquifers, Alluvium, Transmissivity, Water levels, Climates, Topography, Surveys, Water utilization, Irrigation water.
Identifiers: *India, Uttar Pradesh (India), Ganga Plain (India).

A study of the groundwater hydrology of the Meerut district in the Ganga Plain in Uttar Pradesh, India includes descriptions of climate, physiography, and geology, as well as hydrogeology. This is the first such hydrogeologic study ever made in India. An important part of the analysis is a calculation of the hydrologic budget of the area. The Ganga Plain area is being exploited for groundwater on a very large scale; the irrigation project is probably the largest in the world. The plain is a continuous and conformable series of alluvial deposits, composed of unconsolidated sand, clay, gravel and their mixtures. The older alluvium is Middle Pleistocene whereas the younger gradually passes into the Recent. Coarse sand beds, either alone or with consolidated sand, gravel or pebble beds, generally occur at relatively greater depths; whereas clay beds predominate at shallower depths. An aggregate thickness of about 100 feet of good water-bearing strata are generally present in an average depth of 300 feet. Withdrawals of more than 350 acre-feet per square mile may result in a permanent lowering of the water table and in increasing pumping costs. The present spacing of about 2 square miles per tube-well can be somewhat reduced because the area of influence per well amounts to 1 square mile. (Knapp-USGS)
W71-00057

WATER-RESOURCES APPRAISAL OF THE LOWER VIRGIN RIVER VALLEY AREA, NEVADA, ARIZONA, AND UTAH,
Geological Survey, Carson City, Nev.
Patrick A. Glancy, and A. S. Van Denburgh.
Nevada Division of Water Resources, Water Resources-Reconnaissance Series Report 51, 1969. 87 p, 4 fig, 2 plate, 2 photo, 22 tab, 52 ref.

Descriptors: *Water resources, *Surveys, *Nevada, Surface waters, Groundwater, Streamflow, Water yield, Aquifers, Water supply, Water resources development, Data collections, Hydrologic data, Hydrogeology, Water quality, Evapotranspiration.
Identifiers: Virgin River Valley (Nev).

A water-resources reconnaissance was made of the lower Virgin River Valley, Tule Desert, and Escalante Desert basin in Nevada. THE LOWER Virgin River Valley comprises the river flood plain and its tributary drainages from The Narrows, about 5 miles east of Littlefield, Arizona, downstream to the river's confluence with Lake Mead. The lower Virgin River is the dominant hydrologic feature of the area. Water contributed to the river's floodplain area includes direct precipitation, river inflow, and groundwater underflow, plus surface-and groundwater inflow from tributary drainages within the report area. Outflow includes streamflow and groundwater underflow to Lake Mead, consumptive use, and natural evapotranspiration. Most consumptive use is for irrigation of crops by diversion of surface flow. Only a small amount of groundwater is pumped for irrigation, but groundwater reservoirs furnish most of the municipal, domestic, and livestock supply. Water in the Virgin River usually contains 1,000-3,000 mg/l of dissolved solids--largely calcium, sodium, sulfate, and chloride. Groundwater along the river characteristically is very hard, and contains 500 to as much as 5,000 mg/l of dissolved solids, dominated by sulfate and sodium or calcium. (Knapp-USGS)
W71-00058

WATER-LEVEL RECORDS FOR THE NORTHERN HIGH PLAINS OF COLORADO,
Geological Survey, Denver, Colo.
Arnold J. Boettcher, Warren E. Hofstra, and Thomas J. Major.
Colorado Water Conservation Board Groundwater Series Basic-Data Release No 20, 1969. 189 p, 4 fig, 3 plate, 1 tab.

Descriptors: *Hydrologic data, *Colorado, *Water levels, *Water level fluctuations, *Water wells, Irrigation wells, Alluvium, Aquifers, Withdrawal, Data collections, Sampling, Water resources, Water yield, Hydrographs.
Identifiers: High Plains (Colorado), Ogallala formation.

The northern High Plains of Colorado is bounded by the State line on the east, the South Platte River on the north, the Arkansas River on the south, and extends west to Limon, Colo. Irrigation supplies are derived almost entirely from wells tapping the Ogallala Formation. The semiconsolidated Ogallala consists of sand, gravel, silt, and clay, and ranges in thickness from a few feet on the west to as much as 400 feet in places near the State line. Groundwater withdrawals in the area nearly quadrupled between 1960 and 1968 as the number of irrigation wells increased. In 1960 there were 480 wells and in 1968 there were 1,810 wells. Utilization of the resources at this rate has caused significant water-level declines in areas where wells are concentrated. This report presents water-level records collected by personnel of the U. S. Geological Survey and Colorado State University. A large part of this report was compiled by automatic storage and retrieval methods. Water-level measurements for each well were punched on cards and printed by a computer. In January 1964, the number of observation wells was increased from 52 to 400 to provide a better sampling of water-level changes. Measurements in the 400 observation wells also were made in 1966, and 1969, and will be made annually in the future. (Knapp-USGS)

HYDROLOGIC BASIN, DEATH VALLEY, CALIFORNIA,
Geological Survey, Washington, D.C.
Charles B. Hunt, T. W. Robinson, Walter A. Bowles, and A. L. Washburn.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402. US Geological Survey Professional Paper 494-B, 1966. 138 p, 73 fig, 3 plate, 53 tab, 139 ref.

Descriptors: *Groundwater basins, *California, *Deserts, Arid lands, Saline water systems, Brines, Sedimentation, Chemical precipitation, Hydrology, Hydrogeology, Groundwater movement, Stratigraphy, Geology, Evaporation.
Identifiers: Death Valley (Calif).

The Death Valley hydrologic basin covers about 8,700 square miles, of which about 500 square miles is below sea level. The bottom of the basin--the saltpan in Death Valley, one of the world's great saltpans--covers more than 200 square miles and lies as much as 282 feet below sea level. Death Valley is the hottest and driest part of the United States. Temperatures greater than 120 deg F are common during the summer, and a maximum of 134 deg F has been recorded. Annual rainfall in the valley averages about 1.66 inches; the average precipitation in the entire hydrologic basin probably is about 4-5 inches. The evaporation rate in Death Valley is about 150 inches per year. In the central part of Death Valley, salt deposits form a crust covering most of 200 square miles, about 10 percent of the hydrologic basin. Most of the distinctive hydrologic features of the basin are directly the result of the structural geology. Groundwater is ponded in the structural basins, and it moves from one basin to another along faults that extend through topographic divides. Groundwater also enters the basin along faults from neighboring basins. The thickness of the salt crust on the saltpan ranges from a few inches to a few feet. Under the crust is silt and clay. At the center of the pan, the salts in the crust and the brines are mostly chlorides. These chlorides are surrounded by a narrow zone in which the salts are chiefly sulfates; these sulfates, in turn, are surrounded by a sandy zone containing carbonate salts and forming the edges of the pan. This zoning reflects the differences in solubility of the salts. (Knapp-USGS)

ON THE FAUNA OF ASELIDAE IN THE BED OF A TRIBUTARY OF THE SAONE (IN FRENCH),
Dijon Univ. (France). Faculty of Science.
Jean-Paul Henry, and Guy Magniez.
Comptes Rendus Academie des Sciences, Paris, Vol 270, No 19, Serie D, p 2366-2368, 1970. 1 fig, 8 ref.

Descriptors: *Ecological distribution, *Aquatic animals, *Sediment-water interfaces, Microenvironment, Sediments, River beds, Crustaceans, Diptera, Detritus, Water analysis, Analytical techniques.
Identifiers: *Saone River (France), Subsurface water environments, Interstitial waters, Alluvial deposits, Aselidae, Proasellus.

The method of the interstitial water analysis, developed by Bou and Rouch, permitted to discover an association of four forms of Aselidae in the bed of the Ouche, a tributary to the Saone River. The presence of the two epigeoic sub-species of these crustaceans in the hypogeoic environment (80 centimeters below the benthos) demonstrated the wide ecological amplitude of these amphothalms. The coexistence of Proasellus cavaticus walteri and P c puteans indicated specific heterogeneity of P cavaticus. The distribution of Aselidae suggested the course of geologic dynamics during the quartenary period. (Wilde-Wisconsin)

POPULATION OF CIRCULATING WATER IN THE ZONE OF INTERMITTENT PERCOLATION IN THE KARSTIAN MASSIF (IN FRENCH),
Centre Nationale de la Recherche Scientifique, Moulis (France). Laboratoire Souterrain.
Bernard Delay.
Comptes Rendus Academie des Sciences, Paris, Vol 268, No 5, Serie D, p 1917-1920, 1969. 2 tab, 10 ref.

Descriptors: *Subsurface water, *Capillary water, *Crustaceans, Aquatic population, Population, Percolating water.
Identifiers: *Terrestrial fauna, Karstian massif, Stalagmites, Grottoes, France.

Samples of percolating subterranean water were collected from stalagmites of three grottoes near Castillon-Milhos, France. The filtration procedure yielded 1708 hypogeoic aquatic crustaceans in different stages of development. The organisms included the members of Cyclopoides, Harpacticides, Syncarides, and Asellides. These were accompanied by representatives of terrestial fauna, entrapped by water: Acarinas, Nematodes, Oligochaetes, Rhobdocoeles, and Rotifers. This study affirms the existence of a regular passage of hypogeolic crustaceans across the zone of intermittent percolation of karstian formation. (Wilde-Wisconsin)

THE ARCHIVES FOR GROUNDWATER LEVELS T.N.O. IN THE NETHERLANDS,
Rijksinstituut voor Drinkwatervoorziening, Delft (Netherlands).
J. H. Beltman.
Annals of Arid Zone, Vol 8, No 2, p 257-266, September 1969. 4 fig, 2 ref.

Descriptors: *Observation wells, *Groundwater, *Regression analysis, *Networks, Data collections, Governments, Hydrologic data, On-site data collections, Water table, Equations, Statistical methods.
Identifiers: *Netherlands, *Groundwater levels, Archives.

Responding to the necessity for groundwater level studies, 3 networks of observation wells--both, for artesian and phreatic water--have been established throughout the Netherlands. The networks are dependent upon the selection of 'key wells' which are observation wells representative of their areas. In most areas, simple statistical relationships exist between groundwater levels in key wells and other wells in their area. Regression lines may be calculated for levels in differing wells, and the statistical theory and its practical applications are described. Problems in measuring abnormal water levels in certain areas due to groundwater withdrawal are discussed. At the present time there are 11,342 observation wells in the country. This type of network is also applicable to areas of the arid Southwest U. S. and elsewhere. (Casey-Arizona)

GEOBOTANICAL STUDIES IN GEO-HYDROLOGICAL SURVEYS IN THE ARID ZONE OF W. RAJASTHAN,
Central Arid Zone Research Int., Jodhpur (India).
P. C. Chatterji, and R. K. Gupta.
Annals of Arid Zone, Vol 8, No 2, p 246-250, September 1969.

Descriptors: *Phreatophytes, *Arid lands, *Xerophytes, *Hydrogeology, *Groundwater, Geomorphology, Water quality, Salinity, Mapping, Petrography, Grasses, Legumes, Plant populations, Exploration.
Identifiers: *India, *Rajasthan Desert, *Geobotany, Groundwater exploration, Groundwater depth, Plant communities, Total soluble salts.

Use of geobotanical methods in groundwater exploration is based on the assumption that areal plant cover characteristics are closely correlated with geological and geo-hydrological conditions. If geobotanical methods are accurate, the areas most useful for well networks and irrigation schemes may be found fairly quickly and inexpensively. A qualitative study attempting to relate differing plant communities to groundwater depth and mineral content was made in the Luni River area of West Rajasthan where groundwater occurs at various depths and is of varied quality. Phreatophytes are extremely useful as indictors of both presence and depth of groundwater. Other plant species associated with the phreatophytes may reflect lithologic and geochemical conditions which in turn are direct or indirect indicators of groundwater quality. Areal maps of groundwater depth and total salt content correlate very closely to the map of plant communities. (Casey-Arizona)

INTERPRETATION OF HYDROGEOLOGIC DATA FOR GROUNDWATER MANAGEMENT,
Geological Survey, Denver, Colo., and Geological Survey, Washington, D.C.
John E. Moore, and Leonard A. Wood.
Annals of Arid Zone, Vol 8, No 2, p 225-230, September 1969. 7 fig, 6 ref.

Descriptors: *Analog models, *Hydrogeology, *River flow, *Groundwater basins, *Regional analysis, Model studies, Structural models, Groundwater mining, Withdrawal, Evapotranspiration, Precipitation (Atmospheric), Aquifers, Water wells, Channel flow, Streamflow forecasting, Aquifer characteristics, Water loss, Pumping, Irrigation water, On-site data collections, Channels.
Identifiers: *Arkansas River Valley (Colorado).

The Arkansas Valley of southeastern Colorado overlays a valley fill aquifer consisting of sand, gravel, clay and silt and averaging 3 miles in width. The Arkansas River is hydraulically connected with the aquifer so that the surface water and groundwater of the area constitute a common water supply, During the dry months river flow is often inadequate for irrigation needs and about 234,000 acre-feet of groundwater are therefore pumped from wells. The physical limits and character of the aquifer were described and mapped and quantitative data were obtained on groundwater levels, precipitation, evapotranspiration, and river gains and losses. River losses were greatest in those areas of greatest pumping, indicating that areal groundwater movements were greatly affected by groundwater withdrawal. With the data from field studies and extensive analog model of the Arkansas Valley hydrologic system was built in an effort to predict various withdrawal effects on the regional water economy. Initial results of 2 channel gain and channel loss analog analyses compared closely with field measurements and further water analysis projects are discussed. (Casey-Arizona)

ROCK MOVEMENT TRIGGERED BY A WATER-LEVEL CHANGE IN THE BRUNSWICK AREA, GEORGIA,
Geological Survey, Brunswick, Ga.
Dean O. Gregg.
Chapter C for sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402 - Price $3.25. In: Geological Survey Research 1970, Chapter C: Geological Survey Professional Paper 700-C, p C198 - C201, 1970. 4 p, 2 fig, 5 ref.

Descriptors: *Water level fluctuations, *Faults (Geology), *Withdrawal, *Land subsidence, *Movement, Earthquakes, Georgia, Structural geology, Stress, Strain, Artesian wells, Hydrogeology.
Identifiers: Brunswick (Ga).

Anomalous water-level fluctuations attributed to rock movement were recorded simultaneously in three wells tapping the principal artesian aquifer in Glynn County, Ga. During the time of the fluctuations, water levels in the area were rising after an industrial shutdown for the 1964 Christmas holidays and a massive reduction in groundwater withdrawals. It is postulated that the rapidly changing pressures superimposed on older unresolved stress conditions may have triggered subsidence of movement along a suspected fault zone. (Knapp-USGS)
W71-00177

NOTES ON THE POSITION OF A PHOSPHATE ZONE AND ITS RELATION TO GROUNDWATER IN COASTAL GEORGIA,
Geological Survey, Richmond, Va.
Robert L. Wait.
Chapter C for sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402 - Price $3.25. In: Geological Survey Research 1970, Chapter C: Geological Survey Professional Paper 700-C, p C202, 1970. 4 p, 2 fig, 5 ref.

Descriptors: *Aquifers, *Aquicludes, *Saline water intrusion, *Mining, *Radioactive well logging, Borehole geophysics, Subsurface mapping, Subsurface investigations, Water pollution sources, Clays, Phosphates, Mine drainage.
Identifiers: Glynn County (Ga), Phosphate mining.

Of four inflection points that occur on gamma-radiation logs from the coastal area of Georgia, three are radiation peaks marking phosphate zones in the Eocene to middle and lower miocene rocks. Point A occurs in a sand at the base of a silty clay confining bed that lies above and protects the principal artesian aquifer from sea-water intrusion. Inflection point D occurs at the contact of the Oligocene and upper Eocene limestones. Mining of the phosphate zone marked by point A would breach the silty clay confining bed above the principal artesian aquifer and would allow intrusion of sea water into it. Such sea-water instrusion would destroy the groundwater resources over a wide area of one of the Nation's largest artesian aquifers and would have dire economic consequences for this area. (Knapp-USGS)
W71-00178

NONSTEADY INFLOW TO A CHAMBER WITHIN A THICK AQUITARD,
Geological Survey, Denver, Colo.
W. W. Dudley, Jr.
Chapter C for sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402 - Price $3.25. In: Geological Survey Research 1970, Chapter C: Geological Survey Professional Paper 700-C, p C206 - C211, 1970. 6 p, 4 fig, 2 tab, 6 ref.

Descriptors: *Groundwater movement, *Aquitards, *Drawdown, *Water yield, *Transmissivity, Steady flow, Unsteady flow, Artesian wells, Excavation, Tunnel construction, Nuclear explosions, Recharge, Discharge (Water), Dewatering.
Identifiers: Leaky artesian aquifers.

Nuclear devices for underground testing must often be kept dry in chambers excavated in rocks of low permeability thousands of feet beneath the water table. For calculating the time-variable discharge to such a chamber, the chamber interval is arbitrarily treated as an aquifer, although the entire zone actually is an aquitard. Those parts of the aquitard above and below the chamber interval are treated as leaky confining beds. Combining the upper and lower recharge systems into a hydraulically equivalent system with only one recharge source allows the application of a type-curve method developed by Hantush for the constant-drawdown, leaky artesian inflow to a well. (Knapp-USGS)

A SEMIQUANTITATIVE METHOD FOR DETERMINING THE SOURCE OF SPRING-FLOW IN THE MISSOURI OZARKS,
Geological Survey, Rolla, Mo.
G. L. Feder.
Chapter C for sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402--Price $3.25. In: Geological Survey Research 1970, Chapter C: Geological Survey Professional Paper 700-C, p C214-C217, 1970. 4 p, 4 fig, 5 ref.

Descriptors: *Springs, *Discharge (Water), *Recession curves, *Missouri, *Karst, Limestones, Carbonate rocks, Surface-groundwater relationships, Artesian wells, Aquifers, Bast flow, Streamflow, Groundwater movement, Water chemistry, Carbonates.
Identifiers: Ozark Mountains (Mo).

Springflow-recession curves in conjunction with data on carbonate saturation can be used to make semiquantitative determinations of the source of springflow in the terranes of carbonate rock of the Missouri Ozarks. The recession curve having the maximum slope represents rapid local drainage through nearby sinkholes, losing streams, cave networks, and flow from the regional artesian aquifer. The curve also represents periods of maximum regional flow from the aquifer. As the local drainage is depleted, the springflow-recession curve slowly approaches the minimum slope and primarily represents flow from the aquifer. During periods when the springflow-recession curve approaches the maximum slope, the saturation of the water with respect to dolomite is low, reflecting the short residence time of the local drainage. As the minimum slope of the recession curve is approached, the saturation with respect to dolomite increases and reflects the greater distance traveled and the longer residence time of the regional artesian water. (Knapp-USGS)

GEOLOGY AND GROUNDWATER RESOURCES OF PITT COUNTY, NORTH CAROLINA,
Geological Survey, Raleigh, N.C.
Carlton T. Sumsion.
North Carolina Division of Groundwater Bulletin No 18, March 1970. 75 p, 16 fig, 2 plate, 5 tab, 21 ref.

Descriptors: *Hydrogeology, *Aquifers, *Water resources development, *North Carolina, Groundwater, Water resources, Water quality, Water wells, Artesian wells, Water yield, Transmissivity, Withdrawal, Water supply, Water levels, Data collections, Hydrologic data.
Identifiers: Pitt County (NC).

This report describes the geology and groundwater resources of Pitt County in eastern North Carolina. Mean annual precipitation in the county is approximately 48 inches. The topography of the county is typical of the Coastal Plain Province, a flat, sandy plain whose only steep slopes are along stream-valley terraces. Nearly flat-lying surficial sediments of Holocene and Tertiary age overlie strata of Cretaceous age which dip gently to the southeast. Seven major aquifers serve as sources of groundwater. Groundwater is recovered from both confined and unconfined aquifers; large quantities suitable for industrial or municipal supplies are obtained from confined aquifers. Current groundwater withdrawal is only a small percentage of recharge, and nowhere has there been an overdraft. Groundwater in the shallow unconfined aquifer is generally slightly acidic and in many cases contains objectionable amounts of iron. Brackish or saline groundwater is present in these deeper strata in the eastern part of the county. (Knapp-USGS)
W71-00188

THE SIGNIFICANCE OF PERCOLATION WATER IN LIMESTONE CATCHMENTS,
Saskatchewan Univ., Regina. Dept. of Geography.
David P. Drew.
Groundwater, Vol 8, No 5, p 8-11, September-October 1970. 4 p, 2 fig, 1 tab, 16 ref.

Descriptors: *Percolation, *Limestones, *Groundwater movements, *Karst, Aquifers, Dye releases, Tracers, Tracking techniques, Flow, Recharge, Soil water movement, Saturated flow, Unsaturated flow, Hydrogeology.
Identifiers: Percolation water, Limestone hydrology, Karst hydrology.

Water not flowing in major conduits in limestone aquifers is designated 'percolation water'. The importance of percolation water in an area is probably a function of rock type, structure and hydrologic characteristics. Experiments undertaken in England and Jamaica tracing percolation water with Pyranine suggest longer flow-through times than for water sinking at discrete points on the surface. The soil cover in an area may be in part responsible for this delay. Results from percolation water traces may be used to compile isochronal maps of limestone catchments. (Knapp-USGS)

A COMPUTER METHOD FOR PUMPING-TEST ANALYSIS,
New Mexico Tech., Socorro. Research and Development Div.
Z. A. Saleem.
Groundwater, Vol 8, No 5, p 21-24, September-October 1970. 4 p, 2 fig, 1 tab, 15 ref.

Descriptors: *Groundwater movement, *Drawdown, *Water yield, *Pumping, Water wells, Least squares method, Parametric hydrology, Computer programs, Transmissivity, Permeability, Storage coefficient.
Identifiers: Pumping tests, Aquifer evaluation.

A computer method for aquifer evaluation is based on the classifical principle of least squares. The sum of the weighted squares of differences between observed drawdowns and drawdowns calculated using theoretical drawdown equations is minimized, treating the aquifer parameters as decision variables. The method can be applied to any flow system for which analytical expressions for the potential distribution are known. The method was successfully applied to four pumping tests, two in nonleaky confined flow systems, one in a leaky confined flow system and one in an anisotropic nonleaky confined flow system. LARGE SPRINGS OF FLORIDA'S 'SUN COAST,' CITRUS AND HERNANDO COUNTIES,
Geological Survey, Tallahassee, Fla.
J. A. Mann, and R. N. Cherry.
Florida Bureau of Geology Leaflet No 9, Department of Natural Resources, 1970. 22 p, 15 fig, 1 tab, 9 ref.

Descriptors: *Springs, *Florida, Discharge (Water), Water yield, Water resources development, Water conservation, Karst, Limestones, Hydrology, Hydrogeology, Saline water-freshwater interfaces, Saline water intrusion.
Identifiers: Sun Coast (Fla), Crystal River (Fla), Homosassa Springs (Fla), Chassahowitzka Springs (Fla), Weekiwachee Springs (Fla).

Four large spring complexes in the west-central gulf coast of Florida provide most of the freshwater flow of Crystal, Homosassa, Chassahowitzka, and Weekiwachee Rivers. Combined flow of the rivers averages or exceeds one billion gallons per day, and could have supplied all of Florida's industrial and municipal water used in 1967. The spring complexes are important to the future development of the area as a tourist attraction (the largest industry) and their esthetic and natural resource value. Completed elements of hydrologic investigations in the area include: (1) extensive field reconnaissance to locate all springs and points of potential spring flow under changing hydrologic conditions; (2) detailed analysis of the amount and variation of the salinity of water from wells in the Crystal River basin; (3) determination of the elevation of the piezometric surface in the Floridan aquifer in the coastal area and approximate location of the line where the groundwater level equals sea level; (4) the continuous monitoring of the flow of Crystal River; and (5) an extensive program of recording the discharge, water level, and chemical quality of water from streams, lakes, springs, sinkholes, and wells. Caution should be used in land development so that damage to the springs, the hydrologic system feeding them, and the potable water supplies in the aquifer can be avoided or minimized. (Knapp-USGS)

GEOLOGY AND GROUNDWATER RESOURCES OF DECATUR COUNTY, KANSAS,
Geological Survey, Lawrence, Kansas.
Warren G. Hodson.
Kansas Geological Survey Bulletin 196, December 1969. 41 p, 8 fig, 2 plate, 6 tab, 35 ref.

Descriptors: *Hydrogeology, *Aquifers, *Kansas, Groundwater, Water resources, Water resources development, Data collections, Hydrologic data, Water wells, Water levels, Geology, Stratigraphy, Alluvium.
Identifiers: Decatur County (Kans).

Decatur County is a 900 sq-mi area in the High Plains section of northwestern Kansas. The climate is subhumid to semi-arid, with a mean annual precipitation of 18.42 inches. The Ogallala Formation of Tertiary (Pliocene) age overlies the Cretaceous rocks in the upland areas and is the most widespread aquifer in the county. Stream erosion has removed the Ogallala Formation along the principal valleys, but streams, through several cycles of alluviation, have subsequently deposited the more permeable sediments in the valleys. There are 2 principal aquifers in the county--the Ogallala Formation that underlies the upland areas, and the relatively narrow alluvial deposits in the 4 major stream valleys. The upland areas have more areal extent than the alluvial valleys, but the highest yielding wells are in the major valleys where most of the irrigation is practiced. Based on population figures and livestock statistics, an estimated 750 to 1,000 acre-feet of groundwater is used annually in rural areas for household and livestock purposes. Three cities use a total of about 400 acre-feet of groundwater per year. About 17,000 acre-feet of groundwater is appropriated for the irrigation of 10,500 acres. Groundwater in the county is moderately hard, but its quality is adequate for most purposes. (Knapp-USGS)

TREND-SURFACE ANALYSIS OF GROUNDWATER FLUCTUATIONS,
Missouri Univ., Rolla.
John D. Rockaway, Jr.
Groundwater, Vol 8, No 3, p 29-36, May-June 1970. 8 p, 8 fig, 8 ref.

Descriptors: *Groundwater, Groundwater basins, Mathematical analysis, Groundwater geology, Groundwater recharge, Water levels, Hydrogeology, *Water level fluctuations, Water resources, Statistical methods, Water table, Aquifers, Statistical analysis, Contours.
Identifiers: Groundwater potential, Groundwater management, *Trend-surface method, *Groundwater hydrology.

With the objective of developing techniques for guidance in selecting areas suitable for future groundwater resource development, a statistical technique of fitting polynomial trend-surfaces to groundwater levels was applied to a test site in Bartholomew County, Ind. Trend-surface maps and maps of the deviations from trend-surfaces were prepared from water-level data and evaluated to establish their relationships with the hydrogeologic regimen. A field testing program for evaluating aquifer parameters concluded that: (1) A mathematically fitted surface may be considered to approximate the water-table or piezometric surface, and is sensitive to fluctuations in the groundwater reservoir; (2) Anomalous areas of the trend-surface represent local effects superimposed on the regional base and may be explained by a particular set of geologic, hydrologic, or manmade conditions; and (3) Trend-surface analysis of hydrogeologic data is a rapid, inexpensive method for predicting and establishing areas of potential groundwater development. (USBR)

ANALYSIS OF HYDRAULIC TESTS IN HOT CREEK VALLEY, NEVADA,
Geological Survey, Denver, Colo.
George A. Dinwiddie.
Geological Survey Open-file Report USGS-474-82, June 1970. 63 p, 40 fig, 4 tab, 3 ref. USAEC Contract AT (29-2)-474.

Descriptors: *Hydrogeology, *Aquifers, *Igneous rocks, *Nevada, Permeability, Groundwater movement, Porosity, Transmissivity, Velocity, Hydraulic conductivity, Storage coefficient, Water wells, Observation wells, Tracers, On-site tests.
Identifiers: Aquifer testing, Well testing, Pumping tests.

An analysis is presented of data obtained during hydraulic tests in exploratory holes, Hot Creek Valley, Nevada. The analysis is focused on determining variations in hydrostatic head in the vertical section; transmissivity, hydraulic conductivity, storage coefficients, and velocity of groundwater movement in selected intervals; and inflow to a theoretical chamber. Hole UCe-17 penetrated alluvium, welded tuff, zeolitized bedded tuff, and tuffaceous sediments. The composite water level was 161.0 meters below land-surface datum. Hole UCe-18 penetrated alluvium, lake beds and gypsum, rhyolite, and bedded tuff. The composite water level was 59.8 meters below land-surface datum. Hole UCe-20 penetrated alluvium, welded tuff, and tuffaceous conglomerate. The composite water level was 65.5 meters below land-surface datum. Inflow to a theoretical cylindrical chamber 3.66 meters in diameter and at a depth of from 1,524.4 to 1,533.5 meters below land surface in UCe-20 was computed using a leaky artesian, constant-drawdown formula. Because of many variables and unique conditions, the computation can be considered only as an approximation. The inflow to the theoretical chamber probably would be about 14 cubic meters per day after an elapsed inflow time of about 70 days. Hole HTH-1 penetrated alluvium, welded tuff, and tuffaceous sediments. The composite water level was 168.6 meters below land-surface datum. Transmissivities ranged from 0.000248 to 43.8 cu m per day per m. (Knapp-USGS)

Descriptors: *Water resources development, *Iowa, *Groundwater, *Hydrogeology, Aquifers, Water yield, Trnsmissivity, Sandstones, Glacial drift, Water wells, Water quality, Water supply, Industrial water, Municipal water.
Identifiers: Cerro Gordo County (Iowa).

The basic geologic framework underlying Cerro Gordo County, Iowa consists of an igneous or metamorphic Precambrian basement complex overlain by consolidated sedimentary rocks of Precambrian to Cretaceous age, and unconsolidated sand, gravel, and clay of Quaternary age. Groundwater occurs in the sedimentary units of Cambrian through Mississippian age and in the glacial drift and outwash deposits. The chief aquifers are the deep Cambrian sandstones, Jordan aquifer, St. Peter sandstone, Devonian and Mississippian limestone and dolomites, and the Pleistocene glacial drift and related interglacial deposits. Groundwater in Cerro Gordo County is of suitable chemical quality for domestic industrial, or municipal use. The total dissolved solids ranges from 152 mg/liter in water from the shallow bedrock to 885 mg/liter in water from the deep Cambrian sandstones. Municipal pumpage in the county in 1968 was about 1.5 billion gallons; industrial pumpage was about 1.8 billion gallons, and most of the water was obtained from the Jordan aquifer. (Knapp-USGS)

GROUNDWATER IN GREENE COUNTY, NEW YORK,
Geological Survey, Albany, N.Y.
William G. Weist, Jr., and Ralph C. Heath.
Greene County Farm and Home News, Vol 53, No 6, p 1, 9-12, June 1970. 5 p, 6 fig.

Descriptors: *Groundwater, *Water resources, Groundwater movement, Aquifers, Aquifer characteristics, Geology, Geochemistry, Water quality, Groundwater recharge, Zone of saturation, Water table, Bedrock, Hydrologic cycle.
Identifiers: Groundwater hydrology, Unconsolidated deposits.

Water in a usable quantity can be obtained from wells in nearly every part of Greene County, New York, and, if the supply is exhausted through excessive use during the summer and fall, it will be replaced during the winter and spring. These desirable features sometimes lead to undesirable practices of waste and pollution. Groundwater is obtained in the county from both the bedrock and from the unconsolidated deposits that cover the bedrock. From the standpoint of groundwater, all the bedrock in Greene County can be lumped into three types: (1) shale, (2) carbonate rocks (such as limestone), and (3) sandstone. The unconsolidated deposits also can be lumped into three units: (1) clay and silt, (2) sand and gravel, and (3) till. Pertinent terminology is explained to insure a better understanding of groundwater hydrology. (Woodard-USGS)

GROUNDWATER IN THE PERMAFROST REGIONS OF ALASKA,
Geological Survey, Washington, D.C.
John R. Williams.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402 - Price $1.00. Geological Survey Professional Paper 696, 1970. 83 p, 25 fig, 4 tab, 270 ref.

Descriptors: *Permafrost, *Alaska, *Water resources development, *Groundwater, *Aquifers, Groundwater movement, Water quality, Water yield, Water supply, Ice, Frozen soils, Frozen ground, Saline water intrusion, Alluvium, Alluvial channels, Hydrogeology.
Identifiers: Permafrost hydrogeology.

Although groundwater in permafrost regions in Alaska occurs according to the same geologic and hydrologic principles prevailing in temperate regions, subfreezing temperatures result in profound modification of groundwater flow systems. Frozen ground is an impermeable layer which: (1) Restricts recharge, discharge, and movement of groundwater, (2) acts as a confining layer, and (3) limits the volume of unconsolidated deposits and bedrock in which liquid water may be stored. Frozen ground in many areas eliminates shallow aquifers and requires that wells be drilled deeper than in similar geologic environments having no permafrost. Local variations in the thickness, areal extent, and temperature of permafrost depend on variable thermal properties of earth materials and on local differences in the rate of heat flow from within the earth, climate, topography, vegetation,

geology, and hydrology. Groundwater occurs above, below, and locally within, permafrost. In the continuous-permafrost zone, the most economically developed sources of water are in unfrozen alluvium beneath large lakes and rivers. In the discontinuous-permafrost zone, groundwater is produced locally from shallow aquifers above permafrost of offshore bars and spits because water within or below the frozen beach deposits is saline. Identifiers: Ice-soil-water relationships.

Water at phase boundaries plays an important and in some cases the dominant role in governing heat and mass transport, electrical conduction, transmission of compression waves and other processes of importance in frozen soils. This report summarizes presently accepted concepts and information, and discusses significant advances in knowledge. Interfacial regions in frozen soils are of the following types: ice/ice (grain boundary), ice/water/air, silicate/water/silicate (interlamellar), and silicate/water/ice (extralamellar). The liquid portion of the interfacial region should be regarded as a liquid-like solution of the ionic and undissociated substances sorbed by the interface and expelled from the ice during freezing. In spite of strong interfacial forces, the interfacial water exhibits liquid-like mobility in its response to many kinds of driving forces. A zone of strong perturbation and disorder exists immediately proximate to silicate surfaces; protons of water molecules are partially delocalized and more easily dissociated. At a distance of 2 or 3 molecular diameters away from the silicate surface, the interfacial forces create a zone of enhanced order. At some farther distance, there exists a disordered transition zone similar to the ice surface as portrayed in Drost-Hansen's model. (Knapp-USGS)

OBSERVATIONS ON WATER-REPELLENT SOILS IN WESTERN UNITED STATES,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
Leonard F. DeBano.
In: Symposium On Water-Repellent Soils, Proceedings, May 6-10, 1968, University of California, Riverside, p 17-29, March 1969. 3 fig, 2 tab, 10 ref.

Descriptors: *Absorption, *Wettability, *Soil texture, *Repellents, Ecosystems, Penetration, Soil types, Soil moisture, Soil horizons, California, Soil texture, Vegetation, Topography, Soil-water-plant relationships, Diffusivity, On-site investigations, Drops (Fluids).
Identifiers: *Water-repellent soils, *Liquid-solid contact angle, *Water drop penetration time, Penetrants.

Although most soils show high affinities for water, some exhibit varying degrees of water-repellency. The degree of water repellence of a given soil may be tested by the water drop penetration time method in which a drop of water is placed on a soil sample and the time interval before absorption of the droplet by the soil is measured. Many workers classify a soil as water-repellent or non-wettable if penetration time is greater than 5 seconds. Other methods of characterizing soil repellency are measurements of the liquid-solid contact angle and diffusivity. Early and continuing observations on water-repellent soils have been made on burned over and unburned watersheds in California where surface runoff is affected. Studies of many areas in the western U. S. have shown a wide distribution of water-repellent soils ranging from alpine areas to low semiarid brushlands. Water repellency may be at least in part a function of soil texture. Coarse, sandy soils have a greater surface area for coating by a hypothesized hydrogen-bonded organic polymer. (Casey-Arizona)

WATER-REPELLENT SOILS IN SOUTHERN CALIFORNIA,
California Univ., Riverside. Dept. of Soils and Plant Nutrition.
C. Steven Holzhey.
Supported by U.S. Department of Agriculture, Forest Service, Grant No. 4000. In: Symposium on Water-Repellent Soils, Proceedings, May 6-10, 1968, University of California, Riverside, p 31-41, March 1969. 3 fig, 1 tab, 9 ref.

Descriptors: *Wettability, *Soil horizons, *Vegetation effects, *Topography, *Climates, *Ecosystems, Repellents, Plant groupings, Chaparral, Arid lands, Mountains, Mosses, Xerophytes, Shrubs, Trees, California, Rainfall, Runoff, Temperature, On-site investigations, Soil surfaces, Seasonal, Subtropic.
Identifiers: *Water-repellent soils, *Subtropical climates, *Herbs, Mesophytes.

Soil water repellence is mainly a function of soil surface horizons and may be either year-round or seasonal. Surface horizons are in turn strongly influenced by vegetation. There are 3 main climatic regions in southern California--inland desert, low elevation marine and high elevation mountain climates. The soil of the mountain regions is rich in decomposing litter from woody plants and water repellence is year-round. As trees and shrubs grade at lower elevations into chaparral, which then grades into Mediterranean-type, herb-dominated coastal communities, water repellence concurrently grades from year-round to strictly seasonal. During the long rainless coastal summer, repellence is minimal but increases sharply during the rainy season. Generally, very dry soils show little repellence. In some areas, ground mats of lichens, liverworts and moss-like species provide seasonal water-repellent cover, promoting runoff. In locales of year-round repellence, coarser sandy soils prevail. Repellent soils also occur in desert-scrub communities, but have been little studied. (Casey-Arizona)

MEASUREMENT OF CONTACT ANGLE, WATER DROP PENETRATION TIME, AND CRITICAL SURFACE TENSION,
California Univ., Riverside. Dept. of Soils and Plant Nutrition.
J. Letey.
Partially supported by U.S. Department of Agriculture, Forest Service, Grant No. 4000. In: Symposium On Water-Repellent Soils, Proceedings, May 6-10, 1968, University of California, Riverside, p 43-47, March 1969. 1 fig, 3 ref.

Descriptors: *Wettability, *Soil physics, *Surface tension, *Capillary action, Pores, Infiltration, Repellents.
Identifiers: *Liquid-solid contact angle, *Critical surface tension, *Water-repellent soils, Ethanol, Effective pore radius.

The liquid-solid contact angle has been one method of characterizing water repellency on plane surfaces, but it cannot be measured within a soil system. The height of capillary rise is a function of the liquid-solid contact angle. It is also a function of pore radius, which is difficult to measure. However, by using ethanol, which has a contact angle of 0, the pore radius can be determined and used to calculate the water contact angle. The water drop penetration method is based on the assumption that the contact angle must be greater than 90 degrees on repellent substances. It is a difficult method to use because the contact angle changes with time. The contact angle is also dependent on the liquid surface tension and in general decreases as surface tension decreases. Critical surface tension is a property of the solid, and the higher it is, the less water repellent the material is. Critical surface tension measurements of soils may lead to a simple efficient repellency indicator, but more research is needed. (Casey-Arizona)

WATER-REPELLENT SOILS AND WETTING AGENTS AS FACTORS INFLUENCING EROSION,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station; and California Univ., Riverside. Dept. of Soils and Plant Nutrition.
J. S. Krammes, and J. Osborn.
In: Symposium On Water-Repellent Soils, Proceedings, May 6-10, 1968, University of California, Riverside, p 177-187, March 1969. 1 fig, 2 tab, 13 ref.

Descriptors: *Watersheds (Basins), *Wettability, *Soil erosion, *Runoff, *Cost-benefit ratio, Chaparral, Semiarid climates, Mountains, California, Repellents, Debris avalanches, Infiltration, Grasses, Economic justification, Surfactants, Soil-water-plant relationships, Burning, Erosion control, Vegetation regrowth.
Identifiers: *Water-repellent soils, *Wetting agents, Burned-over sites, Plots.

Southern California's steep, unstable, chaparral-covered mountain watersheds often suffer devastating fires followed by great increases in rainfall runoff, debris and soil erosion. Soil tests indicated high soil water-repellence in these areas. It was therefore decided to experiment with surface wetting agents on burned over plots in the San Dimas Experimental Forest. Three plots were treated with 6.6 gallons of alkyl-polyoxyethylene ethanol per acre, resulting in: (1) 95 percent reduction in debris movement, (2) 32 percent runoff reduction after 5 moderate intensity rainstorms and (3) greatly increased grass growth. The lessened

runoff and increased soil moisture probably resulted in more grass seed retained in the area together with better germination conditions. In subsequent years both liquid and granular wetting agents were applied to burnouts in differing areas, usually with similar results. Treatments in one area reduced not only debris yield but also dry crop erosion. In the Los Angeles County Flood Control District the treatment benefit/cost ratio was about 2.5:1. Available data indicate a treatment effectiveness span of about 1 year. The results argue for selective applications in highly erodible areas with water-repellent soils. (Casey-Arizona)

WATER-REPELLENT SOILS AND ANNUAL PLANT COVER IN A DESERT SCRUB COMMUNITY OF SOUTHEASTERN CALIFORNIA,
California Univ., Riverside. Dept. of Life Sciences.
Susan Adams, B. R. Strain, and M. S. Adams.
In: Symposium On Water-Repellent Soils, Proceedings, May 6-10, 1968, University of California, Riverside, p 289-295, March 1969. 5 fig, 5 ref.

Descriptors: *Plant populations, *Xerophytes, *Wettability, *Repellents, *Soil properties, Plant groupings, Plant growth, Arid lands, On-site investigations, Physical properties, Condensation, Surveys, Shrubs, Trees, Stemflow, California, Soil-water-plant relationships, Volatility, Drops (Fluids), Vegetation, Burning, Vegetation regrowth.
Identifiers: *Water-repellent soils, Plant annuals, Plant distribution, Hummocks, Volatilization, Burned-over sites, Scrub.

Fire in a desert scrub area which produced a post-fire vegetational mosaic suggesting annual plant distribution was related to the occurrence of hydrophobic soils. To investigate this possibility plant surveys were conducted on burned and unburned Prosopis, Larrea and Cercidium hummocks. Simultaneously, soil water repellency measures were made using the drop test. In all cases hydrophobic layers were most concentrated around stem areas and were deeper in burned hummocks. These effects were somewhat less pronounced in Cercidium hummocks. Probably greater concentrations around stems resulted from stemflow. The deeper hydrophobic soil depths on burned ground probably indicate the volatilization of some substance during fires followed by condensation at greater depths. If discontinuous, these repellent layers could act to trap and hold soil water around root zones. The distribution on burned soils was uneven, with abrupt transitions to continuous distributions at unburned boundaries. Again, this effect was less emphatic around Cercidium hummocks. Distributions were largely continuous around unburned hummocks. (Casey-Arizona)

Chapter C for sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402--Price $3.25. In: Geological Survey Research 1970, Chapter C: Geological Survey Professional Paper 700-C, p C237-C241, 1970. 5 p, 7 fig, 5 ref.

Descriptors: *Nuclear moisture meters, *Soil moisture meters, Nuclear meters, Moisture content, Soil moisture, Instrumentation, On-site tests, Boreholes.
Identifiers: Neutron-meter access tubes.

A detailed study evaluated various methods for installing access tubes for a depth-type neutron-meter probe. At a small test site, soil-moisture content was determined by laboratory analysis of undisturbed volumetric samples as well as by means of a neutron-meter probe. Installation of thin-walled aluminum tubes of approximately the same diameter as that of the probe, in a hole small enough for tight contact between tube and soil, yielded the most favorable results. However, other less complicated and more economical methods of installing access tubes could be used with reasonable accuracy, if neutron-meter measurements made at the installation were calibrated against volumetric sampling at the site. Because of the depths involved in groundwater studies one of the simpler, more economical installation methods is more practical than the skintight-fit method and at the same time provides a reasonable degree of accuracy in the measurement of change in the moisture content of soils. Journal of Soil and Water Conservation, Vol 25, No 5, p 189-191, September-October 1970. 3 p, 1 fig, 1 tab, 4 ref.

Descriptors: *Soil texture, *Percolation, *Indiana, *Soil water movement, *Soil surveys, Planning, Urbanization, Land use, Soil conservation, Land development, Land management, Erosion control.
Identifiers: Land use planning.

A study was conducted in St. Joseph County, Indiana, to determine the relationship between percolation rate and soil texture. Forty sites were selected on nine soil series and relationships developed by regression analysis. A highly significant correlation was obtained on these glacial outwash, glacial till and lacustrine soils. The study determined that planning groups could use soil texture inferred from soil maps as a substitute for percolation rates. (Knapp-USGS)

THICKNESS OF SOIL SOLUM AS A PARAMETER OF PLANT-AVAILABLE WATER STORAGE CAPACITY IN SOILS UNDERLAIN BY CARBONATE ROCKS,
Missouri Water Resources Research Center, Columbia.
C. L. Scrivner, and D. A. Ruppert.
Available from NTIS as PB-195 085, $3.00 in paper copy, $0.95 in microfiche. Completion Report, Missouri Water Resources Research Center, Aug 10, 1970. 111 p, 11 tab, 33 fig, 38 ref, 3 append. OWRR Project No B-022-MO (2).

Descriptors: *Soil, *Soil water, *Limestone, *Clay content, Chert, Prairie, Forest.
Identifiers: Available water, Observed field capacity, 15 bar water, Natural vegetation, Neutron probe.

Available water storage capacities were determined by field measurement in limestone-derived soils with a range in depths to carbonate rock of 15 cm to more than 300 cm. Neutron probe access wells were installed and amounts of water were determined throughout two growing seasons. Each soil layer had a characteristic volume of water (called observed field capacity) after recharge by rain periods. At maximum depletions, water approached 15 bar contents. Equations were developed for the prediction of available water (the volume difference between observed field capacity and 15 bar water) from three soil variables; clay content, chert-stone content and depth to carbonate rock. When effects of chert and clay were accounted for the prediction equation was: Total A.W.C. — 0.11 (cm depth - 102). Depths to limestone of less than 61 cm (67 cm A.W.C.) were too shallow to support forest canopies and the natural vegetation was prairie. Forest species survived where depths were greater than 61 cm and some depletion was observed at greater than 250 cm depth. (Scrivner-Missouri)

COMPUTATION FOR CIRCULATION IN STRATIFIED LAKES,
Cornell Univ., Ithaca, N.Y. School of Civil Engineering.
Kwang K. Lee, and James A. Liggett.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY 10, Paper 7634, p 2089-2115, October 1970. 27 p, 8 fig, 17 ref, 2 append.

Descriptors: *Water circulation, *Density stratification, *Thermal stratification, *Lakes, *Mathematical models, Stratified flow, Winds, Currents (Water), Hypolimnion, Epilimnion, Topography, Mixing.
Identifiers: Stratified lakes, Upwelling.

A mathematical method is developed for calculating the steady-state, three-dimensional, wind driven circulation in a large stratified lake of arbitrary bottom topography and shape on a rotating earth. The stratification is modeled by a two-layer structure in which the hypolimnion and the epilimnion are considered as two distinct layers with different densities and eddy viscosities. The thermocline location responds sensitively to the applied wind stress and has an important effect on the circulation velocity. An off-shore wind is the primary cause of the cold water up-welling near the shore due to the movement of thermocline. The surface current velocity generally has a smaller magnitude and greater deflection angle than in the homogeneous case except near the boundaries. The volume transport is strong and in the downwind direction near the shore in the epilimnion and near the deep center in the hypolimnion. (Knapp-USGS)

THE INFLUENCE OF LAKE LEVEL FLUCTUATION AND THE THERMOCLINE ON WATER CHEMISTRY IN TWO GRADUALLY SHELVING AREAS IN LAKE KARIBA, CENTRAL AFRICA,
Nuffield Lake Kariba Research Station (Rhodesia).
S. M. McLachlan.
Archiv fur Hydrobiologie, Vol 66, No 4, p 499-510, 1970. 4 fig, 2 tab, 15 ref.

Descriptors: *Lakes, *Water level fluctuations, *Thermocline, *Water chemistry, Hydrogen ion concentration, Dissolved oxygen, Alkalinity, Conductivity, Potassium, Carbon dioxide, Sampling, Depth, Thermal stratification, Grasses, Fertilizers, Calcium, Magnesium, Ions, Temperature, Seasonal, Sodium, Phosphates, Benthic flora, Aquatic plants.
Identifiers: *Shelving areas, *Lake Kariba (Africa), Exposed flats, Bottom water, Salvinia auriculata, Potamogeton pusillus, Ludwigia stolonifera, Eragrostis, Inundation, Chironomid.

Lake level fluctuation of Kariba is basically used to control flood waters; a secondary result is naturally induced 'fallowing' of the gradually shelving areas. During 1964-1966 surface and bottom water samples from a number of depth zones between 20 centimeters and 20 meters were collected from two gradually shelving areas. With exception of the 20 centimeter and 20 meter zones, samples from all horizontal depth zones were chemically similar throughout the study period. Effects of thermal stratification, involving a decrease in pH and dissolved oxygen content and an increase in carbon dioxide, were detected in bottom water samples from the 20 meter station during the hot months, September to March. When the lake level rose, it inundated terrestrial grass and dung, and considerable changes were recorded in extremely shallow water (20 centimeters): low pH and oxygen content, high conductivity, alkalinity, carbon dioxide, concentration of potassium ions and to a lesser extent, calcium and magnesium. Although transient and restricted to gently shelving areas, these changes resulting from an annual lake level fluctuation provide a valuable source of nutrients to Lake Kariba. (Jones-Wisconsin)

BIOLOGICAL AND CHEMICAL INVESTIGATIONS ON THE EFFECT OF SEWAGE ON THE EUTROPHICATION OF BAVARIAN LAKES,
H. Liebmann.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 2, 1970. Preprint. 7 p, 5 fig, 1 tab, 27 ref.

Descriptors: *Sewage, *Eutrophication, *Lakes, Aquatic environment, Chemical properties, Phosphorus, Nitrogen, Potassium, Diversion, Algae, Nitrogen fixation, Plankton, Phytoplankton, Bacteria, Zooplankton, Salmonids, Season, Oxygen, Hydrogen sulfide, Distribution, Nannoplankton, Turbidity, Hydrogen ion concentration, Alkalinity, Carbonates, Hardness (Water), Sulfates, Conductivity, Sediments, Tertiary treatment, Nutrients.
Identifiers: *Bavaria, Schliersee, Tegernsee, Anabaena, Coregons, Lyngbya limnetica, Oscillatoria redeckei, Oscillatoria rubescens, Synedra acus, Rhodomonas, Lake Constance, Sewage canals.

Lakes Schliersee and Tegernsee in upper Bavaria were assessed for eutrophication by comparing chemical and biological characteristics before and after sewage diversion. By tertiary treatment with chemical flocculation about 90% phosphorus removal is possible, but a phosphorus residue and a relatively high amount of nitrogen remain. Thus, full canalization around the lakes and discharge of the rapidly flowing effluent after biological treatment appeared the most effective method to achieve improvement. Because climatic conditions preclude pumping sewage for great distances in middle Europe, a proposal was made that local purified sewage effluents be pumped into plastic pipes, submerged in Lake Constance for the shortest routing, where a tertiary treatment with phosphorus removal should be established for the whole sewage. Tertiary treatment may be especially advantageous if there are other lakes and impoundments downstream. Danger that leakage from plastic pipelines may introduce purified sewage into the lake seems minimal when compared to the fact that other possible solutions to the problem may defer the remedy for so long that the eutrophication processes become almost irreversible. (Jones-Wisconsin)
W71-00117

CONTRIBUTION OF RANGE LAND RUNOFF TO LAKE EUTROPHICATION,
Guelph Univ. (Ontario). Dept. of Soil Science.
F. R. Campbell, and L. R. Webber.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 2, 1970. Preprint. 6 p, 1 fig, 4 tab, 10 ref.

Descriptors: *Eutrophication, *Runoff, *Ranges, Nitrogen, Phosphorus, Silica, Seasonal, Lakes, Sampling, Potassium, Aquatic weeds, Water quality, Aquatic weed control, Agricultural watersheds, Sediments, Harvesting, Dredging, Control, Analytical techniques, Nutrients.
Identifiers: Canal Lake (Canada), Myriophyllum spicatum.

Canal Lake (Ontario) is partially defined relative to water quality, weed growth, and nutrient loadings during May 1968-May 1969 inflows. Precipitation contributes directly 73% of nitrogen found in major streams discharging into the lake. Agricultural sources of nitrogen contribute about 0.565 pounds/acre, a figure less than 1/5th of the lowest nitrogen estimate in drainage from a nonfertilized agricultural area. About 1/3rd of the total phosphorus entering Canal Lake presumably originated in insoluble organic forms from weed growth. The nitrogen and phosphorus load in Canal Lake, excluding sediments, is about ten times the annual nitrogen and phosphorus stream inflow. This concentration of phosphorus, higher than in inflowing streams, indicates another phosphorus source sufficient to overcome the diluting streamflow effect. Perhaps the greatest sources of nutrients lie within the lake itself: fall-spring filling and retaining a high nutrient inflow percentage, lake sediments, and decay and release of nutrients from aquatic plants. Septic tanks and weeping tiles are probable nutrient sources. A solution would be prevention of further plant nutrient additions and removal of those present. Chemical controls may be temporarily effective locally. Dredging programs may be warranted. (Jones-Wisconsin)

RECONNAISSANCE BATHYMETRY OF PYRAMID LAKE, WASHOE COUNTY, NEVADA,
Geological Survey, Washington, D.C.
E. E. Harris.
For sale by US Geological Survey, Washington, DC, 20242--Price $0.50. Geological Survey Hydrologic Investigations Atlas HA-379, 1 sheet, 1970. Text, 3 fig, 2 tab, 2 ref.

Descriptors: *Lakes, *Nevada, *Surveys, *Bathymetry, Contours, Depth, Lake morphometry, Measurement, Sounding.
Identifiers: *Pyramid Lake (Nev).

Pyramid Lake, about 30 miles northeast of Reno, Nev., is the terminal water body of the Truckee River system. The principal inflow to the lake is from the Truckee River; local drainage around the lake contributes little. The only outflow is by evaporation. Diversions from the Truckee River for irrigation began about 1860, and they were accelerated considerably following construction of the Truckee Canal in 1905. From 1909 to 1968 the lake level declined from an altitude of 3,869 feet to 3,789 feet above sea level, or 80 feet in 59 years. For the present bathymetric survey, section corners and east-west section lines were used to locate accurately the present shoreline and control points for the fathometer survey grid. A boat-mounted recording fathometer was used to obtain cross-sectional profiles of the lake bottom. Twenty-three cross-sectional profiles were run in an east-west direction at one-mile intervals. One long profile was run roughtly north-south from The Needle Rocks to Anaho Island. Aerial photography was obtained to provide details on the present shoreline configuration. The fathometer profiles and aerial photographs were used to contour the lake bottom. (Knapp-USGS)

A METHOD FOR OBTAINING ANALYTICAL SOLUTIONS TO THE EQUATION FOR WIND-DRIVEN CIRCULATION IN A SHALLOW SEA OR LAKE,
National Aeronautics and Space Administration, Cleveland, Ohio. Lewis Research Center.
Marvin E. Goldstein, Willis H. Braun, and Richard T. Gedney.
For sale by NTIS as NASA TN D-5989, price $3.00 in paper copy, $0.95 in microfiche. National Aeronautics and Space Administration Technical Note, NASA TN D-5989, September 1970. 56 p, 13 fig, 11 ref.

Descriptors: *Water circulation, *Lakes, *Winds, *Currents (Water), *Seiches, Topography, Lake basins, Lake beds, Lake morphology, Wind pressure, Wind velocity, Wind tides, Equations, Mathematical studies.
Identifiers: Ekman drift, Lake circulation.

A technique is given for obtaining solutions to a class of partial differential equations including Welander's equation for the wind-driven circulation in shallow seas and lakes. The technique, together with some results based on conformal mapping, is used to solve Welander's equation for a closed body of water. To illustrate the principles involved, the method is used to obtain the complete analytical solution for an elliptically shaped body of water with a particular choice of bottom topography when the depth is greater than one-half the Ekman friction depth. SILICATE MINERAL STABILITY AND MINERAL EQUILIBRIA IN THE GREAT LAKES,
Syracuse Univ., N.Y. Dept. of Geology.
Jeffery C. Sutherland.
Environmental Science and Technology, Vol 4, No 10, p 826-833, October 1970. 8 p, 5 fig, 5 tab, 30 ref.

Descriptors: *Water chemistry, *Great Lakes, *Silica, *Clay minerals, Equilibrium, Saturation, Leaching, Glacial drift, Aqueous solutions, Mineralogy, Provenance.
Identifiers: Mineral equilibria (Lake water).

Equilibrium concepts involving silicate minerals and water are applied to chemical data from the North Channel and Lakes Erie, Ontario, and Huron, for understanding of chemical self-regulation in the Great Lakes. Equilibria involving silicates and water are inferred from aqueous chemical data. Concentrations of dissolved silica in surface waters of the remote lakes are attained through dissolution of kaolinite. In deeper waters, metastable equilibria, Ca montmorillonite — gibbsite and muscovite — gibbsite may impose upper limits upon concentrations of silica. Silica concentrations in the enclosed waters of sediments from North Channel reach metastable equilibrium with

amorphous silica. The major chemical character of the Great Lakes is inherited from the carbonate-silicate mineralogy of bedrock, soils, and glacial drift in their drainage. (Knapp-USGS)

DRIFT-BOTTLE STUDY OF THE SURFACE CURRENTS OF LAKE SUPERIOR,
Northern Michigan Univ., Marquette; and Michigan Univ., Ann Arbor.
John D. Hughes, John P. Farrell, and Edward C. Monahan.
Michigan Academician, Michigan Academy Science, Arts and Letters, Vol 2, No 4, p 25-31, Spring 1970. 7 p, 2 fig, 6 ref.

Descriptors: *Currents (Water), *Lake Superior, *Data collections, *Drift bottles, Drifting (Aquatic), Flow, Hydrologic data.
Identifiers: Lake Superior currents.

A total of 2436 drift bottles has been released from 205 different stations in Lake Superior since 1966. By Jan. 1, 1969, 237 drifters were returned out of the 2436 released--an overall return of 11 percent. There appears to be a general counter-clockwise current around the entire perimeter of the lake. A broad current flows eastward along the entire south shore during all seasons that drifters were put into the lake. When this current reaches the southeastern corner of the lake it turns counter-clockwise and follows the eastern shore as far as Rossport, in the northernmost part of the lake. From Rossport the current continues its counter-clockwise movement around the lake by turning southwestward but drifts away from the shoreline as it encounters bottom water that wells upward along the entire northwestern side of the lake. WHITE SUCKER SPAWNING AND CULTURE OF THE YOUNG IN THE LABORATORY,
National Water Quality Lab., Duluth, Minn.
John G. Hale.
The Progressive Fish-Culturist, Vol 32, No 3, p 169. FWQA Project ETK 18050 ---9/70.

Descriptors: *Fish reproduction, Life history, Studies, *Spawning, Fish diets, Fish growth, Bioassay methods.
Identifiers: *Fish culture, Catostomus commersoni.

White suckers (Catostomus commersoni) collected from a lake inlet were placed in a rectangular tank at inlet water temperature (16C) and provided with a coarse gravel substrate. About 40 hours after the fish had been placed in the tank, eggs were found and after 7 days hatching was about 90 per cent complete. Larval fish were offered live brine shrimp and ground commercial trout starter 3 days after hatching. Seven days after hatching brine shrimp were found in 54 per cent of the fish; trout starter in only 15 per cent. About 1 month after hatching, commercial trout granules (No. 1) and trout starter were fed at a 50:50 ratio, replacing the brine shrimp. Thereafter, the trout food was found in 90 to 95 per cent of the stomachs. One week after hatching, the fish were 12 to 13 millimeters long; 3 months later they were 20 to 34 millimeters long. EFFECTS OF ZOOPLANKTON ON PHOTOSYNTHESIS BY ALGAE IN LAKES,
Richmond Univ., Va. Dept. of Biology.
John W. Bishop.
Completion Report, Water Resources Research Center, Virginia Polytechnic Institute and State University, Blacksburg, October 1970. 4 p. OWRR Project No A-022-VA (1).

Descriptors: Aquatic productivity, *Vertical migration, Impounded waters, Lakes, *Zooplankton, *Algae, *Photosynthesis.

The objective was to measure the extent to which zooplankton control natural populations of algae. Algae with different concentrations of zooplankton were enclosed in aquariums in Westhampton Lake, Virginia. Properties of the water, algae and zooplankton within and without the aquariums were measured over several days. Of the zooplankton examined, rotifers, cladocerans and copepods, only rotifers significantly affected photosynthesis. Rotifers at a concentration of 1,000 animals liter-1, the average for the summer, decreased photosynthesis 0.125 ppm 0 sub 2 hr-1 daily. This value represents 22% of the average rate of photosynthesis. None of the zooplankton significantly affected photosynthetic efficiency, photosynthesis per unit chlorophyll. Daily variations in photosynthesis were correlated with rainfall. Photosynthesis increased several days after rainfall. The increase resulted not from increased chlorophyll, but from increased photosynthetic efficiency of the algae. (Bishop-Richmond)

2I. Water in Plants

REVEALING BY PHYSICAL PROCEDURE THE SHORT-DURATION FLUCTUATIONS IN THE DENSITY OF VEGETATION OF MOUNTAIN STREAMS. DEFINITION OF A NEW BIOLOGICAL TEST IN WATER ANALYSIS, THE BIOCHEMICAL DEMAND FOR MINERAL SALTS (IN FRENCH),
Bernard Serra-Tosio.
Comptes Rendus Academie des Sciences, Paris, Vol 270, No 6, Serie D, p 1167-1170, 1970. 1 fig, 4 ref.

Descriptors: *Streams, *Sampling, *Aquatic plants, Analytical techniques, Water analysis, Biochemistry, Nutrient requirements, Demineralization, Phytoplankton, Test procedures.
Identifiers: Biological activity, Mineral salts, 'Nychthemeralic' drift, Biological test, Aquatic vegetation density.

Analyses of river water performed in 4-hour intervals have indicated that variation in the concentration of soluble salts is correlated with the time of sampling and corresponding biological activity. Incubation of water samples in the laboratory for 4 to 6 days at 20-23C produced a considerable demineralization of water which nevertheless exhibited a similar diurnal variation in its salt concentration. The differences between the results of analyses, performed at the same time of day and expressed in milligram/liter, are designated as the biochemical demand for mineral salts. Determination of this value is said to provide a picture of the diurnal 'drift' in vegetation density. (Wilde-Wisconsin)

Weed Science, Vol 17, No 3, p 304-306, July 1969. 3 p, 2 fig, 1 tab, 10 ref. OWRR Project B-001-ORE (1).

Descriptors: *Path of pollutants, *Herbicides, *Translocation, Weed control, Wheat, Soil moisture, Soil temperature, Pesticide kinetics, Soil water movement, Osmosis, Moisture stress, Water requirements.
Identifiers: Diuron.

Rates of photosynthesis, respiration, and transpiration of wheat were determined as functions of time, under controlled conditions of moderate soil water stress and soil temperature, after treatment of the roots with 3- (3, 4-dichlorophenyl)-1, 1-dimethylurea (diuron). Air temperature, relative humidity, light intensity, and air movement were maintained constant. The rate of photosynthesis declined with time for all plants treated with diuron but not for the controls. No change in the rate of respiration was detected. The rate of transpiration decreased slightly immediately upon application of the diuron and then remained constant. Soil temperature and soil water stress play important roles in the herbicidal action of diuron applied to the soil. (Knapp-USGS)

2J. Erosion and Sedimentation

SEDIMENT SAMPLING EFFICIENCY OF SLOTS,
Iowa Univ., Iowa City; and Technion - Israel Inst. of Technology, Haifa.
Michael Poreh, Abraham Sagiv, and Ido Seginer.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY 10, Paper 7637, p 2065-2078, October 1970. 14 p, 14 fig, 4 ref.

Descriptors: *Sampling, *Bed load, *Sediment load, Sediment transport, Particle size, Open channel flow, Alluvial channels, Instrumentation, Hydraulic models.
Identifiers: Bed-load samplers, Slots.

The sediment sampling efficiency of two-dimensional slots in open channel was studied. Eight fractions of sand and gravel were used ranging in size from 0.2 mm to 4.5 mm. A universal relation between the efficiency, the Froude number and the particle size was established for what is termed the bed load transport range. It was found that the sampling efficiency in this range decreases slightly with particle size and approaches one for large slots openings. The sampling efficiency of smaller particles, which do not move as bed load, was found to increase with particle size but remained smaller than one even for extremely large slot size to particle size ratios. Albert R. LeFeuvre, Hilmi D. Altinbilek, and Marion R. Carstens.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY 10, Paper 7636, p 2051-2063, October 1970. 13 p, 7 fig, 2 tab, 6 ref, append.

Descriptors: *Stream erosion, *Bed load, *Sediment transport, Fluid friction, Density, Velocity, Scour, Deposition (Sediments), Dunes, Channel morphology, Sedimentary structures, Hydraulic models.
Identifiers: Drag, Lift.

A function expressing the rate of removal of bed is presented in terms of the following variables: Local velocity; coefficient of drag; particle diameter; bed slope; angle of repose; and fluid density in the vicinity of the particle. The variables of the function are established by consideration of the forces acting on a typical surface particle. The functional relationship was established by the results of an experimental study. The sediment-pickup function is formulated as a local rate of bed removal in order to be able to incorporate the function in the differential form of the equation of continuity. (Knapp-USGS)

EXPERIMENTAL INVESTIGATION OF FORM OF BED-ROUGHNESS,
Southeastern Massachusetts Univ., North Dartmouth, Dept. of Civil Engineering.
Sat Dev Khanna.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY 10, Paper 7623, p 2029-2040, October 1970. 12 p, 12 fig, 7 ref, append.

Descriptors: *Channel morphology, *Roughness (Hydraulic), *Open channel flow, *Bed load, *Sediment transport, Dunes, Ripple marks, Turbulent flow, Turbulence, Pressure, Waves (Water), Friction, Fluid friction, Hydraulic models.
Identifiers: Drag, Form drag.

Experimental observations regarding mean velocity distribution, angle of flow, static pressure distribution and longitudinal turbulence intensity are all made along a typical wooden wave in the domain of ripples and dunes of river flow. The wave was produced in a low-turbulence wind tunnel and the measurements were made by hot-wire anemometry in an air medium. From these observations skin friction coefficient, form drag, and other boundary layer parameters have been evaluated to help analyze the process of sediment transport. (Knapp-USGS)

SEDIMENT YIELDS OF WISCONSIN STREAMS,
Geological Survey, Washington, D.C.
S. M. Hindall, and R. F. Flint.
For sale by US Geological Survey, Washington, DC 20242 - Price $0.75. Geological Survey Hydrologic Investigations Atlas HA-376, 1 sheet, 1970. Text, 1 fig, 4 map, 1 tab, 15 ref.

Descriptors: *Sediment yield, *Wisconsin, *Sediment load, Provenance, Glacial drift, Loess, Erosion, Maps, Survey, Data collections, Sampling, Gaging stations.
Identifiers: Sediment yield map.

The purpose of this 1-sheet hydrological atlas is to describe the magnitude and variability of sediment in Wisconsin streams, to relate sediment yields to the local environment, and to identify areas that need further study. The report is based on sediment data from 44 stream-gaging sites throughout the State. The average concentration of sediment for the 44 sampled sites throughout the State is 157 mg/liter. Annual basin yields range from 5 to 700 tons per square mile and from 0.5 to 230 acre-feet of sediment volume. Soil types, parent glacial deposits, land use and cover, and topography greatly influence sediment yields. Lowest yields generally come from forested, sandy areas with low topographic relief. The highest yields are from land that is intensely farmed, hilly, and partly covered by loose wind-blown silt. Intermediate yields are from areas of intense agricultural development, where tilled soils are exposed to erosion during a large part of each year. The sediment yield map, prepared from calculated long-term yields and by inference from knowledge of land use, soils, and glacial geology, shows in most areas of the State. (Knapp-USGS)

CARBON-14 CONTENT AND ORIGIN OF CALICHE,
Arizona Univ., Tucson. Dept. of Geology.
Joel J. Sigalove.
MS Thesis, Arizona University Graduate College, 1968. 64 p, 10 fig, 4 tab, 45 ref.

Descriptors: *Caliche, *Deposition (Sediments), Radioactive dating, Hardpan, Calcium carbonate, Leaching, Chemical precipitation, Evaporation, Limestones, Soil chemistry, Water chemistry, Soil water movement, Groundwater movement, Arizona.
Identifiers: San Francisco Volcanic Field (Ariz).

Caliche on various surfaces of known relative age was studied in the San Francisco Volcanic Field near Flagstaff, Arizona. Laboratory studies included carbon-14 analyses of the samples from vertical sections in the southern part of the state. Some caliche is deposited by the evaporation of water in the crevices and on the bottom surface of calcium-rich rocks lying upon the land surface. Most caliche is deposited by the evaporation of water infiltrating through the unsaturated zone. Carbon-14 activity decreases with depth in any given vertical section. In the San Francisco Field, the carbon-14 concentrations of caliche deposits on the younger volcanic surfaces were higher than those found for the

thicker deposits on the older surfaces. Caliche appears to be presently forming at an appreciable rate on surfaces within the San Francisco Volcanic Field. (Knapp-USGS)

A METHOD OF COMPUTING SOIL MOVEMENT THROUGHOUT A FIELD,
Agricultural Research Service, Beltsville, Md. Hydrograph Lab.; and Minnesota Univ., Minneapolis. Dept. of Agricultural Engineering.
C. A. Onstad, C. L. Larson, L. F. Hermsmeier, and R. A. Young.
American Society of Agricultural Engineers Transactions, Vol 10, No 6, p 742-745, 1967. 4 p, 7 fig, 2 tab, 4 ref.

Descriptors: *Soil erosion, *Forecasting, Equations, Runoff, Profiles, Topography, Soil conservation, Model studies, Slopes, Terracing.
Identifiers: Soil erosion forecasting.

An erosion model was designed to provide a basis for computing soil losses with consideration of local variations in slope steepness. The model is useful in obtaining a distribution of net soil loss throughout a topographic profile of any type. A profile classification and terminology are proposed. For curved profiles, the model represents some improvement over an estimate based on mean slope steepness. The model is applicable primarily to the case of two-dimensional erosion, that is, where runoff and erosion occur along parallel lines. Modification would permit consideration of the general case of three-dimensional erosion, where erosion takes place along nonparallel lines. (Knapp-USGS)
W71-00069

ADSORPTION AND DESORPTION OF INORGANIC PHOSPHORUS BY LAKE SEDIMENTS IN A 0.1 (MOLE) NaCl SYSTEM,
Wisconsin Univ., Madison. Dept. of Soil Science.
J. D. H. Williams, J. K. Syers, R. F. Harris, and D. E. Armstrong.
Environmental Science and Technology, Vol 4, No 6, p 517-519, 1970. 2 tab, 11 ref. OWRR Project B-022-WISC.

Descriptors: *Adsorption, *Inorganic compounds, *Phosphorus, *Sediments, *Lakes, Sodium chloride, Calcium compounds, Sampling, Wisconsin, Productivity, Oxygen, Hypolimnion, Thermal stratification, Eutrophication, Oligotrophic, Retention.
Identifiers: *Desorption, Lake Mendota (Wis), Wisconsin lakes, Calcareous lake sediments, Noncalcareous lake sediments, Adsorption-desorption.

Results of investigations of adsorption and desorption of inorganic phosphorus in a 0.1 mole sodium chloride system by lake sediments of contrasting chemical composition are described. Sediments were sampled from Wisconsin lakes. Noncalcareous sediments generally adsorbed and retained more added inorganic phosphorus than calcareous lake sediments. Sediments retaining the most added phosphorus during adsorption tended to release the least phosphorus during a subsequent desorption at all levels of added phosphorus. Net amount of added phosphorus adsorbed (following adsorption and desorption) was lowest for calcareous sediments--with one exception--at the highest level of added phosphorus (50 micrograms of phosphorus/milliliter). Reactions involved in adsorption and desorption of added phosphorus were not always completely reversible during the experimental period. A close relationship was found between the order of sediment capacity to retain added phosphorus in the laboratory and the levels of native total phosphorus and inorganic phosphorus in the sediment. No consistent relationship appears to exist between lake eutrophication and phosphorus retention capacity; apparently, the state of lake eutrophication cannot be explained solely on the basis of capacity of sediments to retain phosphorus. A METHOD OF ESTIMATING ANNUAL SUSPENDED-SEDIMENT DISCHARGE,
Geological Survey, Tacoma, Wash.
Leonard M. Nelson.
Chapter C for sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402--Price $3.25. In: Geological Survey Research 1970, Chapter C: Geological Survey Professional Paper 700-C, p C233-C236, 1970. 4 p, 5 fig, 1 tab, 1 ref.

Descriptors: *Sediment load, *Suspended load, *Sediment transport, *Discharge (Water), *Sediment discharge, Peak discharge, Streamflow, Sediment yield, Washington, Hydrogeology, Gaging stations, Sampling, Statistical methods, Data collections, Hydrologic data.
Identifiers: Streamflow-sediment discharge relations.

A simple method is proposed for estimating annual suspended-sediment discharge during years for which stream-flow records are available but for which sediment records are not available. Readily accessible information on the parameters of annual peak and annual mean water discharges is used with the available sediment records to estimate the average annual suspended-sediment discharge. The relation between the two parameters and the annual suspended-sediment discharge is well defined for many streams. This relation does not fit all streams, however, and a thorough understanding of a basin's geologic and hydrologic characteristics is needed for application of the method proposed. (Knapp-USGS)

GLACIAL EROSION, ICE RAFTING, AND GLACIAL-MARINE SEDIMENTS: ANTARCTICA AND THE SOUTHERN OCEAN,
Florida State Univ., Tallahassee. Dept. of Oceanography.
Detlef A. Warnke.
Amerian Journal of Science, Vol 269, No 3, p 276-294, October 1970. 19 p, 2 fig, 2 tab, 79 ref. NSF Grants GA-264, GA-657, and GA-1320.

Descriptors: *Glaciers, *Erosion, *Sediment transport, *Glacial drift, *Antarctic, Regimen, Icebergs, Rheology, Scour, Sedimentation, Sedimentation rates, Sediment load.
Identifiers: Antarctica, Glacial erosion efficiency.

The Antarctic continent is surrounded by glacial-marine sediments deposited by melting icebergs. Modern Antarctic glaciers and icebergs, however, carry no or very little debris. This points to a period of heightened erosional efficiency at some stage in the early development of Antarctic glaciation. The results of field studies in the ice-free areas of the continent, as reported in the literature, seem to confirm this view. The period of maximum efficiency was gradually phased out when easily erodible, weathered material was no longer available, or when the ice-substrate boundary conditions changed over significant portions of the continent, or when some form of geomorphic equilibrium was attained. These various explanations are not mutually exclusive; they are in part interrelated. The overall decrease in erosional efficiency of Antarctic glaciers is reflected in available deep-sea core descriptions. Additional studies aimed to confirm, modify, or reject this view and to define the newly demonstrated ice-sheet fluctuations offer promising avenues for further sediment-petrographic investigations of Antarctic core material. DIMENSIONAL ANALYSIS OF ALLUVIAL CHANNELS WITH SPECIAL REFERENCE TO MEANDER LENGTH,
Hydraulics Research Station, Wallingford (England).
Peter Ackers, and F. G. Charlton.
Also published in French. Journal of Hydraulic Research, Vol 8, No 3, p 287-316, 1970. 30 p, 4 fig, 1 tab, 26 ref.

Descriptors: *Alluvial channels, *Meanders, *Channel morphology, *Discharge (Water), *Sediment load, Sediment transport, Sands, Open channel flow, Data collections, Particle size, Hydraulic models, Dimensional analysis.
Identifiers: Meander length.

Discharge, sediment load, hydraulic gradient and channel geometry were measured in channels in an area of fine sand which achieved a meander pattern through natural processes, at discharges between 0.006 and 0.09 cu m/sec. Channels with small sediment loads remained straight and meandering occurred naturally at higher sediment loads. Dimensionless parameters were derived which provide a good framework for the analysis of stream geometry. No simple relation between meander length and discharge is completely satisfactory and none of the many empirical relations between meander length and discharge appears to have special physical significance. (Knapp-USGS)

SOME GEOLOGICAL CHARACTERISTICS OF SEDIMENTS FROM THE NORTH ATLANTIC OCEAN,
Utrecht Rijksuniversiteit (Netherlands). Vening Meinesz Lab. for Geophysics and Geochemistry.
C. H. Van der Weijden, R. D. Schuiling, and H. A. Das.
Marine Geology, Vol 9, No 2, p 81-99, September 1970. 19 p, 7 fig, 2 tab, 19 ref.

Descriptors: *Bottom sediments, *Water chemistry, *Geochemistry, *Atlantic Ocean, Clay minerals, Oceans, Mineralogy, Sampling, Ion exchange, Salts, Saline water systems, Clays, Analytical techniques, Chemical analysis.
Identifiers: Sedimentary geochemistry.

Eh- and pH-meansurements were made in a number of North Atlantic deep-sea sediments. Ten cores with marked changes in redox potential were analyzed for Si, Al, Na, K, Cl, Fe, Mn, Co, Sc, Cu, and carbonate. A significant correlation was found between Eh and Mn-content. Fe, Co, and Sc are correlated with the illitic clay-content, while no relation was found between Cu and any other main constituent. The examined sediments chiefly consist of calcium carbonate, quartz, feldspars, and illitic clays. (Knapp-USGS)

FORMATION OF THE BARRIER SPIT AND OTHER SAND RIDGES NEAR CHILKA LAKE ON THE EAST COAST OF INDIA,
Washington Univ., Seattle. Dept. of Oceanography.
K. Venkatarathnam.
Marine Geology, Vol 9, No 2, p 101-116, September 1970. 16 p, 6 fig, 2 tab, 20 ref. USGS Contract 14-08-0001-10924.

Descriptors: *Sedimentation, *Sedimentary structures, *Sand bars, *Sand spits, Coasts, Currents (Water), Sediment transport, Geomorphology, Waves (Water), Lagoons, Provenance.
Identifiers: Spits, India, Chilka Lake (India).

Chilka Lake is a lagoon on the east coast of India. It is separated from the Bay of Bengal by a barrier spit attached at the southern end. Landward of the spit, but adjacent to it, are a number of other sand ridges, some of which are parallel to the coast. The morphology and composition of the sediments forming the spit and other ridges, the bathymetry of the continental shelf off Chilka Lake, the waves and wave refraction, and the tidal and river currents in the region are described. Considerable quantities of sand for the building of the spit and the other ridges were derived from the adjacent seabed and/or from the land south of Chilka Lake. The processes of deposition of the spit and the ridges were initiated sometime during the last sea-level rise, before 3,750 years B.P. Constructive wave action and northward drift were the main processes in the building of the spit from the southern part where there is an abrupt curvature in the solid coastline. The changes in the orientation of the spit are due, in particular, to the differences in the shelf gradients off the coast, the absence or presence of strong river and tidal currents, and the pattern of wave refraction. Marine Geology, Vol 9, No 2, p M6-M11, September 1970. 6 p, 3 fig, 3 tab, 10 ref. ONR Contract 2216 (05), NSF Grant GP 3373.

Descriptors: *Sedimentary structures, *Sands, *Magnetic studies, Oceanography, Ocean currents, Marine geology, Tides, Topography, Coasts, Deposition (Sediments), Sedimentation.
Identifiers: Magnetic fabric (Sediments), La Jolla (Calif).

The magnetic fabrics of seven oriented box cores taken in water depths less than 100 m near La Jolla, California are described. All are fine sands and except a relict beach sediment, all appear to have been in sedimentary equilibrium with present conditions. They show signs of burrowing. The present magnetic fabric of all samples show signs of distrubance. Four of the seven retain sufficient primary fabric for a current direction to be estimated. There is evidence that the fabric disturbance is a result of the organic activity. (Knapp-USGS)
W71-00367

EVIDENCE OF SEDIMENTATION BY GRAVITY-ASSISTED BOTTOM CURRENTS IN THE MEDITERRANEAN SEA,
Florence Univ. (Italy). Inst. of Geology; and SACLANT ASW Research Centre, La Spezia (Italy).
C. Bartolini, and G. E. Gehin.
Marine Geology, Vol 9, No 2, p M1-M5, September 1970. 5 p, 3 fig, 5 ref.

Descriptors: *Sedimentation rates, *Oceans, *Turbidity currents, Deposition (Sediments), Sediment distribution, Sediment transport, Bottom sediments, Sampling, Oceanography, Stratification.
Identifiers: Mediterranean Sea.

Differences in the sedimentation rates of hemipelagic muds in the western Mediterranean were estimated by sampling. Within a water depth difference of 9 m, corresponding to a distance on the sea bottom of only 5 nautical miles, the sedimentation rate doubles from about 20 cm/1,000 year towards the basin rims, to 40 cm/1,000 year in the topographic lows of the basin center. The 'rain of sediment' process is ruled out as the principal deposition agent. The turbidity-current and normal-current hypotheses are briefly discussed as the most realistic alternatives. The lateral variations of the sedimentation rates are rather constant during the investigated time span, approaching 15,000 years. (Knapp-USGS)

BEACH CHANGES BY EXTRAORDINARY WAVES CAUSED BY HURRICANE CAMILLE,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
Choule J. Sonu.
Louisiana State University Coastal Studies Institute Bulletin No 4, p 35-45, Technical Report 77, February 1970. 11 p, 5 fig, 1 tab, 9 ref. ONR Contract Nonr 1575 (03), NR 388 002.

Descriptors: *Beach erosion, *Hurricanes, *Erosion, *Florida, Surges, Waves (Water), Currents (Water), Water levels, Storms, Damages, Floods, Geomorphology, Topography, Sands.
Identifiers: Ft. Walton (Fla), Hurricane Camille (1969).

Drastic erosion and swift recovery were the major characteristics of beach changes associated with Hurricane Camille at Fort Walton, Florida. Storm waves caused general erosion of the beach surface, and a scarp about 1 meter deep was produced about 40 meters behind the shoreline. After the hurricane, humps of sand in a train with regular spacing along the shore emerged in the surf zone bed. These were formed by longshore currents, which probably acted on large quantities of sand brought into the surf zone bed as a result of the preceding subaerial erosion. The humps subsequently moved shoreward and eventually climbed on the beach; a substantial part of the exposed beach volume was thus restored about a week after the hurricane. (Knapp-USGS)

EFFECTS OF HURRICANE CAMILLE ON THE LANDSCAPE OF THE BRETON-CHANDELEUR ISLAND CHAIN AND THE EASTERN PORTION OF THE LOWER MISSISSIPPI DELTA,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
L. D. Wright, F. J. Swaye, and J. M. Coleman.
Louisiana State University Coastal Studies Institute Bulletin No 4, p 13-34, Technical Report 76, February 1970. 22 p, 17 fig, 16 ref. ONR Contract Nonr 1575 (03), NR 388 002.

Descriptors: *Hurricanes, *Erosion, *Beach erosion, *Louisiana, *Surges, Waves (Water), Currents (Water), Water levels, Storms, Damages, Floods, Geomorphology, Vegetation effects.
Identifiers: Hurricane Camille (1969).

Air and ground reconnaissance immediately following the passage of Hurricane Camille disclosed significant modifications to the natural landscape of the Breton-Chandeleur Island arc and to the eastern portion of the lower Mississippi Delta. Considerable dissection and redeposition was evident along beach and barrier formations, and total obliteration dominated numerous sections. Trends of redistributed beach material strongly reflected the final direction of hurricane-induced mass transport of water. In the lower delta damage was mainly to marsh vegetation and was attributable to high water and surge currents directed almost entirely from north to south. (Knapp-USGS)

PATTERN FORMING FORCES IN DELTAS,
Asian Inst. of Tech., Bangkok (Thailand).
Catalino del Rosario dela Cruz.
M.Eng. Thesis No 275, Asian Institute of Technology, 1970. 80 p, 48 fig, 5 tab, 60 ref, 3 append.

Descriptors: *Deltas, *Geomorphology, *Sedimentation, Sediment transport, Sediment yield, Provenance, Ocean water, Ocean waves, Waves (Water), Currents (Water), Streamflow, Salinity, Rainfall, Runoff, Statistical methods, Regression analysis, Data collections.
Identifiers: Delta formation.

Patterns and the causative independent variables of delta formation include river, ocean, and climatic forces. The river variables include mean annual discharge, sediment yield and river slope to the sea. Ocean variables consist of continental shelf characteristics, including width, depth of edge, bed slope, sea and swell waves duration, swell direction, and salinity. Climatic elements are temperature and rainfall. Regression analysis was used in obtaining predictive equations for discharge and sediment yield as a function of catchment characteristics. From the chosen variables, the following showed best correlation: mean annual rainfall and area for the discharge; and percentage of mountainous area, relief, area, and perimeter for the sediment yield. A similar regression analysis was applied to determine the relative influence of delta producing variables. Among the selected delta features, the following gave good correlations with the independent variables: apex-to-sea length, area, maximum width, maximum width to number of mouth ratio, ratio of maximum width to total number of distributaries, topography and side topography. SOURCE AND DISPERSION OF SURFACE SEDIMENTS IN THE GULF OF MAINE--GEORGES BANK AREA,
Woods Hole Oceanographic Institution, Mass.
David A. Ross.
Supported by US Geological Survey, Washington, D.C. Journal of Sedimentary Petrology, Vol 40, No 3, p 906-920, September 1970. 15 p, 7 fig, 4 tab, 25 ref.

Descriptors: *Sedimentation, *Maine, *Continental shelf, *Bottom sediments, *Provenance, Sediment transport, Erosion, Glacial drift, Mineralogy, Sands, Tracking techniques, Sampling, Dispersion.
Identifiers: Gulf of Maine, Georges Bank.

A study of mineral composition of the sand fraction (2 to 0.062 mm) of 115 surface samples from the Gulf of Maine--Georges Bank area defined eight provinces based on heavy mineral composition. Sediments in three provinces, off the Penobscot, Kennebec, and Merrimack Rivers, are of recent origin. The remaining five provinces are composed of relict sediments of which three are of glacial origin. Sediments of Georges Bank are reworked from the Coastal Plain. Fine-grained sediments were winnowed from Georges Bank and transported into the Gulf of Maine where they are mixed with glacial sediments. Mineral composition

throughout the area of study is controlled mainly by the source. This modification is most pronounced in the high energy areas of Georges Bank and off Cape Cod, where more resistant heavy minerals predominate. The sediments in these areas are also better sorted and have lower feldspar--quartz ratios than the sediments in the low energy areas of the Gulf of Maine. (Knapp-USGS)

TURBID BOTTOM WATER ON THE CONTINENTAL SHELF OF THE NORTHERN BERING SEA,
Washington Univ., Seattle. Dept. of Oceanography.
Dean A. McManus, and C. Stephen Smyth.
Journal of Sedimentary Petrology, Vol 40, No 3, p 869-873, September 1970. 5 p, 3 fig, 9 ref. USGS Contract No 14-08-0001-10924.

Descriptors: *Sediment transport, *Continental shelf, *Alaska, Silts, Currents (Water), Turbidity, Mineralogy, Pertide size, Sampling, Sedimentation, Suspended load, Bed load, Bottom sediments.
Identifiers: *Bering Sea.

In July 1968, the bottom water on the continental shelf of the northern Bering Sea contained concentrations of suspended material in excess of 2 ppm. Near the Alaska mainland, concentrations were as much as fivefold greater. The material is 85 percent mineral grains and has a modal particle size of 20 microns. Because of the net northward movement of the water through Bering Strait into the Chukchi Sea, the bottom water with its high silt concentration appears to be an important transport mechanism for supplying modern silt to the shelf in the Chukchi Sea. (Knapp-USGS)
W71-00390

THE LATERIAL DISTRIBUTION OF CLAY MINERALS IN LAKES PONTCHARTRAIN AND MAUREPAS, LOUISIANA,
Louisiana State Univ., Baton Rouge. Dept. of Geology.
Robert A. Brooks, and Ray E. Ferrell, Jr.
Journal of Sedimentary Petrology, Vol 40, No 3, p 855-863, September 1970. 9 p, 10 fig, 2 tab, 18 ref. OWRR Project A-007-LA.

Descriptors: *Clay minerals, *Clays, *Brackish water, *Water chemistry, *Sedimentation, Louisiana, Lakes, Deposition (Sediments), Flocculation, Kaolinite, Montmorillonite, Illite, Salinity, Saline water systems.
Identifiers: Lake Pontchartrain (La), Lake Maurepas (La).

Lakes Pontchartrain and Maurepas, Louisiana, are large bodies of brackish water. Water chemistry influences the lateral distribution of clay minerals. The water level in the lake system fluctuates rapidly, and as a result, the salinity of any given area is quite variable over a given period of time. However, the trends of the ionic gradients are fairly constant. Clay minerals flocculate and settle in consistent patterns in response to these compositional gradients. Kaolinite flocculates and settles in areas of lowest salinity. Montmorillonite has its greatest concentration in the higher salinity portions of the lake and is the most resistant to settling. Illite also appears to be concentrated in the sediments of the higher salinity areas. The K:H and Na:H ratios in the more saline portions of the lake approach the ratios, which define the hydrochemical stability field of K-mica, and suggest that Illite may be formed as an alteration product of other clay material. THE RELATIONSHIP BETWEEN WATERSHED GEOLOGY AND BEACH RADIOACTIVITY,
California Univ., Berkeley. Hydraulic Engineering Lab.
John R. Byerly.
Available from NTIS as AD-420425, $3.00 in paper copy, $0.95 in microfiche. Technical Memorandum No. 135, August 1963. 32 p.
Identifiers: Hydrology, California, *Beaches, Radioactivity, *Gamma ray spectroscopy, Analysis, Minerals, Geochemistry, Igneous rock, Radiochemistry, Decay schemes, Thorium, Uranium, Decay schemes, Sedimentary rock, Watersheds, Santa Cruz (California).

A correlation between the watershed geology of the Ben Lomend Mountain area north of Santa Cruz, California, and the radioactivity of the beaches receiving sediment from the watershed has been attempted. The radioactivity of stream and littoral sediments have been presented in terms of concentration of thorium as determined by gamma-ray spectroscopy. The results have not shed any light on the watershed geology-beach radioactivity relationship as the area of study failed to produce a radiometric anomaly of sufficient magnitude to be reflected in the littoral sediment. The resluts do show considerable variation in the thorium content of the stream sediment but the variation is not consistent with any known geological variation.

SPECIFIC GRAVITY DETERMINATION OF MARINE SEDIMENTS,
Naval Postgraduate School, Monterey, Calif.
Joseph C. Henderson.
Available from NTIS as AD-706 731, $3.00 in paper copy, $0.95 in microfiche. MS Thesis, April 1970. 124 p.
Identifiers: *Ocean bottom, Density, *Specific gravity, Densimeters, Kaolinite, Montmorillonite, Colloids, Test methods, Quartz, Theses, Naval research.

Accurate specific gravity measurements are required for the analysis of physical properties of marine sediments. Application of the bottle pycnometer technique, the standard determination method, is time-consuming, tedious, and perhaps subject to inaccuracies in the case of fine particulate matter. A review of methods currently in use was conducted to ascertain the present state of the art and reveal any new developments in this field. Specific gravity values for three operating modes of the air comparison pycnometer, two of which use helium, were compared with bottle pycnometer values for four test materials. The air comparison pycnometer determinations, regardless of operating mode, resulted in higher specific gravities than their counterpart bottle pycnometer values for kaolinite, montmorillonite, and marine sediment samples. The use of helium as the comparison medium in the air comparison pycnometer appears to reduce the surface active characteristics of the colloidal material. Specific gravity determinations by all four test methods agreed very well for powdered quartz samples with a known specific gravity.

SEDIMENT-SEAWATER INTERACTION IN GLACIOMARINE SEDIEMENTS OF SOUTHEAST ALASKA,
Alaska Univ., College. Inst. of Marine Science.
Ghanshyam D. Sharma.
Geological Society of America Bulletin, Vol 81, No 4, p 1097-1105, April 1970. 9 p, 14 fig, 1 tab, 15 ref. AEC Grant No AT (04-3)-310; NSF Grant No GP 5115.

Descriptors: *Water chemistry, *Connate water, *Sediments, *Alaska, *Glacial drift, Sea water, Clay minerals, Chemical reactions, Geochemistry, Saline water systems, Ion exchange, Ion transport, Glaciers.
Identifiers: Glaciomarine sediments.

The chemical composition of interstitial waters and the mineralogy of recent glaciomarine sediments from southeast Alaska were determined to study the interaction between sediments and sea water. Differences in chemical composition of overlying and interstial waters of bottom sediments reflected the nature and extent of sediment-sea water interaction. Such interaction depends on bulk mineralogy and particle size of sediments, evironment of deposition, and path length the sediments follow prior to deposition. During transport and early stages of burial, cation exchange is the major process responsible for changes in the composition of interstitial water and sediments. Analyses of interstitial waters of cores indicated maximum variations with depth in sodium ion concentration, followed by calcium and magnesium ion concentrations. (Knapp-USGS)

EVIDENCE OF DIURNAL MINERAL VARIATIONS OF CERTAIN CHEMICAL FACTORS IN MOUNTAIN STREAMS AS INFLUENCED BY BENTHIC ORGANISMS (IN FRENCH),
Bernard Serra-Tosio.
Comptes Rendus Academie des Sciences, Paris, Vol 269, No 24, Serie D, p 2431-2434, 1969. 2 fig, 3 ref.

Descriptors: *Chemical properties, *Diurnal distribution, *Fluctuations, *Streams, Sampling, Phytoplankton, Aquatic organisms, Diatoms, Absorption, Biochemistry, Metabolism, Volumetric analysis.
Identifiers: *Mountain streams, Water chemical variations, Furon River (France), Bourne River (France), Hydrotitrometric degree.

Determination of total oxygen, pH, and contents of oxygen, silica, nitrates, phosphates, Sulfates, Total

alkalinity, and titration value in water of two mountain streams were performed at 4-hour intervals during June, July, and September. With the exception of sulfates, the results showed a diurnal variation of analysed factors, correlated with the time of water sampling and activity of phytobenthic and phytoplanktonic organisms. The supply of oxygen and most of mineral nutrients was depleted during the daytime hours, whereas the supply of phosphates was depleted during the nights. (Wilde-Wisconsin)

INFLUENCE OF ARSENIC OXIDE IONS ON THE ABSORPTION OF PHOSPHATE IONS BY CHLORELLA (IN FRENCH),
Centre Universitaire de Luminy, Marseille (France).
Robert Jeanjean, and Francis Blasco.
Comptes Rendus Academie des Sciences, Paris, Vol 270, No 15, Serie D, p 1897-1900, 1970. 5 fig, 9 ref.

Descriptors: *Algae, *Chlorella, *Absorption, *Phosphate, Inhibition, Kinetics, Phosphorus radioisotopes, Analytical techniques, Arsenic compounds.
Identifiers: *Arsenic oxide, Geiger counter, Michaelis-Menten method, Liquid scintillation.

The effect of arsenic oxide on absorption of labeled phosphorus by Chlorella was determined by measuring the radioactivity of cultured algae with a Geiger counter, or by liquid scintillation. The results showed that arsenic oxide, structurally analogous to phosphate, acts as a competitive inhibitor in the absorption of phosphorus, the inhibition being in principle a reversible process. The rate of absorption is a function of time and the concentration of both antagonists. (Wilde-Wisconsin)

Identifiers: *Lake Minnetonka (Minn), Asterionella, Anabaena, Morphometry, Cryptophyta, Peridiniales, Cryptomonadales, Desmidiales, Chlorococcales, Volvocales, Pennales, Centrales, Chroococcales, Hormogonales.

The relationships among phytoplankton population densities, light attenuation, and integral photosynthesis are used as basis for a model of the planktonic photosynthetic system. Total photosynthesis beneath a unit of water surface (integral photosynthesis) is estimated from the phytoplankton density and the photosynthetic rate at optimal illumination. Analysis of the phosphorus budget indicates that phosphorus is deposited in sediments soon after it enters the lake (Minnetonka). Net rate of phosphorus deposition is similar to rate of influx from the watershed. There is no relationship between phosphorus and photosynthesis during spring and autumn, when phosphorus concentrations are highest, but photosynthesis is closely related to concentrations of total phosphorus during summer when the dominant algae are species able to fix nitrogen. Phytoplankton never fully utilize phosphorus concentrations exceeding 100 milligrams/cubic meter, because population density and resultant shading, limits integral photosynthesis. Nuisance algal blooms can be quickly reduced by controlling phosphorus influx. The model suggests that integral photosynthesis increases linearly as chlorophyll concentrations increase to 16 milligrams/cubic meter and provides a basis for estimating primary productivity of large water bodies from remotely sensed chlorophyll concentrations and temperature measurements. CONDENSED PHOSPHATES IN LAKE WATER AND WASTE WATER,
Toronto Univ. (Ontario). Dept. of Civil Engineering; and McMaster Univ., Hamilton (Ontario). Dept. of Chemical Engineering.
G. W. Heinke, and J. D. Norman.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 2, 1970. Preprint. 6 p, 2 fig, 2 tab, 12 ref.

Descriptors: *Phosphates, *Lakes, *Waste water (Pollution), *Hydrolysis, Detergents, Great Lakes, Temperature, Hydrogen ion concentration, Activated sludge, Treatment, Eutrophication, Surfactants, Enzymes, Lake Ontario, Seasonal, Algae, Cultures, Microorganisms, Effluents, Settling basins, Waste water treatment, Laboratory tests.
Identifiers: *Condensed phosphates, Sodium tripolyphosphate, Sodium pyrophosphate.

Hydrolysis rate of sodium tripolyphosphate and sodium pyrophosphate in Great Lakes water and waste water under conditions of temperature, pH and concentration occurring in the environment are evaluated. Condensed phosphates from detergents are major phosphorus contributors to waste water--about double the human waste contribution in the United States and about equal to it in Canada. Condensed phosphates hydrolyze extensively during activated sludge treatment, with about 15% remaining in the effluent, hydrolyzing in waste water three times faster in summer than winter. Once discharged to surface waters, hydrolysis proceeds at a much slower rate, depending on the extent of microbial activity in the surface water. Studies on the effect of pH changes show fastest rates of hydrolysis occurring at the natural pH of waste water or lake water. Experimental data at low levels of concentration, below 15 milligrams/liter phosphates, are best fitted by a zero-order model. A graphical presentation allows an order of magnitude prediction of hydrolysis rate to be expected in a particular situation. Results of this work are of value in research on phosphorus removal methods and eutrophication studies. (Jones-Wisconsin)

Descriptors: *Weathering, *Humic acids, *Soil formation, Leaching, Mineralogy, Soil chemistry, Water chemistry, Ion transport, Ion exchange.
Identifiers: Chemical weathering.

Naturally occurring organic acids, commonly called 'humic acids,' are effective agents in the colloidal transport of copper, lead, zinc, iron, and alluminum. Concentrations of organic acids in the range of 4-40 ppm carbon in water can effect increases of several orders of magnitude in the amount of these metals 'stabilized' in solution. Stability of these metal-organic colloids increases with increasing organic acid concentration and increasing pH. The optimum condition for the stability, in general, lies between pH 6 and pH 9. Chemical weathering due to differential leaching of cations by organic acids may be largely responsible for the formation of sedimentary aluminum and lateritic deposits, which are restricted to tropical and subtropical regions where organic acids are abundant. (Knapp-USGS)

GEOLOGY, MINERAL DEPOSITS, AND GEOCHEMICAL AND RADIOMETRIC ANOMALIES, SERPENTINE HOT SPRINGS AREA, SEWARD PENINSULA, ALASKA,
Geological Survey, Washington, D.C.
C. L. Sainsbury, Travis Hudson, Reuben Kachadoorian, and Thomas Richards.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, D.C. Geological Survey Bulletin 1312-H, 1970. 19 p, 2 fig, 1 plate, 4 tab, 12 ref.

Descriptors: *Geochemistry, *Exploration, *Surveys, *Sampling, Data collections, Trace elements, Investigations, Placer mining, Sediments, Faults (Geology), Mineralogy.
Identifiers: Geochemical prospecting.

Geologic mapping, analyses of samples of bedrock, and geochemical studies have disclosed the probable source of placer gold and tin on Humboldt Creek, Serpentine-Kougarok area, Alaska, and have shown mineralized bedrock in several areas on the east side of the granite stock at Serpentine Hot Springs. Gold, silver, mercury, arsenic, cobalt, copper, molybdenum, nickel, lead, antimony, tin, tungsten, and zinc occur in panned stream concentrates and in altered bedrock that is associated with steep faults, thrust faults, and quartz veins. Two mineralized and altered fault zones were sampled in detail; one contains float fragments of highly argentiferous galena (as much as 5,000 parts per million Ag). Anomalous amounts of metal in bedrock samples, in stream sediments, and in panned concentrates from stream sediments and rock samples suggest areas of mineralized bedrock outside the granite; radiometric anomalies lie within the granite and near the contact of the granite but have not been evaluated on the ground. GEOTHERMAL WASTES AND THE WATER RESOURCES OF THE SALTON SEA AREA,
California State Dept. of Water Resources, Sacramento.
Sanford L. Werner, and Larry J. Olson.
Copies of report may be obtained from Office of Procurement, Documents Section, PO Box 20191, Sacramento, Calif. 95820--Price $3.50. California Department of Water Resources Bulletin No 143-7, February 1970. 123 p, 10 fig, 2 plate, 14 tab, 121 ref, 7 append.

Descriptors: *Water resources, *Surface waters, *Groundwater, *Geothermal studies, Waste storage, Water quality, Chemical analysis, Salinity, Trace elements, Radiochemical analysis, Hydrology, Climatic data, Streamflow, Irrigation, Geology, Recreation facilities.
Identifiers: Lake inflow, Imported water, Mud volcanoes.

Data and information derived from previous studies and from investigations in the field concerning water resources and geothermal wastes of the Salton Sea Area in California are evaluated. To date, the development of the geothermal resources in the Salton Sea Area has been centered in the Buttes thermal area, southeast of the Salton Sea, involving the drilling of 15 geothermal wells. Development of geothermal resources in the Salton Sea Area has been hindered considerably by the lack of available disposal sites for brine, bittern wastes, and accumulated salt deposits. Moreover, the highly saline brine has caused operational problems. Estimated heat content of the Salton Sea geothermal reservoir (Buttes thermal area) is a minimum of 2x10 to the 19th power calories. That estimate was based on an underlying geothermal reservoir which was assumed to be equivalent to a cylinder 7 km in diameter, 3 km in thickness, having an average temperature of 250 deg C, and an average volumetric specific heat of 0.7 cal/cu cm. The Salton Sea is the largest body of water in California. The total value of physical investments related to the Sea is in the order of $900 million. The Sea's salinity is about 36,000 ppm--slightly more saline than the oceans--and it is increasing; and this increase could be accelerated by the discharge of the still saltier geothermal wastes. Maps, pictures, and tables of data are included. (Woodard-USGS)

SOME ASPECTS OF THE DISTRIBUTION, CHEMISTRY, AND MINERALOGY OF SUSPENDED MATTER IN THE GULF OF MAINE,
Woods Hole Oceanographic Institution, Mass. Dept. of Chemistry.
Derek W. Spencer, and Peter L. Sachs.
Marine Geology, Vol 9, No 2, p 117-136, September 1970. 20 p, 8 fig, 7 tab, 22 ref, append.

Descriptors: *Water chemistry, *Clay minerals, *Solutes, *Suspended load, *Sea water, Mineralogy, Geochemistry, Sampling, Water analysis, Clays, Particle size, Chemical analysis.
Identifiers: Gulf of Maine.

Suspended matter in the Gulf of Maine decreases from the surface to about 50 m and then increases exponentially as the bottom is approached. From 50 m down, the suspended matter is dominantly layer silicates which are interpreted as resuspended bottom material. In the upper 50 m particulate phosphorus, copper, and zinc occur principally in organism. There is, however, little evidence that significant amounts of these elements are reaching the bottom in an organic particulate form, and most appear to be regenerated in the water column. The distributions of particulate Al and Fe are controlled largely by the suspended silicates, and there is no evidence that a free ferric hydroxide phase is important. (Knapp-USGS)

THE NUTRIENT CYCLES OF AN ECOSYSTEM,
Forest Service (USDA), Laconia, N.H. Hubbard Brook Experimental Forest.
F. Herbert Bormann, and Gene E. Likens.
Scientific American, Vol 223, No 4, p 92-101, October 1970. 10 p, 10 fig.

Descriptors: *Nutrients, *Hydrologic budget, *Small watersheds, *Forests, *Cycling nutrients, Ecology, Leaching, Forest management, Clearcutting, Water yield, Energy budget, Food chains, Water chemistry.
Identifiers: Nutrient budget, Nutrient cycle, Forested watersheds, Hubbard Brook Experimental Watershed.

Both hydrologic and nutrient budgets were determined in undisturbed and in devegetated watersheds at Hubbard Brook Experimental Watershed, New Hampshire. The forest has been undisturbed by cutting or fire since 1919. Average annual precipitation is 123 centimeters and runoff is 72 centimeters, with evapotranspiration averaging 51 centimeters. Most of the runoff (57%) occurs during the snowmelt period of March, April and May. The concentrations of potassium, calcium and magnesium hardly change with runoff volume, and the concentration of sodium decreases by only 3 times as the discharge rate increases by 4 orders of magnitude. All these relations show how strongly stream-water chemistry is under the control of processes inherent in the forest ecosystem. The total output of elements is strongly dependent on the volume of stream flow. Deforestation had a pronounced effect on runoff. Treatment also resulted in a fundamental alteration of the nitrogen cycle, which in turn caused extraordinary losses of soil fertility. The capacity of the ecosystem to retain nutrients is dependent on the maintenance of nutrient cycling within the system. When the cycle is broken, as by the destruction of vegetation, the loss of nutrients is greatly accelerated. (Knapp-USGS)

PORE FLUIDS OF RECENT MARINE SEDIMENTS: 1. OXIDIZING SEDIMENTS OF 20 DEGREES N, CONTINENTAL RISE TO MID-ATLANTIC RIDGE,
University of Southern California, Los Angeles. Dept. of Geological Sciences.
James L. Bischoff, and Teh-Lung Ku.
Journal of Sedimentary Petrology, Vol 40, No 3, p 960-972, September 1970. 13 p, 2 fig, 3 tab, 56 ref.
NSF Grant GA 1419.

Descriptors: *Water chemistry, *Connate water, *Atlantic Ocean, *Ion exchange, *Clay minerals, Sea water, Membrane processes, Mass transfer, Thermal water, Mineralogy, Chemical reactions, Sampling, Bottom sediments, Sedimentation.
Identifiers: Mid-Atlantic Ridge.

Pore fluids were extracted on shipboard from 12 deep-sea sediment cores taken during an east to west traverse from Africa to the Mid-Atlantic Ridge, between latitudes 18 deg N and 20 deg N. They were analyzed for Cl, SO4, Mg, Ca, K, Sr, SiO2, B, Li, and Mn. Excepting Cl, SO4, and Ca, which are very close to sea water composition, other components examined are slightly but systematically different from normal sea water. Con-

stancy of Cl in samples of varying clay: $CaCO_3$ ratios negate semipermeable membrane behavior of compacting clays, at least for the top 10 meters of sediment. K and B enrichments mirrored by Mg depletions suggest authigenic chlorite formation at the expense of illite K-feldspar and perhaps montmorillonite. The rather constant SiO_2 level and its enrichment over that of bottom water appear indicative of control by clay-silica equilibria. Minor variations of all elements along depths of cores become magnified and more erratic in the Ridge area, due to heterogeneity of mineralogy or perhaps local hydrothermal effects. (Knapp-USGS)

CHEMICAL CHANGES IN INTERSTITIAL WATERS FROM SEDIMENTS OF LAGOONAL, DELTAIC, RIVER, ESTUARINE, AND SALT WATER MARSH AND COVE ENVIRONMENTS,
Rensselaer Polytechnic Inst., Troy, N.Y. Dept. of Geology; and Hebrew Univ., Jerusalem (Israel). Dept. of Geology.
Gerald M. Friedman, and Eliezer Gavish.
Journal of Sedimentary Petrology, Vol 40, No 3, p 930-953, September 1970. 24 p, 43 fig, 2 tab.

Descriptors: *Water chemistry, *Connate water, *Bottom sediments, *Estuaries, Marshes, Lagoons, Brackish water, Saline water systems, Sedimentation, Ion exchange, Clay minerals, Hydrogen ion concentration, Oxidation-reduction potential.
Identifiers: Long Island (NY), Great South Bay (NY).

The chemical characteristics of interstitial waters of sediments of lagoonal, deltaic, river, estuarine, and salt water marsh and cove environments were studied. The chemical characteristics of surface, bottom, and interstitial waters were compared at each core station; in many cores, changes within the sediment profile were also measured. The pH and Eh were measured in surface and bottom waters and at intervals along the core. Values of pH and Eh are lower in interstitial waters than in the overlying waters. In lagoonal and river delta cores, and at the mouth of the river estuary, the chlorinity is higher in interstitial waters. In the river estuary, the chlorinity in the interstitial waters is lower. Biological processes are responsible for the decreases in pH and Eh. Increase in the Ca/Cl ratio and decreases in the ratio of cations to Cl depend on the interaction between clay minerals and water, particularly on cation exchange. (Knapp-USGS)

UNSTEADY FLOW IN CHANNEL OF VARIABLE CROSS SECTION,
University of Strathclyde, Glasgow (Scotland).
John Ellis.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY 10, Paper 7583, p 1927-1945, October 1970. 19 p, 12 fig, 2 tab, 13 ref, append.

Descriptors: *Estuaries, *Currents (Water), *Unsteady flow, *Tidal effects, *Mathematical models, Computer programs, Model studies, Hydraulics, Inlets (Waterways), Open channel flow, Tides.
Identifiers: Irregular channels.

Characteristic equations describing one-dimensional unsteady open-channel flow in an irregular channel are developed. The integration of these characteristic equations is presented and methods of approximation for the evaluation of the integrals involved in these characteristic equations are considered. The most promising of these numerical integration techniques are incorporated in computer procedures which are linked to form a complete program. This program is used in the modelling of the tidal motion in an inlet of the sea. The particular inlet chosen was one which contained large changes of cross-sectional shape along its length. The varying geometrical properties of the inlet, along its length, are included in the analysis by the preparation of tables of section properties with water level for a series of cross sections. This information is read into the computer at the start of computations. Comparisons are made between computed water levels and actual field records. (Knapp-USGS)
W71-00023

EVIDENCE OF SEAWATER ENRICHMENT BY INFLUX OF SUSPENDED MINERALS FROM FRESH WATER. EXAMPLE THE RHONE (IN FRENCH),
Centre Universitaire de Luminy, Marseille (France). Laboratoire d'Hydrobiologie Marine.
Francois Blanc, Herve Chamley, and Michel Leveau.
Comptes Rendus Academie des Sciences, Paris, Vol 269, No 25, Serie D, p 2509-2512, 1969. 1 fig, 7 ref.

Descriptors: *Saline water-freshwater interfaces, Nutrients, Sea water, Rivers, Seston, Saline water, Illite, Chlorides, Calcium, Watersheds, Quartz, Analytical techniques, X-ray analysis, Precipitation (Atmospheric), Erosion.
Identifiers: Rhone River (France), Minerals, Feldspar.

The progression of the surface water of the River Rhone into the sea was established on the basis of the presence of seston and mineral constituents and a comparison of water salinity. The enrichment of sea water in solids and the decrease in concentration of salts reflected meteorologic conditions and the resulting degree of perturbation of the surrounding uplands. (Wilde-Wisconsin)

THE BENTHIC COMMUNITIES OF LOOSE SUBSTRATA OF THE CONTINENTAL PLATEAU IN THE VICINITY OF THE BANYULS-SUR-MER (IN FRENCH),
Alain Guille.
Comptes Rendus Academie des Sciences, Paris, Vol 270, No 6, Serie D, p 189-192, 1970. 1 fig, 1 tab, 9 ref.

Descriptors: *Benthic fauna, *Biological communities, *Distribution patterns, Sands, Gravels, Biomass.
Identifiers: Spisula, Branchiostoma, Amphiura, Nephthys, Venus, Nucula, Scoloplos, Auchenoplax, Catalonian shores (France), Substrate, Subirrigated sands, Infralittoral floors, Circalittoral floors.

The dense network of dredging stations on the Catalonia shore of France led to rediscovery of the biocoenotic relationships of the benthic fauna. The boundaries of the three principal communities are delineated by the nature of the deposits: Spisula subtruncata with multitude of mollusks, confined to fine sands, Branchiostoma lanceolatum of coarse sands and fine gravel, and Amphiura filiformis occupying near-littoral floors. These major associations exhibit a number of subcommunities and still smaller divisions, called facies. Estimates for each community include their area in square kilometers, number of species and specimens per square meter, and biomass in gram/square meter. The obtained results are comparable to some other marine sites such as that of La Manche. As suggested, the general notion about poverty of the Mediterranean benthos must be revised with respect to certain sections. (Wilde-Wisconsin)

C. R. Goodwin, E. W. Emmett, and Bard Glenne.
Oregon State University Engineering Experiment Station Bulletin No 45, May 1970. 39 p, 17 fig, 5 tab, 21 ref, append. NSF Grant GH-45.

Descriptors: *Estuaries, *Oregon, *Currents (Water), *Tides, Water circulation, Data collections, Hydrologic data, Stratification, Streamflow, Water quality, Water resources development, Water management (Applied), Water levels, Stream gages, Tidal effects.
Identifiers: Yaquina estuary (Oregon), Alsea estuary (Oregon), Siletz estuary (Oregon).

The results of tidal measurements in the Yaquina, Alsea, and Siletz estuaries, Oregon are presented. Investigations of the tidal mechanisms in these estuaries show amplifications of the entrance tidal range throughout the Yaquina estuary. In the Alsea and Siletz estuaries a marked choking of the tidal range takes place through the entrance. In the Alsea the choking continues past Waldport before amplification of the tidal range occurs. A phase difference of 90-100 degrees is found to exist between tidal elevations and tidal currents in the three estuaries. This as well as amplification in the tidal range indicate the presence of reflected waves or resonance conditions. (Knapp-USGS)

EXTENT OF BRACKISH WATER IN THE TIDAL RIVERS OF MARYLAND,
Geological Survey, Towson,Md.
W. E. Webb, and S. G. Heidel.
Maryland Geological Survey Report of Investigations, No 13, 1970. 46 p, 18 fig, 12 tab, 32 ref, append.

Descriptors: *Saline water intrusion, *Estuaries, *Maryland, Tidal effects, Streamflow, Channel morphology, Water quality, Saline water, Salinity.
Identifiers: *Tidal rivers, *Extent of brackish water, Salt-water front.

Fresh-water discharge, tide height and estuary size, shape, and salinity at the mouth are important controls on the extent of brackish water in tidal rivers (estuaries) of Maryland. Long-term predictions of the frequency or times at which brackish water will

penetrate to a given section of an estuary are difficult because of the complex relations between the controls and the lack of quantitative predictions of the controls. Graphs and maps in the report show the historic extent of brackish water and may be used to estimate the probable extent of brackish water in the principal estuaries. For a distance of about 15 miles most of the estuaries will be brackish during one season, but will contain fresh water in the same section during another season of the year. In an estuary section containing a salt front, the water may be fresh at low tide but brackish at high tide. Extremes usually occur twice in 24 hours. The estuaries tributary to Cheaspeake Bay usually contain relatively fresh water for 10 to 30 miles downstream from the point where tidal effect ceases. Data show that brackish water is flushed downstream by a sudden increase in discharge for a length of channel which will accomodate the volume discharged. (Woodard-USGS)

EFFECTS OF HURRICANES CAMILLE AND LAURIE ON THE BARATARIA BAY ESTUARY,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
Rodney Adams.
Louisiana State University Coastal Studies Institute Bulletin No 4, p 47-52, February 1970. 6 p, 5 fig. ONR Contract Nonr 1575 (03), NR 388 002.

Descriptors: *Beach erosion, *Hurricanes, *Surges, *Louisiana, *Estuaries, Waves (Water), Currents (Water), Water levels, Water level fluctuations, Floods, Damages, Geomorphology, Topography, Beaches, Deltas, Lakes.

The two late-season hurricanes, Camille and Laurie, passed to the east and south of the Barataria Bay estuary but did produce above-normal tides and accumulations of wind-driven debris. Maximum winds with Camille reached 45 to 65 miles per hour at Grand Isle and were from the east and north when the most severe effects were felt. Laurie shifted to an easterly course when she was still 175 miles south of Grand Isle, and no severe winds were experienced. Rapid water-level rise was accompanied by high winds from the east and northeast, which drove vast quantities of marsh grass debris against buildings and embankments. There were no significant changes to the shoreline from Southwest Pass to the mouth of Bayou Lafourche. However, aerial photographs taken immediately after the storm show what appears to be small washover fans to the east of Grand Isle on Grand Terre and Shell Island. (Knapp-USGS)

AN ECOLOGICAL SURVEY OF A SANDY BEACH,
Naval Postgraduate School, Monterey, Calif.
Thomas Joseph Berger.
Available from NTIS as AD-709 087, $3.00 in paper copy, $0.95 in microfiche. MS Thesis, April 1970. 42 p.
Identifiers: *Beaches, *Ecology, Environment, Sand, Grain size, Invertebrates, Tides, Annelida, Arthropods, Crustacea, Thesis, Nephtys caecoides, Nephtys californiensis, Archaeomysis maculata.

An ecological survey of a sandy beach was made to determine relationships between population densities and sand grain size distributions, season and height above the tidal datum plane (MLLW). Fifteen species of invertebrates in four phyla were collected. Four zones relative to tidal datum and two major habitats - protected outer coast sandy beach and outer coast sandy beach - were defined. Nephtys californiensis and Archaeomysis maculata showed distinctive distribution patterns relative to mean grain size which require further investigation.

THE EFFECTS OF VELOCITY ON THE PASSIVATION OF ALLOYS IN BRACKISH WATER,
Denver Research Inst., Colo.
Donald F. Klodt.
Denver University, Denver Research Institute Final Report to Office of Saline Water, October 1968. 32 p, 16 fig, 3 tab, 3 ref. OSW Contract No 14-01-0001-1335.

Descriptors: *Corrosion, *Desalination plants, *Inhibition, *Design criteria, *Corrosion control, Chemical properties, Chemical reactions, Chlorides, Damages, Structural design, Evaluation, Laboratory tests, Desalination apparatus.
Identifiers: Desalination equipment materials.

Laboratory corrosion tests were conducted on 8 alloys in both aerated and deaerated brackish water. The alloys were all commercially available alloys normally used as materials of construction in desalination plants and were tested in the welded and non-welded condition. Flow velocities of 6 to 8 ft/sec were generally used, although some tests were conducted with the flow velocity being 12 to 16 ft/sec. The maximum test temperature was 125

deg C. Corrosion rates were determined from weight loss data after a minimum exposure period of 350 hours. Anodic polarization curves were determined for the alloys under static and velocity conditions and over a range of temperatures from 25 deg C to 75 deg C in brackish water using potentiostatic techniques. The effects of velocity of flow and/or temperature on the passivity of the alloys were determined. Correlations between the various alloys and between the potentiostatic data and velocity corrosion data were made where possible. The titanium alloy (2.5Sn-5.0A1) demonstrated the best corrosion resistance and could be passivated anodically under both static and velocity conditions for temperatures below 45 deg C. (Knapp-USGS)
W71-00064

SEEDING OF BRACKISH WATER IN A SPRAY FILM EVAPORATOR,
Army Mobility Equipment Research and Development Center, Fort Belvoir, Va.
John E. Jones, Jr.
Available from NTIS as AD-706 225, $3.00 in paper copy, $0.95 in microfiche. Report 1972, January 1970. 35 p.
Identifiers: *Desalination, *Corrosion inhibitation, *Sulfates, *Corrosion, Chemical precipitation, Evaporators, Calcium compounds, Sprays, *Brackish water, *Scale (Corrosion), Calcium sulfate.

When operating on many brackish waters, sea water distillation equipment becomes inoperative in a short time because of heavy deposits of calcium sulfate scale. Investigations are being made to evaluate a calcium sulfate crystal-seeding method for prevention of this scale formation in evaporators. The report covers tests performed at the Office of Saline Water, Roswell Test Facility to investigate the use of crystal-seeding techniques to inhibit the formation of sulfate scale in a horizontal-tube, spray-film evaporator. These crystal-seeding techniques were evaluated on a raw well water and well water with silica removed. A control test without crystal seeding was also conducted. The results of these tests indicate that on all waters tested, the crystal-seeding process can inhibit the formation of evaporator scale in a horizontal-tube, spray-film evaporator.

RESEARCH ON IMPROVED REVERSE OSMOSIS MEMBRANES,
Gulf General Atomic, Inc., San Diego, Calif.
H. K. Lonsdale, R. L. Riley, C. E. Milstead, L. D. La Grange, and A. S. Douglas.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Price $1.25. Office of Saline Water Research and Development Progress Report No. 577, October 1970. 143 p, 46 tab, 28 fig, 62 ref. OSW Contract 14-01-0001-1778.

Descriptors: *Permselective membranes, *Membranes, *Osmosis reverse, *Desalination, Ion transport semipermeable membranes, Demineralization brackish water, Sea water, Demineralization, Diffusion, Osmosis.
Identifiers: *Composite membranes, Ultrathin films.

The principal objective was the development of a new concept in the preparation of reverse osmosis membranes. These membranes consisted of a very thin desalinating film suitably supported by a finely porous substrate. Much of the development was based on thin films of cellulose acetate with a high degree of substitution and a porous substrate consisting of mixed cellulose nitrate and cellulose acetate. The development has proceeded to the point where seawater desalinating membranes can be prepared and it is believed that the technique can be readily scaled up. At 1500 psi and with 3.5% NaCl brine, water fluxes of 10 gal./ft sq-day and salt rejections of 99.5% were achieved. Several other approaches in preparing new desalinating membranes were studied. These included interpolymer membranes from polyvinylpyrrolidone and several polyisocynates; polyelectrolyte membranes prepared by dip coating or casting a film of polyacrylic acid on a finely porous support membrane; and a micromosaic membrane for desalination by piezodialysis. The most promising was the polyacrylic acid membrance which could be useful for brackish water desalination. The properties of cellulose acetate membranes were explored in greater detail. The rejection of a number of inorganic and organic compounds and several salt mixtures were examined using the cellulose acetate membranes. (Kindley-Office of Saline Water)

MULTIPLE PHASE EJECTOR PILOT PLANT,
Kaye (Joseph) and Co., Inc., Cambridge, Mass.
John Leigh.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Price $2.25. Office of Saline Water Research and Development Progress Report 578. June 1970. 64 p, 30 fig, 8 ref. OSW Contract 14-01-0001-2105.

Descriptors: Desalination, *Distillation, *Evaporators, Jets, *Pilot plants.
Identifiers: *Multiple phase ejector, Steam-jet ejector, *Steam generator, Water-jet ejector, Vertical tube evaporator.

A pilot plant was designed, constructed, tested and turned over to an operating contractor at the Office of Saline Water, Wrightsville Beach Test Facility, Wrightsville Beach, North Carolina. The pilot plant utilizes a Multiple Phase Ejector having an availability efficiency of 30 percent with driving-stream inlet state at 500 deg F and 10 percent vapor quality, a horizontal spray film evaporator, and an oil-fired steam generator. This plant produces approximately 5000 pounds per hour of distillate and provides 2000 pounds per hour of dry saturated steam at 265 deg F to run a neighboring five-effect VTE pilot plant. The VTE pilot plant is capable of producing approximately an additional 10,000 pounds per hour of distillate. The combined plant demonstrates the ability of the MPE plant to reduce the net heat requirement per pound of distillate produced in the VTE plant, alone, from about 200 BTU to approximately 150 BTU in the combined plant. (Robinson-Office of Saline Water)

3B. Water Yield Improvement

NEW DEVELOPMENTS IN ATMOSPHERIC WATER RESOURCES,
Bureau of Reclamation, Denver, Colo. Office of Atmospheric Water Resources.
Archie M. Kahan, and Richard L. Eddy.
In: Advances in Hydroscience, Vol 6, New York, N.Y., Academic Press, p 1-41, 1970. 41 p, 8 fig, 1 tab, 37 ref.

Descriptors: *Cloud seeding, *Water yield improvement, *Reviews, Weather modification, Clouds, Nucleation, Statistical methods, Chemistry of precipitation, Meteorology, Rain, Water supply, On-site tests, Water management (Applied), Water resources development.
Identifiers: Atmospheric water management.

Cloud seeding for precipitation management is reviewed with emphasis on recent work in the United States. The present status in the field can be described as extremely encouraging when attention is given to single cloud experiments or limited area seeding in winter storms. A number of cloud-seeding techniques have been developed. Ground-based seeding, using silver iodide generators, is the most commonly used technique, especially for winter storms in mountainous terrain. Airborne seeding, using silver iodide or crushed dry ice, is frequently employed with summer convective storms. Careful attention must be given to matching the techniques (or tools) needed to form a balanced system to accomplish the job. A true precipitation management system should have: (1) a component to analyze the present and expected water needs and water sources, plus the anticipated effects of precipitation management; (2) a component to recognize weather in which precipitation management would result in the desired effect (or undesirable effects); (3) a component to select the proper treatment material and delivery system; and (4) a component to assess the results. The projects briefly reviewed include statistically designed studies in the United States and abroad, and long-term commercial projects. (Knapp-USGS)

GEOBOTANIC APPROACH FOR IMPROVEMENT OF RANGE RESOURCES IN DESERT AND SEMI-DESERT AREAS OF KAZAKHSTAN, USSR,
Central Arid Zone Research Inst., Jodhpur (India).
A. K. Chakravarty.
Paper based on lectures given by Soviet Specialists in a seminar at Alma-Ata, Kazakhstan, USSR, April-May, 1966. Author sponsored by FAO. Annals of Arid Zone, Vol 8, No 2, p 251-256, September 1969. 1 fig, 1 tab, 5 ref.

Descriptors: *Mapping, *Arid lands, *Pasture management, *Water distribution (Applied), *Productivity, Semiarid climates, Animals, Vegetation, Grasses, Water conservation, Deserts, Dry seasons, Moisture deficity, Range management, Seasonal.
Identifiers: *USSR, *Kazakhstan Republic, *Animal husbandry.

The Kazakh Republic possesses vast natural pasture lands, most of which are in desert and semi-desert zones. Almost all agriculture involves animal husbandry based on the fodder production of the natural pastures. However, annual climatic fluctuations lead to seasonal water deficits, thereby limiting productivity. Therefore, extensive studies were undertaken to devise increased production methods. Vegetational maps were constructed and surveys undertaken of soils, relief, vegetational associations, grass productivity, haymowing, land usage, range conditions, irrigation and cultivation. Plant nutritive values were determined and animal management practices were reviewed. The ultimate goals--at least in part accomplished--were to establish an ecological balance between animals and long term pasture usage on the basis of higher quality pastures and better seasonal water catchment methods. Surface and groundwater utilization are described. Exploitation of groundwater for increasing dry season production is important. (Casey-Arizona)

ROLE OF INFILTRATION GALLERIES IN AUGMENTING SUPPLIES TO THE PUMPING WELLS IN THE DESERTS,
H. S. Nagabhushanaiah.
Annals of Arid Zone, Vol 8, No 2, p 287-290, September 1969. 5 fig.

Descriptors: *Arid lands, *Shallow wells, *Hydrogeology, *Filters, *Groundwater basins, Artesian wells, Aquifers, Pervious soils, Infiltration, Permeability, Deserts, Wells.
Identifiers: *Infiltration galleries.

When large amounts of water for irrigation are drawn from shallow wells, overdraft may be avoided by the use of infiltration galleries, which are horizontal wells surrounded by graded filters. Groundwater is collected along their lengths and carried to the pumping well. Infiltration galleries are widely used around the world, but are restricted to shallow wells because of filter maintenance and location problems at greater depths. They are, therefore, rarely used in arid regions where groundwater levels are deep. There are, however, 2 exceptional hydrogeological situations where the use of infiltration galleries are feasible in the desert: (1) isolated shallow groundwater basins resulting in an artesian supply from a confined aquifer to an overlying unconfined aquifer and (2) shallow water tables due to backwater storage when an impermeable soil intercepts permeable soils. Factors in the design of appropriate infiltration galleries are discussed. Seepage flow for a given set of boundary conditions may be determined by the flow net method. (Casey-Arizona)

Descriptors: *Water conservation, *Water transfer, *Crop production, *Rainfall, *Agriculture, Soil properties, Climatology, Topography, Economic efficiency, Arid lands, Semiarid climates, Planning, Irrigation, Moisture deficit, Specialty crops, Marketing, Sewage effluents, Saline water, Drainage systems.
Identifiers: *Israel, *Mediterranean agriculture.

Israel is a small, overpopulated country with marginal agricultural resources which has applied enormous scientific and technological methods in developing a crop agriculture. The emphasis on increased productivity has taken place within basically Mediterranean agricultural patterns--hardy perennials, winter grown annuals and irrigated specialties. A review of the physical environment reveals climatic patterns which cause an overall national water deficit and generally marginal edaphic and topographic conditions. The northern areas have a relatively favorable water economy, and irrigation and drainage projects within those locales are described. A national plan of water transfer from favored to more arid regions is in operation and is controlled by the Federal Government. When completed, a 120 mile interregional complex of water diversion structures will exist. Water is considered a state property and its use is carefully regulated. Additionally, major water conservation schemes are under development. Two of the most important concern saline water irrigation systems and utilization of sewage effluents. Efficient modern Israeli marketing schemes in western Europe for specialty crops are described. (Casey-Arizona)

RESPONSE OF AGRICULTURAL CROPS TO FLOODING, DEPTH-OF-WATER TABLE AND SOIL GASEOUS COMPOSITION,
North Carolina State Univ., Raleigh. Dept. of Soil Science.
R. E. Williamson, and George J. Kritz.
American Society Agricultural Engineers Transactions, Vol 13, No 2, p 216-220, March-April 1970. 5 p, 1 fig, 3 tab, 49 ref.

Descriptors: *Crops, *Agriculture, *Saturated soils, *Soil gases, Water table, Plants, Root develolpment, Aeration.

Agricultural crops vary genetically and physiologically and thus require different soil water regimes for optimum production. To specify an optimum water-table depth, it is necessary to know at least the crop species, soil characteristics and watering procedure. Generally, grasses tolerate high water tables very well during cool seasons when the plants are dormant. Some crops such as strawberries are adversely affected by large fluctuations in the yearly water table (high in winter, low in summer). When a water table rises above some of the root system during a growing season and remains at a higher than normal level for more than one or two days, severe root pruning results. Experiments relating root function and plant performance to duration and extent of root system inundation should provide useful information for drainage design. Laboratory work has shown the root and shoot response of several plant species to various root zone gaseous compositions under varying conditions of temperature and radiant energy. Both in field and laboratory studies, relative to the problem of excess water and crop production, the air and water regime in relation to root function and total plant performance throughout its production cycle is the basic consideration. To restrict attention to the problem of excess water removal from a land area or to the specification of optimum water-table depths tends to abscure the real dimensions of the problem. Tables and curves relating data of the study are included. (Woodard-USGS)

DRAINAGE PROBLEMS AND THE PROPOSED SOLUTION FOR A LARGE IRRIGATED AREA IN THE SAN JOAQUIN VALLEY OF CALIFORNIA (USA),
Westlands Water District, Fresno, Calif.
William R. Johnston.
7th Congress on Irrigation Drainage, Quest 26, Rep Disc, R1-R33, p 26.247-26.262, Mexico City, 1969. 16 p, 4 fig, 2 tab, 8 ref.

Descriptors: Irrigation, *Drainage, *Drainage costs, *Irrigated land, Drainage districts, Drainage engineering, Agriculture, Drainage systems, Perched water table, Saline water, Saline soils, *Waterlogged land, Costs, Design, Farms, Effluents, Groundwater.
Identifiers: San Joaquin Valley (Calif), San Luis Drain (Calif), *Irrigated agriculture, *Westlands Wtr Dist (Calif).

Under an irrigated agriculture regime, drainage problems develop slowly over many years before high groundwater or excess salinity affects the economy of an area. This is particularly true in an area where the irrigation program is accomplished with a limited water supply on slowly permeable soils and where drainage is impossible because of the absence of a suitable outlet. The 240,000-ha Westlands Water District, located in the semiarid San Joaquin Valley of California, is unique in that even prior to the time an annual delivery of 1,200,000 acre-ft of imported water was applied to the land, it was one of the most intensively cultivated irrigated agricultural areas in the world. The area has been irrigated for 25 to 30 yr, using a limited underground water supply pumped from depths of 120 to 240 m. Only a minimal water supply has been used in the area, but a perched water table has developed over approximately one-sixth of the District land, causing severe drainage problems and high salinity conditions in the crop root zone. The problem of agricultural drainage in this area is complex, but is being solved through local, state, and Federal cooperation. (USBR)
W71-00267

THE RELATIONSHIP AMONG THE FEDERAL GOVERNMENT DISTRICT BOARDS, MANAGERS AND WATER USERS ON NEW IRRIGATION AND DRAINAGE PROJECTS,
Bureau of Reclamation, Denver, Colo.
James M. Ingles.
7th Congress on Irrigation Drainage, Quest 26, Rep Disc, R1-R33, p 26.207-26.220, Mexico City, 1969. 14 p, 7 ref.

Descriptors: Irrigation, *Irrigation districts, *Water users, Costs, Federal Government, Irrigation operation and maintenance, Administration, Management, *Drainage districts, Decision making, State governments, Organizations, Training, Personnel, Associations, Planning.
Identifiers: Operating criteria.

An understanding of the functional relationship among project beneficiaries (water users) and various state and national organizations having direct or indirect responsibilities contributes significantly to the ultimate success of irrigation and drainage projects. The primary functional relationships that have evolved in the past century in the U S in organizing and managing new irrigation projects are discussed. The state is the subnational level of government that usually establishes legislative authority for water users' organizations and regulatory powers related thereto, especially in use of water. The National Government is the highest political institution of a country, and usually establishes policies and participates in land and water resource programs in the national interest. Water users' organizations consist of 3 groups: (1) the board of directors--the elected governing body; (2) the operating staff--usually a hired manager and employees; and (3) the individual water users--landowners and operators. Transition from operation of a project by the National Government to the ultimate objectives of self-operation by water users' organizations and the obligations and responsibilities involved are discussed. 04. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control of Water on the Surface

UNSTEADY SEEPAGE TOWARD NARROW DITCH,
Washington Univ., Seattle. Dept. of Civil Engineering.
Bruce W. Hunt.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY 10, Paper 7586, p 1953-1963, October 1970. 11 p, 5 fig, 1 tab, 4 ref, append.

Descriptors: *Ditches, *Seepage, *Unsteady flow, *Groundwater movement, Water levels, Aquifers, Water table, Drainage, Recharge, Drains, Surface-groundwater relationships.
Identifiers: Unsteady seepage.

A linearized solution is obtained for the unsteady, free surface seepage toward a ditch in an infinitely deep aquifer. The complex potential is defined to be the solution of a first order, linear, partial differential equation, and examination of the general solution for this equation reveals that a seepage surface cannot be imposed along the ditch boundary in the linearized model. A numerical example is treated, and it is pointed out that the same results can be used to describe the unsteady recharge of an aquifer under similar boundary conditions. (Knapp-USGS)

FREQUENCY OF DESIGN DROUGHT,
Colorado State Univ., Fort Collins. Natural Resources Center.
E. S. Joseph.
Water Resources Research, Vol 6, No 4, p 1199-1201, August 1970. 3 p, 1 fig, 2 tab, 3 ref.

Descriptors: *Droughts, *Planning, *Frequency analysis, *Design, *Water supply, Reliability, Reservoir design, Reservoir operation, Runoff forecasting, Water yield.
Identifiers: Design drought.

Certain problems associated with a drought frequency analysis were studied and their solutions are proposed. The techniques are based on a probabilistic framework. Return period of a project's design drought (the annual drought for which a water resource project such as a treatment plant or a low flow augmentation system has to be designed) is treated as a function of the project's useful life and the desired level of assurance. Assurance is the probability of nonoccurrence of droughts equal to or smaller than the design drought during the project's useful life. A method is given for estimating the probability and return period associated with the design drought of a project. A chart gives recurrence intervals of design droughts for various combinations of the estimated useful life of a project and the desired level of assurance. (Knapp-USGS)

WATERSHED RESEARCH IN WESTERN NORTH CAROLINA - A STUDY OF THE EFFECTS OF AGRICULTURAL COVERS UPON THE HYDROLOGY OF SMALL WATERSHEDS.
Tennessee Valley Authority, Knoxville, and North Carolina State Univ., Raleigh.

Tennessee Valley Authority and North Carolina State Univ Cooperative Report - Project Authorization No 445.1 Final Report published by Tennessee Valley Authority, June 1970. 115 p, 29 fig, 5 plate, 14 tab, 3 append.

Descriptors: *Rainfall-runoff relationships, *Small watersheds, *North Carolina, Hydrology, Evapotranspiration, Soil conservation, Water conservation, Tennessee Valley Authority project, Overland flow, Runoff, Lysimeters, Gaging stations.
Identifiers: Experimental watersheds.

The hydrology of 6 small watersheds in Western North Carolina was studied from 1949 to 1970 to obtain information on the effects of agricultural covers on runoff. As watershed size diminishes, the effects of differences in soils become more pronounced and hydrometeorological variations over relatively small distances may become significant. Significant differences were found in the stormflow response attributable to the agricultural covers. On areas with deep permeable topsoils, the hydrologic differences among well-managed covers were minor, whereas with relatively impermeable topsoils, the cover and its management were found to have a much larger impact upon stormflow response. Runoff is contributed in an inverse relation to the capacity to (1) infiltrate and store rainfall and (2) store or transmit interflow. In farm planning, cover management should be related to the depth of the A horizon. In areas of thin or impermeable A horizon, and downslope from these areas, the best conservation covers, such as pasture, should be grown. In urban planning, provisions should be made for preserving sites with deep permeable soils as moisture storage zones. Typically, the alluvium along stream bottoms meets these criteria, and these areas should be preserved as 'green belts.' Paving or roofing of areas with fairly impermeable topsoils will not significantly change streamflow characteristics. (Knapp-USGS)

SOME PROBLEMS OF STREAMFLOW FORECASTS BASED ON INFORMATION THEORY,
Research Inst. for Water Resources Development, Budapest (Hungary).
K. Body, G. Erdos, and K. Szesztay.
The Use of Analog and Digital Computers in Hydrology, Vol I, p 280-288, 1968. 9 p, 7 fig.

Descriptors: *Digital computers, *Streamflow forecasting, *Gaging stations, *Time, Equations.
Identifiers: *Danube River.

Digital computer systems of gauge-relations were determined in order to forecast discharges of the

Danube River at the Iron-Gate section using data from 17 stations for roundly 2000 days for 5 and 10 day periods. Regularities of the streamflow regime of the river were described by relations between the discharges of selected gauging stations. Comparison of indices characterizing the closeness of gauge-relations derived on the basis of changes of discharges corresponding to different time intervals were applied for the determinination of travel times even under conditions of backwater effect. Special forecast equations were established for each day on the basis of data most characteristic for the streamflow regime conditions of the given day. (See also W71-00071) (Kriss-Cornell)
W71-00078

APPLICATION OF STREAMFLOW SYNTHESIS AND RESERVOIR REGULATION - 'SSARR' PROGRAM TO THE LOWER MEKONG RIVER,
D. M. Rockwood.
The Use of Analog and Digital Computers in Hydrology, Vol I, p 329-344, 1968. 16 p, 4 fig, 6 ref.

Descriptors: *Digital computers, *Hydrology, *Synthesis, *Streamflow, *Reservoir operation.
Identifiers: Mekong River.

The general concepts of the streamflow synthesis and reservoir regulation-'SSARR'-program, togehter with highlights of its application to the Mekong River Hydrologic and Reservoir Regulation analyses were presented. Digital computer utilization and a discussion of areas of application to hydrologic engineering were given. The original version of the 'SSARR' program was developed in 1957. The computer program described in this paper was a 'third generation' program for streamflow synthesis. It was designed as a hydrologic and reservoir regulation model with application to a much wider range of conditions than the previous version and it greatly expanded logic for simulating hydrologic processes, channel routing techniques and reservoir regulation methods. The program provided a framework for future studies of hydrologic analyses of the Mekong River. (See also W71-00071) (Kriss-Cornell)

ALTERNATIVE DIGITAL COMPUTER APPLICATIONS TO EVALUATE LINKED WATER RESOURCES,
Water Research Association, Medmenham (England).
M. J. Burley, and J. A. Cole.
The Use of Analog and Digital Computers in Hydrology, Vol II, p 584-590, 1968. 7 p, 4 fig, 1 tab, 11 ref.

Descriptors: *Optimization, *Digital computers, *Dynamic programming, *Reservoirs, *Desalination plants, Surface waters, Costs, Risks.
Identifiers: Linked water resources.

The subject of linked water resources was viewed from two main aspects: (1) the computational problem of operating two linked storages optimally, for any given hydrology, given capacities, and fixed economic parameters of operation; and (2) the conjunctive use of a desalination plant and a surface water impoundment, at a given deficit risk. Month by month control rules were formulated by digital computer. Example (1) used a dynamic programming approach based on inflow probabilities, and catered for 64 possible combinations of reservoir contents and proceding inflows. Example (2) used a search of 34 years of inflows to find a 'worst case' basis for deciding at what reservoir contents the desalination plant should start to operate. By adopting the control rule it was shown that the linked system reduced operating costs by 30 to 50% below those of a year round supply by desalination. (See also W71-00071) (Kriss-Cornell)

Descriptors: *Floods, *Flood damage, *California, *Flood plains, Flood control, Non-structural alternatives, Maximum probable flood, Historic flood.
Identifiers: Santa Barbara County (Cal), Standard project flood, Intermediate regional flood.

Flooding of the Santa Ynez River, Santa Barbara County, California is described in a report of flood plain problems based on records of rainfall, runoff, and historical and present flood heights. Maps, photographs, profiles, and cross sections indicate the extent of flooding that has occurred and which may be expected to occur in the future. The information is for use in study and planning ways to minimize vulnerability to flood damages by control of flood plain use zoning and subdivision regulations, the construction of flood protection works, or by combinations of these approaches. THE WATERSHED IN PRINCIPLE,
Syracuse Univ., N.Y.
Peter E. Black.
Water Resources Bulletin, Vol 6, No 2, p 153-162.

Descriptors: *Watersheds (Basins), *Watershed management, *Planning, On-site data collections, Water control, Evaluation, Decision making.
Identifiers: *Fundamental concepts, Electrical analogy.

Three fundamental concepts linking drainage basin characteristics, stream behavior, and management of watersheds are deduced from field data and observations. An electrical analogy of a watershed clarifies definitions and broadens understanding of this complex natural resource. The three basic principles deal with: (1) The interrelationships of watershed morphology, constitution, and appearance; (2) the nature of the control man can exert over runoff-influencing forces, and (3) the efficiency of watershed management efforts. Recognition of these principles can assist educators, managers, planners and researchers to more fully inform students and to more effectively guide and evaluate management decisions. Water Resources Bulletin, Vol 6, No 3, p 375-385, May-June 1970. 5 fig, 7 ref.

Descriptors: *Computer models, *Mathematical models, *Rainfall-runoff relationship, River basins, Simulated rainfall, Water management (Applied), Flood control.

Computer simulation of river basin hydrology has progressed from an interesting academic exercise to a practical engineering procedure of increasing utility. Mathematical models of the many interrelated processes which occur in a basin have been developed along with efficient numerical procedures for their solution. This paper is concerned with a particular model which has been used to describe the transformation of a temporarily and spatially varying rainfall into a time history of stage and discharge on a flood plain. Although developed as a model of the physical processes involved, it is envisioned that the model can serve as one component of an information system for flood plain planning and management. The model consists of three elements: (1) a rainfall simulation which generates stochastic inputs to the model according to specified rainfall statistics, (2) a catchment-runoff model which converts the rainfall to surface runoff, (3) a flood stage model which converts the surface runoff to time histories of flood stage and discharge. The model has been used to investigate the effect of various structural for each of these. Of particular interest in development of the model have been recurring and partially unanswered questions relative to the proper balance among availability of data for use in the model, data requirements of the model and the objectives of the outputs produced by the model. JOINT PROBABILITY METHOD OF TIDE FREQUENCY ANALYSIS APPLIED TO ATLANTIC CITY AND LONG BEACH ISLAND, N. J.,
Weather Bureau, Silver Spring, Md.
Vance A. Myers.
Environmental Science Services Administration Technical Memorandum WBTM HYDRO 11, April 1970. 109 p, 41 fig, 20 tab, 20 ref.

Descriptors: *Tides, *Surges, *Hurricanes, *Statistical models, *Probability, Frequency analysis, Tidal energy, Flood forecasting, New Jersey, Storms, Waves (Water), Wave pile-up, Wind tides.
Identifiers: Joint probability, Tide frequency.

This paper describes the frequency analysis of combined storm surges and periodic tides prepared by ESSA as part of the Long Beach Island (New Jersey) study. These frequencies apply to the ocean beach. The Long Beach Island study is a pilot study in a new area. It is intended to serve as a guide to other studies of other coastal communities as well as to provide needed criteria at this one location. The frequency curve is extended beyond observed storm data by including hypothetical tides calculated from hypothetical storms chosen so as to represent future possibilities. Recent advances in the technique of computing surges from hurricane wind fields by solving simplified forms of the applicable dynamic equations make it possible to determine surges in a statistical manner for several hundred hypothetical hurricanes, representing different combinations of climatological hurricane characteristics. In calculating hypothetical tides, storm surges are combined with the astronomical tide in a random manner rather than being made coincident with astronomical high tide only. This joint probability approach is described in detail. (Knapp-USGS)

AN ANNUAL REPORT OF THE CHEMICAL CONTROL OF ALLIGATORWEED,
University of Sourthwestern Louisiana, Lafayette. Dept. of Chemical Engineering.
F. W. zur Burg, J. A. Foret, S. L. Solymosy, W. K. Averitt, and J. R. Barry.
Southwestern Louisiana University - Department of the Army, Corps of Engineers Cooperative Investigation, June 30, 1970. 231 p, 15 chart, 24 tab, 3 ref. Corps of Engineers Contract DACW-68-C-0006.

Descriptors: *Aquatic weed control, *Alligatorweed, *Herbicides, *Aquatic weeds, Weed control, Vegetation regrowth, Defoliants, Plant growth regulators.
Identifiers: (2,4-D).

When alligatorweed is treated with the chlorinated phenoxy type herbicides, the above-water portions of the plant are destroyed and regrowth takes place from one or more nodes beneath the water. Therefore, work was directed toward some method that would act on the secondary growth. Herbicides were applied to water in a pellet form to allow extremely slow release. Attempts were also made to disperse droplets of an oil soluble form of 2, 4-D into the water and then to add coagulating agents which would collect some droplets of 2, 4-D on the nodes and other underwater parts. No single commercial herbicide was found satisfactory. Phenoxy herbicides are most useful when applied to the roots of the plant. Application of 2, 4-D plus Silvex plus molasses gave the best results, a 90% kill below water. Some new chemicals, notably Ethrel, gave fair results. A virus disease which weakened plants should be studied as a possible control method. (Knapp-USGS)

FLOOD CONTROL AND DRAINAGE IN INDIA,
Central Water and Power Commission, New Delhi, (India).
P. N. Kumra.
Water Resources Journal, United Nations Economic Commission for Asia and the Far East (ST/ECAFE/SER. C/83), p 27-38, December 1969. 12 p.

Descriptors: *Floods, *Flood control, *Non-structural alternatives, Warning systems, Flood plain zoning, Reservoirs, Floodways, Channel improvement, Cost-benefit analysis.
Identifiers: *India.

Though floods in India are as old as the rivers themselves, the floods of the last decade and, more recently, of October 1968, have given rise to serious concern. With the development activities and increase in population in the country, there has been continued encroachment on the flood plains of the rivers with the result that the floods of the same intensity cause more damage now than before. The States affected by recurring floods are Andhra Pradesh, Assam, Bihar, Haryana, Jammu and Kashmir, Orissa, Punjab, Uttar Pradesh and West Bengal. The flood-protection methods in use can be broadly classified as (1) administrative and (2) engineering. Aministrative methods consist of flood forecasting and warning, and flood-plain zoning. One category of works aims at reducing the magnitude of the flood flows at the damage center, thereby reducing the spill and consequent damage. In the other category, the intensity of floods is not reduced but an attempt is made to reduce the damage by confining the flood flows and preventing spilling. Such works include embankments and channel improvements. (Knapp-USGS)

BURIED ASPHALT MEMBRANE CANAL LINING,
Bureau of Reclamation, Denver, Colo. Office of Chief Engineer.
Fred H. Geier, and William R. Morrison.
Available from NTIS as PB-193 143, $3.00 in paper copy, $0.95 in microfiche. Research Report No. 12, 1968, 58 p.
Identifiers: *Inland waterways, Bituminous coatings, *Asphalt, Bituminous coatings, *Bituminous coatings, Aging (Materials), Test methods, Moistureproofing, *Canal linings.

Analysis of test results and visual observations on membrane samples after 14 years' service did not reveal any serious deficiencies in the asphalt membrane lining. Of the 112 field samples evaluated from 20 different canal installations, more than 80 percent demonstrated satisfactory resistance to field aging. The membranes in poor condition resulted from accelerated aging primarily due to defective construction practice. Test results indicated that thickness is one of the more important factors contributing to life of the asphalt membrane. For a majority of the membranes evaluated, the change in physical properties due to field aging did not materially affect their ability to provide a flexible, watertight lining. Tests indicated that the greatest portion of this change occurs during the first 6 years of service. After this period, the rate of change is slower. An aging index was calculated through a computer program to determine the relative change in the physical properties of the membrane. This study reaffirms the point that adequate seepage control will be maintained for many years if the membrane is installed in accordance with current specifications.

SURFACE STORM WATER RUNOFF AND DRAINAGE STUDY FOR ESSEX COUNTY, NEW JERSEY.
Essex County Planning Board, Belleville, N.J.

Available from NTIS as PB-192 358, $3.00 in paper copy, $0.95 in microfiche. December 1969. 55 p.
Identifiers: *Management planning, New Jersey, *Economics, *Storms, Drainage, Design, Soils, Terrain, Surfaces, Geology, Construction, Structures, Statistical data, Tables, Urban areas, *Essex County (New Jersey), *Regional planning, Area planning, Development, *Storm sewers, *Surface water runoff, Watersheds.

The report analyzes storm frequency information and provides a study design prototype applicable county-wide for small watershed developments. Physical characteristics and surface imperviousness studies were made relating criteria of physical properties of soils, geology, topography (slope) and future land use to storm runoff expectations consistent with County and municipal comprehensive planning programs. Recommendations were made for future programs and measure required to better plan for future storm drainage facilities in Essex County.

STORM DRAINAGE IN THE TOLEDO REGIONAL AREA.
Toledo Regional Area Plan for Action, Ohio.

Available from NTIS as PB-191 387, $3.00 in paper copy, $0.95 in microfiche. Regional Report 9.3. Office of the Lucas County Engineer, September 1969. 118 p.
Identifiers: *Drainage, Urban planning, *Ohio, Drainage, Terrain, Inventory, Floods, Sanitary engineering, Standards, Problem solving, Budgets, Combined sewers, *Storm sewers, *Toledo (Ohio).

The report is an inventory and analysis of existing storm drainage systems. The collected information provides a basis for solving immediate drainage problems, guiding new development to those areas amenable to good drainage, and planning for future drainage improvements. Subject areas covered by the study include: planning and financing of storm drainage facilities; general standards for storm drainage systems; mapping of watershed areas; computation of storm water runoff and water surface elevations. Two important problem areas examined are flooding and combined sewers.

BESLER V GREENWOOD (INJUNCTION TO PREVENT OBSTRUCTING NATURAL FLOW OF DRAINAGE WATER).

212 NW 120-121 (Iowa 1927).

Descriptors: *Iowa, *Obstruction to flow, *Damages, *Tile drains, Watercourses (Legal), Alteration of flow, Riparian rights, Riparian land, Riparian waters, Relative rights, Drains, Tiles, Ditches, Bank erosion, Outlets, Overflow, Drainage water, Judicial decisions, Legal aspects, Surface waters, Surface runoff, Natural flow.

Plaintiff and defendant owned adjacent lands. Plaintiff sought an injunction against defendant's placing of obstructions in a natural drainage ditch which drained plaintiff's and defendant's property. Plaintiff also sought damages caused by water which backed up on his property allegedly due to such obstructions. The court stated that plaintiff had a right to drain his land in the general course of the natural drainage by constructing a covered drain discharging the water at the point the water would naturally flow into a natural water course. Plaintiff was entitled to an injunction restraining defendant from obstructing the flow of water in the ditch. However, plaintiff's claim to damages was not sustained since no evidence appeared showing whether the backup was due to defendant's obstructions or to a sack found in plaintiff's tile drain, both of which would have been sufficient to effectuate the overflow. The trial court's judgment for defendant was affirmed in part and reversed in part. (Price-Florida)

ELECTRIC ANALOG MODEL EVALUATION OF A WATER-SALVAGE PLAN, SAN LUIS VALLEY, SOUTH-CENTRAL COLORADO,
Geological Survey, Denver, Colo.
Philip A. Emery.
Colorado Water Conservation Board Groundwater Series Circular No 14, 1970. 11 p, 4 fig, 3 plate, 1 tab, 7 ref.

Descriptors: *Analog models, *Water management (Applied), *Groundwater basins, *Evapotranspiration control, *Withdrawal, Groundwater, Water levels, Water level fluctuations.
Identifiers: San Luis Valley (Colo).

An electric analog model was constructed as part of a water-resources appraisal study of the San Luis Valley in south-central Colorado. The model is used to synthesize the hydrology of the valley and to predict the effects of changes in water management. The plan called for salvaging water being consumed by nonbeneficial vegetation in the central part of the valley by pumping a network of wells. This part of the valley is internally drained. The model was used to predict the effects of pumping annually about 84,000 acre-feet of water from 129 wells for a 50-year period. The predicted decline in groundwater levels ranged from 1 to 100 feet. The major part of the water pumped is groundwater that would have been lost to evapotranspiration (84%) and the remainder is from groundwater storage (14%) and the Rio Grande (2%). (Knapp-USGS)

CALIFORNIA'S DIGITAL COMPUTER APPROACH TO GROUNDWATER BASIN MANAGEMENT STUDIES,
California Dept. of Water Resources; and TRW Systems Group, Redondo Beach, Calif.
E. M. Weber, H. J. Peters, and M. L. Frankel.
Use of Analog and Digital Computers in Hydrology, Vol I, p 215-223, 1968. 9 p, 4 fig.

Descriptors: *Computer programs, *Digital computers, *Groundwater basins, *Optimization, *cost, *Mathematical models, Management.

A computerized approach to the planning studies of integrated management of groundwater basin supplies, storage and transmission, conjunctively with surface water supplies, storage and transmission, developed since 1959, was described. A two spaced-dimensional diffusion mathematical model of the groundwater basin was developed which incorporated the nonlinear features of transmissibility variation with saturated thickness, rising and repercolating waters, and transmissibility variation (constrictions) at depth. Mathematical models of pipeline networks were developed to simulate the hydraulic characteristics of the expanding system and maximum delivery capacities were estimated. Selection of the digital approach was related to data availability, the sensitivity of the economic analysis to the scale of the physical model, and the application of digital computers in the economic analysis phase of the studies. Digital model validation was speeded by on-line hydrograph plots. A cost equation was developed to determine the most economical combination of pumping and surface storage facilities. The studies described and the models discussed have been used in studies of many geographical locations. (See also W71-00071) (Kriss-Cornell)

OPTIMIZATION OF CONJUNCTIVE USE OF WATER IN A STREAM-AQUIFER SYSTEM, USING LINEAR PROGRAMMING,
Geological Survey, Denver, Colo.
O. James Taylor.
Chapter C for sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402--Price $3.25. In: Geological Survey Research 1970, Chapter C: Geological Survey Professional Paper 700-C, p C218-C221, 1970. 4 p, 2 fig, 5 tab, 3 ref.

Descriptors: *Conjunctive use, *Surface waters, *Aquifers, *Surface-groundwater relationships, *Optimization, Computer programs, Linear programming, Water demand, Irrigation water, Water resources development, Water management (Applied), Colorado.
Identifiers: Arkansas River (Colo).

A linear program was used to show how conjunctive use of groundwater and surface water in a stream-aquifer system can be manipulated to minimize depletion of the stream. The program was designed to achieve the objective by satisfying the demand for irrigation water, using groundwater and surface water selectively during a 2-month period. If the irrigation system of a river basin can be reduced to a series of linear equations of tolerable errors, a great deal of insight is provided by the solution and sensitivity analysis of a linear program. The results of the program are highly dependent on the specified constraints which should be based on field measurements. (Knapp-USGS)

Department of Water and Power, Los Angeles, Calif.
Dennis E. Williams.
Groundwater, Vol 8, No 5, p 25-29, September-October 1970. 5 p, 5 fig, 5 ref.

Descriptors: *Artificial recharge, *Water management (Applied), *Groundwater movement, *Faults (Geology), Water storage, Alluvium, Aquifers, Water spreading.
Identifiers: Owens Valley (Calif).

Recent investigations of the faults in California's Owens Valley reveal that they are semipervious, or leaky in nature. The rate of groundwater movement through a semipervious alluvial fault is dependent upon the hydraulic conductivity of the fault gouge, the thickness of this zone, and the water-level differential across the fault. Optimization of the groundwater resources in the Owens Valley is currently practiced using these faults in a controlled recharge-extraction-salvage system. In a system of this type, artificial recharge is induced into the Valley's aquifers upgradient from alluvial fault zones. Salvage of groundwater is accomplished by lowering the water table in the vicinity of these faults. (Knapp-USGS)
W71-00196

DETERMINING THE SUSTAINED YIELDS OF WELLS IN CARBONATE AND FRACTURED AQUIFERS,
Pennsylvania State Univ., University Park. Mineral Conservation Section.
Richard R. Parizek, and Shamsul H. Siddiqui.
Groundwater, Vol 8, No 5, p 12-20, September-October 1970. 9 p, 7 fig, 2 tab, 11 ref.

Descriptors: *Water yield, *Aquifers, *Karst, Limestones, Fractures (Geology), Transmissivity, Drawdown, Groundwater movement, Hydrogeology, Theis equation, Water levels.
Identifiers: Well testing, Aquifer evaluation.

Carbonate aquifers with highly developed anisotropic permeabilities and other fractured rocks under water-table or semiwater-table conditions present complex hydrologic settings in which to predict the sustained yield of individual wells or groups of wells. Yields of wells in these settings are particularly responsive to the position of the water level and its relationship to one or more producing zones. Often total well capacity may be accounted for by a few openings separated by essentially nonproductive rock. A permeability profile must be defined for these wells. Permeability profiles may be roughly estimated from detailed driller's logs and caliper logs, and more precisely determined from flow meter surveys, packer tests and by pumping wells after successive increments of drilling or by a combination of increasing casing lengths and extended drilling. Test holes may be drilled immediately adjacent to the potential production well to define the inclination of individual conduits or wells test pumped when possible at rates sufficient to draw the pumping level to the top of the opening in question. DYNAMIC PROGRAMMING FOR OPTIMUM CONJUNCTIVE USE,
Nevada Univ., Reno. Desert Research Inst.
Gilbert F. Cochran, and William S. Butcher.
Water Resources Bulletin, Vol 6, No 3, p 311-322, May-June 1970. 6 fig, 1 tab, 12 ref.

Descriptors: *Water management, *Dynamic programming, *Conjunctive use, *Water utilization, *Water distribution (Applied), Water costs, Economics, Legal aspects, Water Law.
Identifiers: Las Vegas (Nevada).

This study was designed to determine how best the Las Vegas Valley Water District might intergrate the use of the existing groundwater and anticipated imported surface water. The consequences of certain provisions in the Nevada Water Law were examined to determine their effects on the groundwater system and costs of water. A dynamic programming technique was utilized. The problem as formulated consists of a single decision variable, single state variable dynamic programming algorithm evaluated over a fifty-year planning horizon at monthly intervals. In all solutions operating rules regarding groundwater pumping distribution and use of surface-water system are kept constant. The problem is considered deterministic in all respects. Optimization of conjunctive use of the water district is based on the objective function of minimizing water production costs. Results of the study are presented as a series of policy traces under each of the three alternatives considered. These traces describe the groundwater basin response under optimal operating conditions, given an estimate as to the present worth of groundwater pumping rights, and prescribe monthly water-procurement schedules for the operation of the water district. It is concluded that by using dynamic programming techniques it is possible to examine some economic and physical effects of groundwater conservation measures on a relatively complex system over a long period of time; and provides an optimal operating guide to system utilization for a given set of physical, legal, and economic parameters. (Marriott-Chicago)

COMPUTATION OF RATE AND VOLUME OF STREAM DEPLETION BY WELLS,
Geological Survey, Washington, D.C.
C. T. Jenkins.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC 20402--Price $0.30. Geological Survey Techniques of Water-Resources Investigations, Book 4, Chapter D1, 1970. 17 p, 5 fig, 3 tab, 13 ref.

Descriptors: *Surface-groundwater relationships, *Conjunctive use, Groundwater movement, Induced infiltration, Water management (Applied), Water table, Water wells, Water yield, Water levels, Equations, Streamflow.
Identifiers: Stream depletion by wells.

The depletion in flow of a nearby stream caused by pumping a well can be calculated by using dimensionless curves and tables. Computations can be made of (1) the rate of stream depletion at any time during the pumping period or the following nonpumping period (2) the volume of water induced from the stream duing any period, pumping or nonpumping, and (3) the effects, both in rate and volume of stream depletion, of any selected pattern of intermittent pumping. Sample computations illustrate the use of the curves and tables. An example shows that intermittent pumping may have a pattern of stream depletion not greatly different from a pattern for steady pumping of an equal volume. The residual effects of pumping, that is, effects after pumping stops, on streamflow may often be greater than the effects during the pumping period. Adequate advance planning that includes consideration of residual effects thus is essential to effective management of a stream-aquifer system. (Knapp-USGS)

INFLUENCE OF LAND USE ON RUNOFF FROM AGRICULTURAL WATERSHEDS,
Ohio State Univ., Columbus.
V. T. Ricca, P. W. Simmons, J. L. McGuinness, and Paul E. Taiganides.
American Society Agricultural Engineers Transactions, Vol 13, No 2, p 187-190, March-April 1970. 4 p, 3 fig, 5 tab, 6 ref. OWRR Project B-005-Ohio.

Descriptors: *Watershed management, *Land use, *Runoff, *Agriculture, Streamflow, Rainfall, Reforestation, Groundwater, Water table, Percolation, Hydrology, Hydrologic data.
Identifiers: North Appalachian Experimental Watershed (Ohio).

Thirty years of runoff data from agricultural watersheds at the North Appalachian Experimental Watershed were analyzed to determine the effects of land use on streamflow. Reforestation and improved cropping reduced annual and seasonal streamflow. High flows were reduced in both seasons, but the treatment effects on low flows were not consistent. A decrease in percolation potential was indicated by the declining trend of the November 1 groundwater level. The time trend of flow changed from strongly negative in the first 10 years to insignificant in the last 10 years of record, indication that the major effects of land use and treatment on streamflow have been reached. Hydrologically, the treated watersheds have stabilized in their new flow regimes. (Woodard-USGS)

SOME OBSERVATION OF STREAMFLOW AND WATER QUALITY IN THE URBAN ENVIRONMENT,
Geological Survey, Washington, D.C. Water Resources Div.
Andrew M. Spieker.
In: Proceedings of the Fourth American Water Resources Conference (American Water Resources Association, Urbana, Illinois, 1968) ed. Phillip Cohen, Martha N. Francisco, p 742-753. 10 fig, 3 ref.

Descriptors: *Streamflow, *Water quality, *Urbanization, Low-flow augmentation, Dissolved oxygen, Biochemical oxygen demand, Dissolved solids, Coliforms, Sewage effluents, Sludge disposal, Storm runoff, Groundwater.
Identifiers: *Salt Creek basin, Water quality parameters, Metropolitan Sanitary District of Greater Chicago, Combined sewage systems.

The effects of urbanization on the hydrologic regimen are studied through observation of the Salt Creek basin in Illinois from 1940 to 1965. Although most studies of urban hydrology have been concerned with the effects of urbanization on low flows may be significant. Flow-duration curves from two gaging sites show differences between four subsidiary periods between 1951 and 1965. Changes in sewage disposal practices, such as affiliation with Metropolitan Sanitary District of Greater Chicago, may reduce flow almost completely during day periods. On the other hand, where a community operates its own treatment plant, increased population bring about increased sewage effluent discharge. Variations in water quality with streamflow are indicated using four parameters: dissolved oxygen (DO), biochemical oxygen demand (BOD), coliform bacteria, and total dissolved solids. Other parameters which have been ignored but which are necessary to give a complete picture of water quality are listed. Nevertheless, DO and BOD readings at several locations during flooding conditions and low flow conditions show favorable DO readings during the flooding period. Exceptions are explained as resulting from untreated discharge from combined sewer systems. Regarding dissolved solids, concentration is much higher at low flow. Coliform bacterial counts were higher during high flows with combined sewers, accumulated sludge in the streambed, and storm runoff as important contributors. Discussion is given to augmenting low flows and to clearing and cleaning accumulated sludge deposits from stream bottoms. (Preckwinkle-Chicago)

SEDIMENT PROBLEMS IN URBAN AREAS,
Geological Survey, Washington, D.C.
Harold P. Guy.
Available free on application to the U.S. Geological Survey, Washington, D.C. 20242. Geological Survey Circular 601-E, 1970. 8 p, 6 fig, 1 tab, 22 ref.

Descriptors: *Urbanization, *Sedimentation, *Soil erosion, *Stream erosion, Sediment load, Sediment transport, Damages, Water law, Floods, Flood damages, Cities, Water pollution sources.
Identifiers: Urban sediment sources.

Soil erosion and sediment deposition in urban areas are as much an environmental blight as badly paved and littered streets, dilapidated buildings, billboard clutter, inept land use, and air, water, and noise pollution. In addition, sediment has many direct and indirect effects on streams that may be either part of or very remote from the urban environment. Sediment, for example, is widely recognized as a pollutant of streams and other water bodies. Much of the disturbed soil in urban construction areas erodes and becomes sediment in streams; the sediment damages water-control works and aquatic habitat, degrades water quality, increases flood damages, and lowers the environmental attractiveness. During the process of stabilization of an area after construction, streams tend to erode their beds and banks as a result of increased runoff. Documentation of erosion sources and amounts, of sediment concentration in runoff, of stream-channel changes, and of the location and amounts of deposition together with an economic analysis of sediment damages and a pertinent research program provides the knowledge needed to find the best solutions to a wide variety of existing and future urban sediment problems. dentifiers: Channel scarps.

reconnaissance of the present gully system and alley surfaces of small drainage basins in western orth Dakota indicates that channel-scarp formaon may most often be the result of one of three eneral conditions. These conditions are: (1) cutoff the downvalley toe of alluvial fill in tributaries by ncroachment of a migrating main channel; (2) utting on a local reach of steeper gradient as a esult of (a) an extreme flood, (b) a shift toward reater precipitation causing channel degradation n the steeper reach, or (c) short time-separation etween two storms; and (3) piping collapse. vailable from NTIS as PB-195 084, $3.00 in aper copy, $0.95 in microfiche. Completion Reort, Missouri Water Resources Research Center, ug 27, 1970. 10 p, 101 tab, 2 fig, 7 ref, 2 append. WRR Project A-028-MO (2).

escriptors: Erosion, Seepage, Slope protection, Erosion control, Road banks, *Filters, Gravels, orous media.
dentifiers: *Gravel layer, Particle migration.

laboratory study was conducted to evaluate the asibility of using a random graded single layer of ravel as a protective filter against embankment rosion due to seepage. This evaluation was based n the observation of movement of particles from a ne sand layer into filters with considerable variaon in gradation. Also varied were the quantity and rection of flow. Forty one tests gave over six hunred individual penetration depths. These tests indicated that an increased thickness of filter layer an be used to replace fineness of gradation. Correlation between penetration depths for all gradaons was obtained using an approximated average ydraulic radius for each filter. Te data on penetraon patterns and relationships between penetration epth and average hydraulic radius should be helpul in the design of a random graded single layer rotective filter.

QUALITY AND SEASONAL FLUCTUATION OF HEADWATER STREAMS IN MONTANA,
Montana Forest and Conservation Experiment Station, Missoula.
George F. Weisel, and Robert L. Newell.
Available from NTIS as PB-194 756, $3.00 in paper copy, $0.95 in microfiche. Bulletin 38, Montana Forest and Conservation Experiment Station, School of Forestry, University of Montana, Missoula, Montana, Aug. 1970. 16 p, 6 tab, 8 fig, 18 ref. OWRR Project No. A-018-MONT (2).

Descriptors: *Water quality, *Pollutant Identification, *Turbidity, Dissolved solids, Hardness (Water), Alkalinity.

The water quality of 25 headwater creeks and the Blackfoot River, all tributaries to the Clark Fork of the Columbia, was investigated. Most of the qualities analyzed exhibit definite seasonal trends. Turbidity, total residue, and percent of residue from settleable solids are the most variable, particularly in watersheds which have been roaded and logged. The pH values are generally 7.4--8.6. The water is most basic during summer months and becomes less so during snow and rain runoff. The only acid stream was one which receives seepage from old mine tailings. The levels of total hardness, calcium hardness, and alkalinity decreases with increased runoff. Total dissolved solids, calcium, magnesium, bicarbonates, and chlorides are at highest levels during low water. They are derived mostly from water percolated through surface runoff. In general, the spring fed streams and streams used for irrigation contain the greatest amounts of dissolved materials. The streams maintain a high level of dissolved oxygen seldom less than 8 mg/l. Photosynthesis and nocturnal respiration are unimportant in effecting the amount of dissolved oxygen in these mountain streams. Carbon dioxide is present in amounts less than 2 mg/l.

PHOTOMETRIC METHOD FOR ESTIMATION OF MINUTE AMOUNTS OF MERCURY,
Eastman Kodak Co., Rochester, N.Y.
Albert E. Ballard, and C. D. W. Thornton.
Industrial and Engineering Chemistry, Vol 13, No 12, p 893-897, December 15, 1941. 5 p, 7 fig, 1 tab, 7 ref.

Descriptors: *Laboratory tests, *Chemical analysis, *Water analysis, *Trace elements, Pollutant identification, Poisons, Photometry.
Identifiers: Mercury, Mercury analysis.

Mercury resonance radiation of wave length 2537 angstroms is absorbed by mercury vapor. If a constant source of this radiation is placed at one end of a tube and a narrow-band photoelectric cell sensitive to this line is placed at the other end, a microammeter, connected through an amplifying system to the photocell, will indicate the amount of light falling on the cell. If the tube contains mercury vapor, some of the light will be absorbed and the microameter will give a different reading from that given when no mercury vapor is in the light path. The method presented allows the determination of 0.02 to 0.60 microgram of mercury in 150 to 400 cc of solution. Using a battery of recovery units, an operator can make 25 determinations per day. The method may be used with water-miscible solvent mixtures and with solutions from the digestion of solid organic materials. It is applicable to the estimation of mercury in biological materials after suitable preliminary digestive treatment. (See also W71-00167) (Knapp-USGS)

PHOTOMETRIC MERCURY ANALYSIS - CORRECTION FOR ORGANIC SUBSTANCES,
Eastman Kodak Co., Rochester, N.Y. Research Labs.
Albert E. Ballard, David W. Stewart, Warren O. Kamm, and Carl W. Zuehlke.
Analytical Chemistry, Vol 26, p 921-922, May 1954. 2 p, 2 tab, 2 ref.

Descriptors: *Laboratory tests, *Chemical analysis, *Water analysis, *Trace elements, Pollutant identification, Poisons, Photometry.
Identifiers: Mercury, Mercury analysis.

Methods are given for correcting for organic substances interfering with analysis of mercury by absorption photometry. After the reading using the mercury photometer has been obtained, the cell is immediately transferred to a spectrophotometer, and a second reading of absorbance is made at 2537 angstroms. Mercury vapor has no appreciable absorbance under these conditions, since it absorbs only a narrow line at 2537 angstroms, which represents a small fraction of the total energy in the

wave lengths represented in the effective band. Interfering organic substances, on the other had, generally have rather broad absorption bands and produce a substantial absorbance both in the mercury photometer and as measured by the other instrument. Accordingly, the amount of extraneous absorbance at 2537 angstroms can be approximately measured and applied as a correction to the mercury reading. (See also W71-00167) (Knapp-USGS)

BIOCHEMICAL-OXYGEN-DEMAND, DISSOLVED-OXYGEN, SELECTED-NUTRIENTS, AND PESTICIDE RECORDS OF TEXAS SURFACE WATERS, 1969 WATER YEAR,
Geological Survey, Austin, Tex.
Jean A. Schulze, Alton J. Dupuy, and Douglas B. Manigold.
Texas Water Development Board Report 120, September 1970. 22 p, 1 fig, 2 tab, 7 ref.

Descriptors: *Sampling, *Surface waters, *Texas, *Biochemical oxygen demand, *Dissolved oxygen, Nutrients, Pesticide residues, Water pollution sources, Water analysis, Water quality, Data collections.
Identifiers: Water quality records (Tex).

A network of daily and periodic chemical-quality stations on streams in Texas is operated by the U.S. Geological Survey in cooperation with the Texas Water Development Board and with other State, Federal, and local agencies. Analyses of water from this network include the principal inorganic constituents and related properties. BOD (biochemical oxygen demand), dissolved oxygen, and selected nutrients and pesticides are also determined at strategically located sites on most of the principal streams. Records of these periodic determinations were compiled through September 1968. (Knapp-USGS)

THE STATUS OF THERMAL DISCHARGES ON THE PACIFIC COAST,
California Inst. of Tech., Pasadena. W. M. Keck Lab. of Engineering Materials.
Wheeler J. North, and James R. Adams.
Chesapeake Science, Vol 10, No 3 and 4, p 139-144, Sept-Dec 1969. 2 fig, 3 tab.

Descriptors: *Thermal pollution, Thermal powerplants, Cooling water, Temperature, Regression analysis, Stratification, Water pollution sources, California, *Tidal waters.
Identifiers: Thermal discharge.

Thermal power stations that discharge waste heat from cooling water into tidal areas of California represent 85% or 16,982 megawatts (MW) of the total state thermal power capacity in 1969. The generation on tidal areas in Oregon is 169.5 MW, and in Washington is 77.9 MW. The surface area influenced in 35 measurements at 9 power station discharges was used to calculate a regression equation in which generation in MW was equated to surface area raised above normal temperature in acres. The linear regression for areas raised 2F above normal was Y — 104.422 .. .0902011 X, while the equation for areas raised 10F above normal was Y — 2.77812 .. .0126561 X. If all thermal stations in California were operated at maximum capacity, a total of 5.86 square miles of surface water would be raised 2F above normal, and 0.41 square miles would be raised 10F above normal, according to the regression equations. California has 400 square miles of bays and estuaries into which power stations discharge and a shoreline of 1205 miles. The average load factor (ratio of actual operating load to total capacity) at California tidal stations was 56% in 1966. (Upadhyaya-Vanderbilt)

THE DIURNAL CURVE IN ESTIMATES OF PRIMARY PRODUCTIVITY,
Federal Water Pollution Control Administration, Alameda, Calif. Southwest Region.
Charles M. Seeley.
Chesapeake Science, Vol 10, No 3 and 4, p 322-326, Sept-Dec 1969. 1 fig, 24 ref.

Descriptors: *Primary productivity, *Dissolved oxygen, Respiration, Photosynthesis, Water pollution effects.
Identifiers: *Diurnal curve, Saturation deficit, Diffusion coefficient, Aquatic system.

Changes in dissolved oxygen which occur in an aquatic system over a period of time are normally the result of: Photosynthetic production by aquatic plants within the water mass, respiration of aquatic plants, animals and bacteria, diffusion of oxygen into or out of the water, and advective gain or losses due to displacement of a water mass. Two principal approaches of the procedure are available to the investigator, the single-station method and the upstream-downstream method. The single-station method is described in this paper. Replicate sample for dissolved oxygen (mg/l) and water temperatures (C) are taken at intervals of three hours or less over a 24 hour period. Dissolved oxygen concentration and temperature data are plotted. Oxygen saturation values are determined and are graphed. An oxygen rate of change curve is constructed. Two points in time, the first shortly before sunrise and the second shortly after sunset (qm and qe) are chosen. The diffusion coefficient per volume, k, is calculated as k — 100 (qm - qe/Sm - Se) where qm and qe are the rate of change and Sm and Se are the percentage saturation deficit, before and after sunrise, respectively. Steps for obtaining the corrected rate-of-change curve, respiration rate and gross community photosynthesis are also described. (Upadhyaya-Vanderbilt)

EVALUATION OF CULTURE MEDIA FOR THE ISOLATION OF SALMONELLAE FROM FECES,
Iowa State Univ., Ames. Dept. of Veterinary Microbiology and Preventative Medicine.
R. M. Sharma, and R. A. Packer.
Journal of Applied Microbiology, Vol 18, No 4, p 589-595, 1969. 6 tab, 25 ref.

Descriptors: *Salmonella, *Farm wastes, *Cultures, Cattle, Hogs, *Isolation.
Identifiers: Brilliant Green MacConkey Broth, Tetrathionate Broth, Selenite Broth.

A study conducted on 300 fecal samples from a cow and a pig, each artificially contaminated with approximately four Salmonella organisms revealed that, of the three enrichment broths used in conjunction with the three selective media, the maximum number of isolations were obtained with Brilliant Green MacConkey broth (BGMB), followed by those obtained with tetrathionate (TTB), and the least with selenite broth. The combination of BGMB with Brilliant Green neutral red-lactose agar (BGNRLA), and TTB with desoxycholate citrate agar (DCA) gave an equal number of isolations. Of the three selective media used in conjunction with the three enrichment broths, the maximum number of recoveries were obtained on BGNRLA, followed by those on DCA, and least number of isolations on bismuth sulfite agar (BSA). The combination of selenite F broth-BSA appeared to be somewhat inhibitory for the growth of Salmonella organisms. Of the two selective media combinations, the DCA-BGNRLA combination yielded the highest number of isolations. The use of all three selective media gave still better results. (Miner-Iowa State)

IDENTIFICATION AND EXCRETION OF ESTROGEN IN URINE DURING THE ESTROUS CYCLE OF THE EWE,
Purdue Univ., Lafayette, Ind. Dept. of Animal Sciences.
E. D. Plotka, and R. E. Erb.
Journal of Animal Science, Vol 29, No 6, p 934-939, 1969. 2 fig, 1 tab, 27 ref.

Descriptors: Farm wastes, *Sheep, *Urine, Organic compounds, *Chromatography.
Identifiers: Estrone, *Estrogen, Pregnant ewes.

Estrone was identified in urine of the non-pregnant ewe by comparing its behavior to crystalline standard estrone and by its failure to separate from added 14C-estrone through solvent partitioning, paper chromatography, successive thin-layer chromatography in different systems, gas-chromotography, (GLC) on three columns, derivative forma-

on and chromatography of the derivatives. The ighest average rate of excretion of estrone and es- adiol occurred during estrus averaging 394 and 79 ug./24 hr. as compared to the lowest rates of) and 17 ug./hr., respectively, the second day ter estrus. Expressing excretion rate as ng/mg. of inary creatine was highly correlated (r-0.97- 98) to total excretion based on total collection of ine for 24 hours. (Miner-Iowa State)

ETERMINATION OF SUBMICROGRAM UANTITIES OF MERCURY IN LAKE ATERS,
epartment of Energy, Mines and Resources, rlington (Ontario). Canada Center for Inland aters.
u-Kee Chau, and Hirohumi Saitoh.
nvironmental Science and Technology, Vol 4, No , p 839-841, October 1970. 3 p, 2 fig, 1 tab, 12 f.

Descriptors: *Trace elements, *Heavy metals, *Pollutant identification, *Water pollution sources, *Lakes, Chemical analysis, Analytical techniques, Water analysis, Water chemistry, Poisons, Industrial wastes, Laboratory tests, Spectrophotometry.
Identifiers: Mercury.

A simple and sensitive method for the determination of submicrogram amounts of mercury in lake water was developed by combination of concentration by dithizone extraction and gas-phase atomic absorption. The mercury was first extracted by dithizone, back extracted by hydrochloric acid, and then converted to vapor by a reduction-aeration reaction. Hg, Hg (I), Hg (II), and some organomercuric compounds were extracted by the present procedure. A sensitivity of 0.008 micrograms per liter (0.008 ppb) was achieved for water analysis. Standard deviations of 0.0087 and 0.0042 were found for lake water samples containing 0.478 and 0.048 micrograms per liter of Hg, respectively. (Knapp-USGS)

RAPID PROCEDURES TO MONITOR WATER FOR POTABILITY,
Aerospace Medical Research Lab., Wright-Patterson AFB, Ohio.
Arnold R. Slonim.
Available from NTIS as AD-705 445, $3.00 in paper copy, $0.95 in microfiche. Aerospace Medicine, Vol. 39, No. 11, November 1968, p 1182-1189.
Identifiers: *Water supplies, Monitors, *Water pollution, Measurement, Accelerated testing, infrared equipment, Smell, Taste, Colors, pH, Particles, Organic compounds, Microbiology, Radiological contamination, Potable water, Turbidity.

The latest developments in methodology for monitoring aerospace water supplies for potability are described. Analytical techniques are emphasized that meet some of the following criteria: reproducibility, sensitivity of measurement, rapidity of analysis, instrumentational capability, and potential for aerospace monitoring. The leading instrumentational methods are the two recent combustion/infrared techniques for measuring organic pollution, one for total organic carbon and the other for chemical oxygen demand, and bioluminescence for determining microbiological contamination of water samples. Other potentially sound methods as well as future trends for aerospace applications are discussed.

AUTOMATED POTENTIOMETRIC TECHNIQUES FOR THE ON-SITE MONITORING OF ION CONCENTRATIONS IN WATER,
Missouri Univ., Columbia. Dept. of Chemistry.
Stanley E. Manahan.
Available from NTIS as PB-195 167, $3.00 in paper copy, $0.95 in microfiche. OWRR Completion Report, 1970. OWRR Project A-024-MO (11).

Descriptors: *Analytical techniques, *Water analysis, *Nitrates, *Electrodes, Ions, Fluorides, Algae, Volumetric analysis, Water chemistry.
Identifiers: Ion-selective electrodes, Standard addition, Potentiometry, Interfering ions.

The characteristics of the nitrate electrode - fluoride electrode cell without liquid junction were investigated for applicability to nitrate ion analysis. In addition to enabling accurate nitrate analysis, the cell was found to be useful for examining the effects of interfering ions. An attempt was made to use the nitrate electrode in following nitrate ion uptake by algal cultures. The algae interfere to a certain extent with the electrode response. Using knowledge gained from research under this grant a potentiometric nitrate analysis capability has been set up at the University of Missouri Environmental Trace Substances Laboratory.

TREATMENT OF ACID MINE DRAINAGE OF REVERSE OSMOSIS.
Rex Chainbelt, Inc., Milwaukee, Wis.

Available from NTIS as PB-195 200, $0.95 in microfiche. Also for sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, Price $0.55. I67.13/4:14010 DYK 03/70. Water Pollution Control Research Series 14010 DYK 03/70, March 1970. 35 p, 12 tab, 11 fig, 15 ref, append. FWPCA Project 14010 DYK.

Descriptors: *Reverse osmosis, *Acid mine water, *Mine drainage, *Demineralization, Waste water treatment, Osmosis, Pennsylvania, Dissolved solides, Iron, Manganese.
Identifiers: Shickskinney (Pennsylvania).

This report documents a study on the treatment of acid mine drainage by reverse osmosis. The objective of the study was to determine the feasibility of utilizing reverse osmosis to abate pollution due to acid mine drainage, and produce a water which could be used by industry or as a municipal water supply. A test site in Shickshinny, Pennsylvania was selected as a source of acid mine water. A sample of this water was tested in a laboratory reverse osmosis unit to determine the design parameters for a 10,000 gallon per day demonstration unit. This unit was operated for a period of 35 days on acid mine drainage as received from the Mocanaqua discharge near Shickshinny. Operation during this period was continuous, i.e., 24 hours per day. Daily samples of feed water, product water, and waste concentrate were analyzed to determine the effectiveness of the demonstration unit. The results obtained during the demonstration period indicated that the reverse osmosis process has potential application in acid mine drainage treatment. A high quality water was produced which was suitable for use by industries or municipalities with a minimum of additional treatment. There are, however, operational problems which must be solved prior to utilzing reverse osmosis on a large scale. These include maintenance of high permeation rates through the membrane by reducing membrane fouling and determination of the optimum flow sheet for an acid mine treatment system utilizing reverse osmosis. It is recommended that: (1) The mechanisms and method of reducing iron fouling of reverse osmosis membranes be evaluated in the laboratory using synthetic acid mine water; (2) The optimum flow sheet for treating acid mine drainage by reverse osmosis be determined by laboratory evaluation of synthetic acid mine water; and (3) The laboratory data be confirmed by a field evaluation period.

5B. Sources of Pollution

A STUDY OF GROUNDWATER POLLUTION BY SALT.

Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper I-34. 13 p.

Descriptors: *Water pollution sources, *Mine wastes, *Saline water intrusion, *Aquifers, *Alluvial channels, Salts, Saline water.
Identifiers: France, Rhine Valley, Alsace.

Pollution by brines of a groundwater in the Eastern part of France is described. The origin and intensity of the phenomenon, the measurement program, and the theoretical schemes which have been used to analyze and to predict the development of the pollution are discussed. The study was limited to the Rhine's alluvial aquifer in Alsace, a province of northeastern France. Its area is over 5000 square kilometers and its thickness varies between 0 and more than 200 meters. The beds consist of highly permeable Quaternary alluvial deposits (permeability about 0.001 m/sec) lying on an Oligocene marl substratum which is, in places, also covered by a Pliocene stratum of sandy clay. An increase of the sodium chloride content of the groundwater has been noticed, and it is ascribed to the presence of important potash mine-workings in the southern part of the district. (Knapp-USGS)

EFFECTS OF DENSITY DIFFERENCES ON LATERAL MIXING IN OPEN-CHANNEL FLOWS,

California Inst. of Tech., Pasadena. W. M. Keck Lab. of Hydraulics and Water Resources.
Edmund A. Prych.
California Institute of Technology, W M Keck Laboratory of Hydraulics and Water Resources Report No KH-R-21, May 1970. 225 p, 76 fig, 15 tab, 37 ref, append. FWQA Grants 16000 DGY and 16070 DGY.

Descriptors: *Mixing, *Turbulent flow, *Diffusion, *Dispersion, *Path of pollutants, Open channel flow, Estuaries, Streams, Streamflow, Stratified flow, Density, Density stratification, Model studies, Hydraulic models, Mathematical models, Turbulence.
Identifiers: Longitudinal dispersion, Lateral dispersion.

Lateral mixing of tracer fluids were studied in turbulent open-channel flows in which the tracer and ambient fluids have different densities. Longitudinal dispersion in flows with longitudinal density gradients were investigated also. Lateral mixing was studied in a laboratory flume by introducing fluid tracers at the ambient flow velocity continuously and uniformly across a fraction of the flume width and over the entire depth of the ambient flow. When there was a difference in density between the tracer and the ambient fluids, lateral mixing close to the source was enhanced by density-induced secondary flows; however, far downstream where the density gradients were small, lateral mixing rates were independent of the initial density difference. Normalized variance is a function of only three dimensionless numbers, which represent: (1) the x-coordinate, (2) the source width, and (3) the buoyancy flux from the source. Predicted longitudinal salinity distributions in an idealized laboratory estuary agree well with published data. (Knapp-USGS)

CIRCULATION, EFFLUENT DIFFUSION, AND SEDIMENT TRANSPORT, MOUTH OF SOUTH PASS, MISSISSIPPI RIVER DELTA,

Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
L. D. Wright.
Louisana State University Coastal Studies Institute Technical Report No 84, June 30, 1970. 56 p, 24 fig, 6 tab, 91 ref. ONR Project No N R 388 002.

Descriptors: *Mississippi River, *Deltas, *Sediment transport, *Saline water intrusion, Water circulation, Currents (Water), Mixing, Disperison, Suspended load, Density stratification, Density currents, Bed load, Turbidity.
Identifiers: Mississippi River delta.

A study was conducted at the mouth of South Pass, Mississippi River, to ascertain the influence exerted by interaction between effluent and ambient fluids; tides; waves; winds; bottom topography and channel mouth geometry; regional coastal currents; horizontal and vertical density gradients; and hydrologic regime of the Mississippi River. Downstream flow within the pass, as well as efflux seaward of the mouth, was swiftest during ebbing tide. Salt-wedge circulation in the lower reaches of the pass was characterized by upstream flow at flooding tide and downstream flow at ebbing tide. Statistical analyses indicated that river stage, tide, sea state, and position relative to the distributary mouth bar exert a significant influence on vertical stratification and mixing seward of the mouth. Stratification was most pronounced during high river stage, flooding tide, calm seas, and along the effluent axis, and weakened progressively from the mouth to the bar crest. In the fluvial-marine interaction zone immediately seward of the mouth, the freshwater effluent spread laterally as a relatively discrete and homogeneous mass. Suspended-sediment concentration varied directly with river stage and inversely with temperature. (Knapp-USGS)

EFFECTS OF URBANIZATION ON THE QUALITY OF SELECTED STREAMS IN SOUTHERN NASSAU COUNTY, LONG ISLAND, NEW YORK,

Geological Survey, Mineola, N.Y.
Ellis Koch.
Chapter C for sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402 - Price $3.25. In: Geological Survey Research 1970, Chapter C: Geological Survey Professional Paper 700-C, p C189 -C192, 1970. 4 p, 2 fig, 2 tab, 7 ref.

Descriptors: *Urbanization, *Water pollution sources, *New York, *Water quality, Streamflow, Surface waters, Runoff, Nitrates, Industrial wastes, Domestic wastes, Sewage disposal, Path of pollutants.
Identifiers: Long Island (NY), Nassau County (NY).

The water quality of the streams in southern Nassau County has diverged noticeably from natural conditions because of extensive urbanization. The quality of two streams in sparsely populated areas in Suffolk County was compared with the quality of three streams in moderately to densely populated parts of Nassau County. The estimated load of dissolved solids of all the southern Nassau County streams presently is about 10.5 tons per day greater than the estimated load under natural conditions. Furthermore, analysis of the data for certain constituents directly affected by man shows that the detergent content of the three streams in Nassau County ranges from County streams; the nitrate content is 14 times that of the Suffolk County streams; and the dissolved-solids content is about 3 to 4 times that of the Suffolk County streams. (K-napp-USGS)

USE OF CHANNEL SLOPE AND DISCHARGE TO DETERMINE REAERATION COEFFICIENTS FOR THE ELKHORN RIVER IN NEBRASKA,

Geological Survey, Lincoln, Nebr.
K. A. MacKichan, Neil G. Stuthmann, and Ray Bentall.
Chapter C for sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402 - Price $3.25. In: Geological Survey Research 1970, Chapter C: Geological Survey Professional Paper 700-C, p C193 - C197, 1970. 5 p, 4 fig, 1 tab, 6 ref.

Descriptors: *Reaeration, *Streamflow, *Channel morphology, *Slopes, *Discharge (Water), Nebraska, Velocity, Turbulent flow, Biodegradation, Self-purification, Waste assimilative capacity, Dissolved oxygen, Frequency analysis.
Identifiers: Elkhorn River (Nebr).

The reaeration coefficient, k, of a stream at a given point can be computed from an empirical formula expressing k in terms of mean velocity and mean depth. As both velocity and depth vary with discharge and channel slope, k for a given stream obviously can be expressed equally well in terms of discharge and slope. An equation is presented whereby k for any point along the Elkhorn River in Nebraska can be computed, using channel-slope data, for minimum 7-day discharges having different recurrence intervals. EFFECTS OF A CONCENTRATED ACID ON WATER CHEMISTRY AND WATER USE IN A PLEISTOCENE OUTWASH AQUIFER,

Geological Survey, Louisville, Ky. Water Resources Div.
Hayes F. Grubb.
Groundwater, Vol 8, No 5, p 4-7, September-October 1970. 4 p, 9 fig, 2 tab, 3 ref.

Descriptors: *Water pollution sources, *Industrial wastes, *Groundwater movement, *Recharge, *Surface-groundwater relationships, Malenclaves, Path of pollutants, Acids, Leaching, Chlorides, Glacial drift, Aquifers, Ohio River, Kentucky.
Identifiers: Hydrochloric acid.

A break in a waste-discharge line at the same time as a 49-foot rise in stage of the Ohio River in March 1967 allowed hydrochloric acid to enter the Pleistocene outwash aquifer used by a Kentucky industry. Chloride concentrations in excess of 30,000 mg/liter were observed in the water discharged from the industrial well nearest the break in the waste-discharge line. By March 1968, the well nearest the acid source was abandoned, the remaining two wells near the river were used in supplemental capacity and a fourth well 1,500 feet from the river plus a new well were the primary water sources. Fluctuations of chlorides in an industrial well near the river for a 16-month period indicate a persistent body of highly mineralized water near the acid source. Movement of this water

ody appears to be regulated at low river stages by ne inclined surface of the New Albany Shale edrock. (Knapp-USGS)

ANITARY BIOLOGICAL CONDITIONS, ROCESSES OF SELF-PURIFICATION AND ONTENT OF TRACE ELEMENTS IN THE ATERS OF THE RIVERS OF THE SHEKIAKATALY ZONE OF AZERBAYDZHAN,
F. Akhundov, T. V. Grekalova, N. I. Karayeva, nd S. M. Tenengol'ts.
ranslation of Gidrobiologicheskiy Zhurnal, Vol 5, o 2, 1969. Hydrobiological Journal, Vol 5, No 2, 29-32, 1969. 4 p, 3 tab, 4 ref.

escriptors: *Self-purification, *Reaeration, Rivers, *Path of pollutants, Industrial wastes, Oxgen demand, Oxygen sag, Waste assimilative apacity.
entifiers: *USSR, Azerbaydzhan.

ydrochemical and microbiological investigations ere made of the rivers of the Sheki Zakataly zone Azerbaydzhan. The principal rivers are polluted industrial wastes, but they are capable of self purification. The total quantity of microbes is as much 12 million colonies/milliliter. Analysis of the hemical composition of the waters of the rivers inestigated places them in the bicarbonate class. he waters of these rivers are either weakly or oderately mineralized. The high intensity of selfrification in mountain rivers is associated with ood aeration due to mixing. Its magnitude does ot depend upon the turbulence of the current: in e case of mountain currents with a rapid flow lf-purification is equal (at 15 deg C) to 0.74 as ompared with the case of lowland rivers in which is about 0.18. (Knapp-USGS)

EASONAL DYNAMICS OF THE REDUCING UGAR CONTENT OF WATER IN THE KIEV ESERVOIR AND INFLOWING RIVERS,
kademiya Nauk URSR, Kiev. Instytut idrobiologii.
. A. Yenaki.
Translation of Gidrobiologicheskiy Zhurnal, Vol 5, No 3, 1969. Hydrobiological Journal, Vol 5, No 3, p 47-50, 1969. 4 p, 2 fig, 1 tab, 13 ref.

Descriptors: *Reservoirs, *Eutrophication, *Carbohydrates, *Nutrients, *Biodegradation, Algae, Bacteria, Aquatic microorganisms, Sampling, Water analysis, Water quality, Pollutant identification.
Identifiers: Kiev Reservoir (USSR).

Carbohydrate-like compounds in natural waters play an important role in processes which occur within reservoirs and in particular in processes of formation and transformation of organic substances in natural waters. Monthly determinations were made in 1965 and 1966 of the reducing sugar content of water in the Kiev reservoir and the rivers flowing into it--the Dnieper, Pripyat', and Teterev. Determination of sugars was conducted on filtered water by a spectrophotometrical method. The high content of reducing sugars in water of the Kiev reservoir is one of the main factors responsible for the intensive development of microorganisms, the intensification of biochemical processes, and the transformation of biogenic elements. This condition involves an increase in the number of planktonic organisms and the occurrence of 'blooming' of the water. The content of reducing sugars in water of the Kiev reservoir in 1965 and 1966 varied from 0.26-1.33 mg/liter, and in the rivers flowing into the reservoir this value was equivalent to 0.17-1.63 mg/liter. The glucose carbon was equivalent to 0.7-6.7% and 0.9-4.1% of the total organic carbon, respectively. The maximum quantity of sugars was found in spring and summer, and the minimum quantity was found in winter. The increase in content of reducing sugars in the water of the Kiev reservoir was one of the factors which caused 'blooming' of the water in the spring-autumn period of 1966. (Knapp-USGS)
W71-00221

MICROBIAL OXIDATION OF SOME PETROLEUM PRODUCTS IN WATERS OF THE DANUBE RIVER,
Akademiya Nauk URSR, Kiev. Instytut Hidrobiologii.
N. A. Gavrishova.
Translation of Gidrobiologicheskiy Zhurnal, Vol 5, No 3, 1969. Hydrobiological Journal, Vol 5, No 3, p 29-34, 1969. 6 p, 2 fig, 3 tab, 21 ref.

Descriptors: *Oily water, *Biodegradation, *Bacteria, Aquatic microorganisms, Oxidation, Rivers, Self-purification, Oxygen demand, Biochemical oxygen demand, Path of pollutants.
Identifiers: Danube River (USSR).

Bacteria capable of oxidizing machine oils are widely found in waters of the Soviet sector of the Danube. Their number decreases sharply only during the winter period, when there is no navigation and the water temperature is low. The number of bacteria-oxidizing petroleum products, and also their ratio to the number of heterotrophic bacteria, characterize the waters of the Danube as being contaminated to a considerable extent. Bacteria consumed up to 1-6 mg oxygen per liter of water during 5 days for the oxidation of petroleum products. (Knapp-USGS)
W71-00222

THE ROLE OF HIGHER WATER PLANTS IN THE SELF-PURIFICATION OF OIL-POLLUTED RIVERS,
Northern Research Inst. of Hydraulic Engineering and Reclamation, Kazan (USSR). Dept. of Hydrology and Water Resources.
N. V. Morozov, R. B. Petrova, and G. N. Petrov.
Translation of Gidrobiologicheskiy Zhurnal, Vol 5, No 4, 1969. Hydrobiological Journal, Vol 5, No 4, p 37-42, 1969. 6 p, 11 ref.

Descriptors: *Oily water, *Surface waters, *Aquatic plants, *Self-purification, Laboratory tests, Water pollution, Foreign projects.
Identifiers: Cattail, Common reed, Bulrush, Blunt-leaved pondweed, Canadian pondweed.

The role of higher water plants in the disposal of an oil film on water is demonstrated. The experiments were conducted in glass vessels having a capacity of 15-20 liters and were placed in the open air. The plants used were those most common in bodies of water in the Middle Volga region, USSR. The oil film was rapidly destroyed by the microorganisms in the presence of the plants and as this happened a small quantity of brown moss-like projections formed on the lower surface and were gradually destroyed, partly settling or disappearing. In the course of the experiment, which extended through the phases of bud formation, flowering, and fruiting, almost 90% of the surface of the water in the vessels with an oil concentration of 1 g/liter was cleaned of the film: by the 3rd - 5th day with greater reedmace, the 5th - 6th day with bulrush, the 5th - 7th day with blunt-leaved pondweed, the 4th - 8th day with reed, and the 5th - 9th day with lesser reedmace. In the control vessels without plants a similar phenomenon was noted on the 28th - 32nd day. The addition of petroleum has a positive effect on the development of plants which grow above and below the water and on Canadian pondweed. A concentration of 100 g/liter kills the plants in 3-10 days and a concentration of 10 g/liter kills them over a longer period. (Knapp-USGS)
W71-00223

A METHOD FOR PREDICTING POLLUTANT TRANSPORT IN TIDAL WATERS,
California Univ., Berkeley. Hydraulic Lab.
Hugo B. Fischer.
University of California Water Resources Center contribution No. 132, March 1970. p 143, 16 fig, 9 tab, 21 ref. NSF Grant GK-3210.

Descriptors: *Pollutants, *Estuaries, *Computer programs, *Dispersion, Friction, Turbulence, Hydraulics, Mixing, Winds, Forecasting, Currents (Water), Water pollution sources, Water pollution control, *Model studies.
Identifiers: *Numerical models, Tidal velocities, Transport, Geometry two-dimensional.

A model for predicting pollutant distributions in estuaries is presented. The numerical model is entirely predictive, in-that it models both the hydraulics and pollutant transport without requiring field measurement of artificial coefficients. It can be used to study in advance of construction the effect of dredging, dike-building, or channel realignment, or the effect on an existing estuary of a new source of pollutant. An example of the use of the programs has been described. The importance of wind-induced circulation in the bay is shown by comparison of a run with wind and one without. Only the one-dimensional pollutant transport program has received field verification; the two-dimensional pollutant program has not been verified at all. (U-padhyaya-Vanderbilt)

QUALITY PREDICTIONS IN A POLLUTED ESTUARY,
Clyde River Purification Board, Glasgow (Scotland).
D. W. Mackay, and J. I. Waddington.
Fifth International Water Pollution Research Conference, San Francisco, July 26-Aug 2, 1970. Preprint, Paper III-7, 6 p, 4 fig.

Descriptors: *Estuaries, *Dissolved oxygen, Salinity, Tides, Temperature, Biochemical oxygen demand, Sampling, *Dissolved oxygen, Water pollution sources, Water pollution control.
Identifiers: Retention time.

Some methods adopted by the Clyde River Purification to investigate the system are outlined, and one case for which it has been possible to look back on the accuracy of prediction is described. The main shipping channel of the Clyde Estuary receives the drainage from a heavily industrialized

region with population of 2.4 million. The circulation of water in the estuary is extremely complex. During dry spells, the dissolved oxygen content of the upper estuary falls to zero for a distance of up to 20 km. The dissolved oxygen levels in the Clyde Estuary vary directly with the fresh water input and inversely with the temperature. Equations were derived linking these parameters at each of 13 stations spaced at 3.2 km: intervals seawards from the head of the estuary. The salinity, for a range of five depths at each sampling station, has been measured. Flows are expressed as percentage exceedences. Retention time in the upper 32 km of the estuary varies between 2 and 20 days depending mainly upon fresh water input. The sum of the product of BOD and retention time gives an index of pollution producing the observed dissolved oxygen deficit. It was predicted that a reduction of 13% in the overall dissolved oxygen deficit would result from beginning operation of the new treatment plant. The reduction in the dissolved oxygen deficit is 11% overall and is in satisfactory agreement with the prediction made. (Upadhyaya-Vanderbilt)

THE STATUS OF THERMAL DISCHARGES EAST OF THE MISSISSIPPI RIVER,
Bronx Community Coll., N.Y. Nursing Center.
Emanuel V. Sorge.
Chesapeake Science, Vol 10, No 3 and 4, p 131-138, Sept-Dec 1969. 6 tab.

Descriptors: *Thermal pollution, *Powerplants, Efficiencies, Temperature ecosystems, Water pollution sources.
Identifiers: *Thermal discharge.

At present 86 fossil fueled plants are discharging their thermal effluents into the waters abounding the East Coast. By 1980 power needs will require 200 billion gallons of water per day or approximately one sixth of our annual nationwide run off and nearly 32% of all power stations will be adjacent to various estuaries. By the year 2000, utility companies will be utilizing almost twice the national freshwater runoff and a lifetime supply of either 10 million tons of uranium or 100,000 million tons of coal. Advanced nuclear reactors, highly more efficient, will be needed to ensure the safety of our waterways. Fossil-fueled plants are approximately 40 percent efficient whereas nuclear fueled plants tend to be less efficient, at 33 percent. A 1000 MW nuclear fueled plant will utilize nearly 1.3 billion gallons of water per day. Though one plant may raise the temperature only a few degrees within a limited area from the discharge canal, an accumulation of heated effluent from multiple units could prove disastrous for many miles, especially during critical periods of the year. Tables are given listing the nuclear plants in operation, plants for which equipment has been ordered and thermal plants in East Coast and Central U.S. (Upadhyaya-Vanderbilt)

GASES AND ODORS FROM STORED SWINE WASTES,
Illinois Univ., Urbana. Dept. of Agricultural Engineering.
Arthur J. Muehling.
Journal of Animal Science, Vol 30, No 4, p 526-531, April 1970. 18 ref.

Descriptors: *Farm wastes, Ammonia, Manure, *Gases, Odor, Methane, Carbon dioxide, Hydrogen sulfide, *Hogs.
Identifiers: Swine confinement, *Manure odors, Storage pits.

One major problem arising from the storage, handling, treating and eventual utilization or disposal of hog wastes associated with confinement hog systems is the inevitable presence of gases and odors. The most important gases generated in a hog confinement unit are thought to be carbon dioxide, ammonia, hydrogen sulfide, methane and a large group of trace compounds such as amines, mercaptans, and skatoles. Under normal conditions in an adequately ventilated confinement unit no noxious gas reaches lethal or even harmful concentrations for pits or humans. Critically dangerous conditions exist when the oxygen content of the air diminishes from the normal 21 to 10% or less. It is only under special conditions such as during a ventilation failure, or during rigorous agitation of the manure pit that dangerous levels are reached. It may be possible to apply the industrial methods of treating odors; namely, dilution, absorption, adsorption, masking, counteraction and burning to the control or odors from stored manure. (Miner-Iowa State)

THE EFFECT OF HUMIDITY AND FLOORING TYPE ON THE MOISTURE CONTENT OF BROILER EXCREMENTS,
West Virginia Univ., Morgantown. Dept. of Animal Industries and Veterinary Science.
R. A. Peterson, M. A. Hellickson, W. D. Wagner, and A. D. Longhouse.
Poultry Science, Vol 49, No 2, p 439-443, March 1970. 1 fig, 2 tab, 2 ref.

Descriptors: *Farm wastes, Livestock, *Poultry, *Manure, Humidity, Air environment.
Identifiers: Broilers, Moisture content, *Flooring systems.

Experiments were conducted in part to determine the effect of humidity and flooring type on the moisture content of excreta from broilers. The experiments using broiler type chicks fed a high energy ration were conducted in four controlled 1.8 x 2.4 x 2.4 m environmental chambers. Relative humidity was measured and maintained. The following types were used, (1) 2.5 cm by 2.5 cm. welded wire (2) 1.3 cm. by 2.5 cm. welded wire and (3) 1.9 cm. flat wooden slats spaced 0.6 cm. apart. The average moisture content was significantly less in excreta collected under 1.9 cm. flat slats than collected beneath either 2.5 x 2.5 cm. or 1.3 x 2.5 welded wire floors. (Miner-Iowa State University)
W71-00327

EFFECT OF STRESS ON SWINE: HEAT AND COLD EXPOSURE AND STARVATION ON VANILMANDELIC ACID OUTPUT IN THE URINE,
Guelph Univ. (Ontario). Dept. of Nutrition.
M. P. Stefanovic, H. S. Bayley, and S. J. Slinger.
Journal of Animal Science, Vol 30, No 3, p 378-381, 1970. 1 fig, 2 tab, 12 ref.

Descriptors: *Hogs, Air temperature, *Urine, Amino acids, *Farm wastes.
Identifiers: Vanilmandelic acid output, Starvation, Metabolic response.

Tests were performed on 3 Yorkshire pigs in which they were subjected to normal conditions, extreme temperatures of 5 and 33C, and finally starved for 10 days at 20C. The urinary excretion of 3-methoxy - 4-hydroxymandelic acid (VMA) was measured when the pigs were housed in cages maintained at a room temperature of 20C. Observations of the VMA content was also made at times the pigs were under the stress conditions. The pigs increased in weight from 8 to 30 kg. during the 70 day experiment. Under normal temperature they excreted 10 mg of VMA per 24 hours. This increased to between 20 and 30 mg when the pigs were exposed to the low temperature. Exposure to the high temperature resulted in an excretion of 20 mg per day, but starvation caused a rapid decline to 3 mg per day. The excretion returned to normal values very rapidly when the animals were refed. These observations are discussed in relation to those made by other authors with other species on the effects of stress on the release and metabolism of catecholamines and their excretion in the urine, and it is suggested that the urinary output of VMA offers a convenient method of measuring physiological response to stress in the pigs. (White-Iowa State)

BACTERIAL CONTAMINATION IN POULTRY HOUSES AND ITS RELATIONSHIP TO EGG HATCHABILITY,
Pennsylvania Univ., University Park. Dept. of Poultry Science.
C. L. Quarles, R. F. Gentry, and G. O. Bressler.
Poultry Science, Vol 49, No 1, p 60-66, 1970. 8 tab, 15 ref.

Descriptors: *Farm wastes, *Bacteria, *Poultry, *Fertility, Eggs.
Identifiers: *Egg contamination, Egg hatchability, Air sampler, Litter houses, Litter nests, Wire floors, Roll-away nest.

This study was designed to determine if there was any relationship among poultry house contamination, egg contamination and hatchability. A high density sloping wire floor system was compared with the conventional litter floor system. Rates of egg production and fertility were similar in both systems. Litter houses averaged 9 times as many bacteria per cubic foot of air as wire floor houses. An attempt was made to study the level and transmission of coliform type bacteria as related to type of house and nest used. Hatchability of eggs in wire flood pens was superior to eggs from litter floor pens. Fungal contamination of air was approximately the same for both systems. (White-Iowa State)

PROBABLE SOURCES OF SALMONELLAE ON A POULTRY FARM,
Punjab Agricultural Univ., Hissar (India). Dept. of Veterinary Bacteriology and Hygiene.
S. M. Goyal, and I. P. Singh.
British Veterinary Journal, Vol 126, No 4, p 180-184, 1970. 2 tab, 17 ref.

Descriptors: *Farm wastes, *Salmonella, *Poultry, *Farm, Domestic animals, Rodents, Reptiles.
Identifiers: Salmonellosis, Transmission, Cross-infection.

This study was undertaken to determine various sources of Salmonellae on a poultry farm. Pigs, sheep, and other domestic animals were checked, as well as rats, sparrows, birds, and wall lizards. Eight Salmonellae types were isolated from poultry, pigs, rats, wall lizards, and house sparrows. S. anatum was isolated from all these sources and S. stanley from rats and poultry, indicating the possibility of cross-infection due to multiple foci of Salmonella infections. Rodents, free-flying birds and lizards were considered as important sources of Salmonellae. (White-Iowa State)

ATTRACTION OF COPROPHAGOUS BEETLES TO FECES OF VARIOUS ANIMALS,
Georgia Coastal Plain Experiment Station, Tifton.
G. Truman Fincher, T. Bonner Stewart, and Robert Davis.
The Journal of Parasitology, Vol 56, No 2, April 1970, p 378-383. 2 tab, 20 ref.

Descriptors: *Farm wastes, *Insects, *Habitats, Animal, Intermediate hosts.
Identifiers: *Beetle species, Pit traps, Feces, Woodland habitat, Swine pasture, Dairy pasture.

Beetles were attracted to pit traps baited with the feces of one of 12 different animals in 3 habitats. Comparison of the 3 habitats showed marked differences in beetle fauna. Most dung beetles were captured in traps baited with swine feces. Swine and opossum feces attracted 57.7% of all beetles

ptured and 74.8% of the Phanaeus species which e the major intermediate hosts of swine spirurids southern Georgia. Captured beetles comprised genera with more than 18 species. (White-Iowa ate)

UMIC SUBSTANCES: FULVIC ACID-DIAL-YL PHTHALATE COMPLEXES AND THEIR OLE IN POLLUTION,
epartment of Agriculture, Ottawa (Ontario). Soil search Inst.
nnar Ogner, and Morris Schnitzer.
ience, Vol 170, No 3955, p 317-318, October , 1970. 2 p, 17 ref.

escriptors: *Humic acids, *Soil physical proper-s, *Path of pollutants, *Fulvic acids, Soil con-mination, Toxins, Water chemistry, Pollutants, ater pollution sources, Aquatic environment, Or-nic compounds, Lakes.
entifiers: Dialkyl phthalate complexes.

he isolation and identification of small amounts of alkyl phthalates in fulvic acid is discussed and ggestions are made as to the possible role of ful-c acid in pollution. Fulvic acid is a water-soluble mic material with relatively low molecular eight that occurs widely in soils and waters. It can teract with lyophobic organic compounds such as kanes, fatty acids, and dialkyl phthalates, some of hich may be toxic pollutants. Fulvic acid may thus ediate the mobilization, transport, and immo-ization of such substances and contribute to the llution of the aquatic environment. (Lang-SGS)

entifiers: *Continental air pollution, Europe, At-ospheric transport, Particulates.

he question of whether or not air pollutants are nsported on a continental scale is examined by merical simulation. A simple atmospheric trans-rt and accumulation model, together with mean nd data and an estimated source distribution in estern Europe, were used. Results of the study ggest that Great Britain and Central Europe con-bute to observed concentrations of sulfur in orthern Europe. Pollutants are assumed to be ntained in the atmospheric belt within 3 km of rth surface. Mean winter concentration of total lfur in mg per cu m are plotted on three maps owing (1) sulfur emissions in all Western Eu-ropean countries, (2) all of Europe except the United Kingdom, and (3) sulfur emissions in only the United Kingdom. No natural sources are included nor are any sulfur removal mechanisms considered. The results suggest that in dry weather periods, when major removal devices are not in use, sulfur may be carried long distances. (Lang-USGS)

AIR POLLUTION SURVEILLANCE SYSTEMS,
National Air Pollution Control Administration, Cincinnati, Ohio. Bureau of Criteria and Standards.
George B. Morgan, Guntis Ozolins, and Elbert C. Tabor.
Science, Vol 170, No 3955, p 289-296, October 16, 1970. 8 p, 3 fig, 8 tab, 17 ref.

Descriptors: *Air pollution, *Aerosols, *Gases, *Surveys, *Instrumentation, Methodology, Remote sensing, Data collections, Atmosphere, Fallout, Air pollution effects, Pollutant identification, Urbanization, Rural areas.
Identifiers: *Particulates, *Surveillance systems.

Types of pollutants and their sources are summarized, current instrumentation and anticipated development of more specific and sensitive sensors are described, and the contrast between air quality in our urban environment and that of rural areas is discussed. Gaseous pollutants make up about 90% of the total mass emitted to the atmosphere with particulates and aerosols accounting for the remainder. Particularly important are small particulates in the respirable size range which may contain biologically active elements and compounds. These tend to remain in the air and interfere with both solar and terrestrial infrared radiation, which may affect global climate. Most devices and analyzers used for measuring air pollution are based on wet chemical methods. Extensive research is under way to develop remote sensing devices for use at ground level, in aircraft, and in earth satellites for area scanning and profiling. Concentrations of small particulates in rural areas of the country are increasing. Gaseous concentrations in larger cities show no trend, indicating downtown areas probably are source--saturated. (Lang-USGS)

POLLUTION OF LAKE ERIE, LAKE ONTARIO AND THE INTERNATIONAL SECTION OF THE ST. LAWRENCE RIVER.

International Lake Erie Water Pollution Board and International Lake Ontario-St. Lawrence River Water Pollution Board Report to International Joint Commission, 3 Vol, 1969. 796 p.

Descriptors: *Lake Erie, *Lake Ontario, *St. Lawrence River, *Water pollution, *Water pollution control, Surveys, Sampling, Legislation, Governments, International commissions, Great Lakes, Eutrophication, International waters.
Identifiers: International water pollution control boards.

Investigations were made to determine the extent and nature of pollution in the waters of Lake Erie, Lake Ontario and the international section of the St. Lawrence River. Data on which the report is based cover the period from 1963 through 1967, but further source information has been added in order to include significant observations. Lake Erie, Lake Ontario and the international section of the St. Lawrence River are being polluted on both sides of the boundary to an extent that is causing and is likely to cause injury to health and property on the other side of the boundary. There is substantial mixing of waters in the lakes to the extent that concentration levels of polluting materials are remarkably uniform throughout extensive areas of each lake. Thus, there appears to be no doubt that all major sources of pollution to the lakes have contributed directly, or indirectly, to their generally degraded condition. The major sources of pollution to the referenced waters are municipalities and industries. Municipal wastes comprise the principal source of phosphorus to the lower lakes. Municipal and industrial wastes also contribute dissolved and suspended solids, oxygen-consuming materials, toxic substances and pathogens. Remedial programs are suggested to be carried out promptly and on a continuing basis, to reverse the deteriorating conditions of the lakes. (Knapp-USGS)

5C. Effects of Pollution

EFFECTS OF ACID MINE WASTES ON PHYTOPLANKTON COMMUNITIES OF TWO NORTHERN ONTARIO LAKES,
Ontario Water Resources Commission, Toronto.

M. G. Johnson, M. F. P. Michalski, and A. E. Christie.
Journal Fisheries Research Board of Canada, Vol 27, No 3, p 425-444, 1970. 5 fig, 6 tab, 19 ref.

Descriptors: *Acid mine water, *Phytoplankton, *Lakes, Primary productivity, Waste treatment, Hydrogen ion concentration, Sulfates, Nitrates, Calcium, Carbon dioxide, Phosphorus, Silica, Chrysophyta, Cyanophyta, Lake Huron, Radioactivity, Radium radioisotopes, Physicochemical properties, Depth, Sampling, Bioassay, Ions, Carbon radioisotopes, Light penetration, Temperature, Diatoms, Ecosystems, Chlorophyceae, Water pollution effects, Water pollution sources.
Identifiers: *Ontario (Canada), *Uranium, Inorganic carbon, Dunlop Lake (Canada), Quirke Lake (Canada), Pecors Lake (Canada).

Differences between lakes contaminated by uranium-milling wastes and one unaffected lake were related directly to uranium extraction processes and subsequent waste treatment. Low pH and high concentrations of sulfates, nitrates, and calcium occurred in contaminated lakes; low concentrations of inorganic carbon, apparently limiting production, resulted from reduced solubility, loss, and possibly inefficient regeneration of carbon dioxide. Other major nutrients did not appear limiting, since there were more nitrates in contaminated lakes than in control lake; phosphorus and silica occurred in similar concentrations in all lakes. Lower phytoplankton populations and lower diversity indices were found in contaminated lakes; many species of Bacillariophyceae, Chrysophyceae, and Myxophyceae developed in unaffected lake but were absent or occurred rarly in contaminated lakes, with average primary productivities much lower. Bioassays confirmed the importance of inorganic carbon in limiting primary productivity. A potential compensatory mechanism in contaminated lakes was deepening of the euphotic zone. Although greater concentrations of inorganic carbon occurred and were assimilated in hypolimnetic than in epilimnetic waters, this did not overcome effects of reduction in species diversity and abundance of phytoplankton on areal primary productivity. EUTROPHIC EVALUATION OF A SMALL MULTI-LAND USE WATERSHED,
Marquette Univ., Milwaukee, Wis. Dept. of Civil Engineering.
Alphonse E. Zanoni.
Available from NTIS as PB-194 755, $3.00 in paper copy, $0.95 in microfiche. Research Project Technical Completion Report, June 30, 1970. 77 p. OWRR Project A-014-WIS (1).

Descriptors: Phosphorus compounds, *Eutrophication, Runoff, Fertilizer, Streams, *Watershed, Land-use, *Lake Michigan, Watershed management, Water pollution sources, *Phosphates, Farm wastes.
Identifiers: Menomonee River, Phosphorus loadings correlated to precipitation.

The Menomonee River watershed is a multi-land use watershed of 135 square miles area tributary to Lake Michigan. Approximately 370,000 people reside in the watershed which is 38% agricultural, 23% residential and the remainder divided among the other land use categories. Fifteen sampling sites were selected to evaluate the phosphorus loading from the watershed during various times of the year. During the two year investigation period, 30 sampling surveys were conducted and the samples were analyzed for total soluble phosphorus. A statistical investigation of the data showed that the phosphate concentration could not be correlated with precipitation amount, whereas, phosphorus pound loading could. The amount of phosphorus conveyed by runoff during precipitation periods varied considerably depending upon the amount of precipitation; varying from negligible amounts during low precipitation periods to high value of 83 pounds of phosphate per day per square mile during high precipitation periods. It was estimated that 1250 pounds per day of phosphate are discharged into Lake Michigan from the Menomonee River watershed, of which 40% is from treatment plant effluents.

POTENTIAL THERMAL EFFECTS OF AN EXPANDING POWER INDUSTRY: OHIO RIVER BASIN I,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Lab.
D. E. Peterson, and R. T. Jaske.
AEC Research and Development Report, BNWL-1299, UC-70, February 1970. 63 p, 22 fig, 9 tab, 8 ref.

Descriptors: *Ohio River, *Thermal pollution, Cooling water, Thermal capacity, Evaporation, Conduction, Water pollution effects, Waste water treatment, Powerplants.
Identifiers: *ORSANCO, *COLHEAT, Topping ponds, Topping towers, Back-end loading, Advected energy, Projected conditions.

Simulations of 1964 average stream temperatures of the Ohio River System were performed using the COLHEAT computer code. Average monthly direct cooling capacities of the Ohio River and its major tributaries (excluding the Cumberland and Tennessee Rivers) within a 5 deg F envelope were calculated and found to range between 261,000 and 95,000 MW sub T. Projected stream-electric loads and cooling facility trends for the Ohio Basin indicate that direct cooling water requirements will equal low monthly average direct cooling capacity by the year 1990. Ancillary cooling facilities for low flow periods could extend the use of direct cooling for a major part of the cooling requirements through the turn of the century. (Osborne-Vanderbilt)

THERMAL ADDITION AND THE BENTHOS, CAPE COD CANAL,
Fish and Wildlife Service, Fort Hancock, N.J.
Jack B. Pearce.
Chesapeake Science, Vol 10, No 3 and 4, p 227-233, Sept-Dec 1969. 5 fig, 2 tab.

Descriptors: *Thermal pollution, *Temperature, *Benthos, Mussels, Ecology, Heated water, Water pollution effects.
Identifiers: Cape Cod Canal, Fin-fish.

Based on laboratory experimentation and field observations a study was conducted concerning the possible effects of thermal additions on the finfish and benthic mussel communities found in Cape Cod Canal. The results from a variety of laborator experiments suggest that temperatures of 25C ad versely affected most of the experimental organ isms. Fish moved from 15.5C to 31C died withi one hour. Mussels can tolerate alternate exposur to hot and cold over long periods. The larvae an plantigrade spat of mussels are far more tolerant c temperatures increase than adults. Changes in mus sel behavior were evident at temperatures we below those which are normally lethal. Thermal ad ditions affect the feeding rates of the dominan predators on Mytilus, thus possibly affecting com munity stability. Elevated temperatures were als found to affect finfishes which are normally as sociated with mussel communities. (Upadhyaya Vanderbilt)

THERMAL INFLUENCE ON INVERTEBRAT RESPIRATION,
Duke Univ., Beaufort, N.C. Marine Lab.
F. John Vernberg, and Winona B. Vernberg.
Chesapeake Science, Vol 10, No 3 and 4, p 234 240, Sept-Dec 1969. 8 fig, 1 tab.

Descriptors: *Temperature, *Invertebrate *Respiration, *Metabolism, Life cycles, Habitat Water pollution effects.
Identifiers: Cyclic changes, Body size.

Most invertebrates cannot maintain a body tem perature independent of their environment. How ever, various physiological and ecological strate gies have evolved that enable poikilotherms t metabolically compensate for thermal changes. T evaluate the probable metabolic success of an or ganism in a region of thermal additions, a numbe of factors need to be considered. These includ body size, stage in the life cycle of an organism cyclic changes, and the habitat of the anima Metabolic-temperature curves are somewha characteristic for species even though the shap and position of the curve may be changed by the mal acclimation. This is best demonstrated by stu dies involving adult trematodes. (Upadhyaya-Van derbilt)
W71-00246

TEMPERATURE AND ZOOPLANKTON,
Maryland Univ., Solomons. Natural Resources Ins
Donald R. Heinle.
Chesapeake Science, Vol 10, No 3 and 4, p 186 209, Sept-Dec 1969. 18 fig, 8 tab, 22 ref.

Descriptors: *Zooplankton, *Temperature *Metabolism, Thermal powerplants, Growth rate Predation, Water pollution effects.
Identifiers: *Thermal tolerance, Seasonal pattern.

All metabolic rates of zooplankton are dependen upon temperature. Siefken and Armitage have sug gested independence from temperature in som cases but with non-conclusive evidence. Rate generally rise in a linear fashion, with one or two in flection points when plotted on a semi-log scale and fall at higher temperatures. The upper limits o thermal tolerance for two species of copepods fro Chesapeake Bay were found to be near the norma temperature of the habitat during the summer. Ac climation temperature had little effect on the uppe limits of thermal tolerance. Estuarine copepod were killed by passage through the condensers of powerplant, although temperatures encountere were generally below the upper limits of therma tolerance. Chlorine gas was applied at relativel high rates at that particular powerplant and i suspected to be the cause of mortalities. The opera tion of the powerplant did not alter the seasona patterns of distribution or production of estuarin copepods. (Upadhyaya-Vanderbilt)

GREENING AND COPPER ACCUMULATIO IN THE AMERICAN OYSTER, CRASSOSTRE VIRGINICA, IN THE VICINITY OF A STEAM ELECTRIC GENERATING STATION,
Maryland Univ., Solomons. Natural Resources Ins

Villem H. Roosenburg.
Chesapeake Science, Vol 10, No 3 and 4, p 241-252, Sept-Dec 1969. 5 fig, 21 ref.

Descriptors: *Oysters, Aquatic environment, Temperature, Thermal powerplants, *Copper, Salinity, Water pollution effects.
Identifiers: Concentrations, *Greening, Condition index.

The effects of heated effluent on oysters in the Patuxent River were investigated. Oyster meats near the outfall of a steam electric generating station started to display green color shortly after initiation of plant operation. In time, the affliction increased in intensity and spread to oyster stations farther removed from the outfall. The greening of Patuxent oysters was probably caused by copper uptake, since green color and copper concentration (mg of copper per g dried meat weight) were closely correlated. Copper content of oysters decreased with distance from the outfall. There was an inverse relationship between oyster condition and copper concentration. This was most evident at stations near the outfall where oysters had high copper content. Amounts of copper per oyster, based on mg of copper per liter shell cavity volume, did not display great seasonal fluctuation. Oysters at special stations, established to investigate a possible copper source upstream from the plant, showed a reduction in mg of copper per g dried meat, while oysters at stations inside and near the outfall increased sharply in mg of copper per g dried meat. Indications in the Patuxent point to a relationship between oyster copper uptake and power plant operation. (Upadhyaya-Vanderbilt)
W71-00248

THE USE OF CHLORINE IN THE COOLING WATER SYSTEM OF COASTAL POWER STATION,
Central Electricity Generating Board, Leatherhead (England). Central Electricity Research Labs.
J. S. A. Beauchamp.
Chesapeake Science, Vol 10, No 3 and 4, p 280, Sept-Dec 1969.

Descriptors: *Cooling water, *Chlorine, *Mussels, Water pollution effects, Powerplants.
Identifiers: Coastal stations, Bacterial slime, Growth.

In the intake conduits of coastal power stations marine fouling may build up to a remarkable extent. In two extreme cases the amount of marine fouling, consisting of barnacles, tube worms, mussels and debris, has exceeded 300 tons. The greatest hazard to station operation arises from the growth of mussels as these grow to a size that they can, when detached, block or partially block condenser tubes. The schedule now being used is to inject chlorine continuously at a rate of 0.5 ppm. It seems that combined chlorine or combined bromine, probably in the form of bromamines, is extremely distasteful to mussels. Bacterial slime that forms in the condensers can be controlled by injecting chlorine at 2-3 ppm for 15 minutes every 4 hours. The adoption of a schedule of low level chlorination for the control of marine fouling has made it possible to carry out trials on the farming of sea fishes using the warm water discharged from power stations. (Upadhyaya-Vanderbilt)
W71-00249

ALLOWABLE THERMAL POLLUTION LIMITS AS A PHYSICOCHEMICAL APPROACH,
Miami Univ., Fla. Inst. of Marine and Atmospheric Sciences.
Walter Drost-Hansen.
Chesapeake Science, Vol 10, No 3 and 4, p 281-288, Sept-Dec 1969. 22 fig, 33 ref.

Descriptors: *Thermal pollution, *Temperature, Membranes, Viscosity, Respiration, Water pollution effects, *Physicochemical properties.
Identifiers: Conductance, Biochemical reaction, Optical density.

The existence of abrupt changes, at certain discrete temperatures, in biochemical reaction rates and in the behavior of biological systems, has been known for years. In systems where no active transport is expected, anomalies are often observed in the vicinity of 15, 30, and 45C. It appears, in general, that water near interfaces, regardless of solute present, is capable of undergoing abrupt changes, probably reflecting higher order phase transition. An upper thermal limit for the survival of many organisms is found to be at 30-33C. Multiple temperature optima in an organism may be the result of the utilization temperature intervals. A very intense, concerted study of the simultaneous influences of various parameters, including temperature, at closely-spaced values of the parameters, is needed. (Upadhyaya-Vanderbilt)
W71-00250

DETERMINATION OF UPPER TEMPERATURE TOLERANCE TRIANGLES FOR AQUATIC ORGANISMS,
Maryland Univ., Solomons. Natural Resources Inst.
Andrew J. McErlean, Joseph A. Mihursky, and Howard J. Brinkley.
Chesapeake Science, Vol 10, No 3 and 4, p 293-296, Sept-Dec 1969. 3 fig, 8 ref.

Descriptors: *Aquatic environment, Fish, *Temperature, Resistance, Thermal pollution, Water pollution effects.
Identifiers: *Tolerance polygon, Linearity, Aquatic organism, Rank correlation, Acclimations.

Temperature tolerance polygons are constructed by plotting lethal temperatures (LD50) for different acclimations against the temperature of acclimation, Ta. Area of the polygons give thermal tolerances. The effect of plotting (LD50-Ta) against Ta is to linearize the LD50 points. To examine this linearity, the difference (LD50-Ta) was determined for a variety of fish species and plotted against Ta. In most cases a line may be fit to the data points by eye since the data points are virtually colinear. The calculated upper tolerances for these 18 species were compared to those given in Brett by rank correlation. A rank correlation of 0.95 was obtained although some rank inversions occurred. The advantage of the method is that the area defined by the triangle may be easily measured and upper temperature tolerance may be expressed as a single numerical value. Relatively few LD50 determinations, perhaps as few as four, are required to obtain an estimate of upper tolerance. A possible limitation of the technique is that it may overestimate upper tolerance for temperature - intolerant organisms at higher acclimations. (Upadhyaya-Vanderbilt)

DESTRUCTION OF PHYTOPLANKTON IN THE COOLING WATER SUPPLY OF A STEAM ELECTRIC STATION,
Maryland Univ., College Park. Dept. of Zoology.
Raymond P. Morgan, II, and Raymond G. Stross.
Chesapeake Science, Vol 10, No 3 and 4, p 165-171, Sept-Dec 1969. 3 fig.

Descriptors: *Thermal pollution, *Phytoplankton, *Photosynthesis, Temperature, Time, Primary productivity, Water pollution effects.
Identifiers: Cooling water supply, Steam electric station, Carbon uptake, Thermal inhibition.

Rates of photosynthesis were used to evaluate the response of phytoplankton when passed through the cooling system of a power generating facility. Photosynthesis was measured as the uptake of carbon. A factorial design permitted evaluation of heat input, total effect of passage, and degree of recovery. Six experiments measured response at a fixed time of day and at various times in a daily cycle. An increase in temperature of approximately 8.0C stimulated photosynthesis when natural water temperatures were 16C or cooler and inhibited photosynthesis when natural water temperatures were 20C or warmer. Passage through the cooling system resulted in further inhibition when the water was warm and nullified thermal stimulation when the water was cool. No recovery was observed within a four hour period following passage. Photosynthesis in cooled effluent water was either unaffected or actually suppressed. The existence of daily synchrony in the algae was shown by a daily maximum of thermal stimulation at 0900. The rhythm is considered inherent and only amplified by warming. (Upadhyaya-Vanderbilt)
W71-00253

TEMPERATURE AND ROOTED AQUATIC PLANTS,
American Univ., Washington, D.C. Dept. of Biology.
Richard R. Anderson.
Chesapeake Science, Vol 10, No 3 and 4, p 157-164, Sept-Dec 1969. 4 fig, 2 tab.

Descriptors: *Temperature, *Rooted aquatic plants, Respiration, Statistical methods, *Heated water, Water pollution effects.
Identifiers: Oxygen consumption, Leaf size, Ruppia maritima, Potamogeton perfoliatus.

In relation to the disappearance of a Ruppia maritima population near the effluent of an electrical generating station on the Patuxent River, Maryland, temperature effects on respiration and photosynthesis of aquatic plants was studied. A Gilson differential respirometer was used to investigate respiratory variation in leaves of Potamogeton perfoliatus at 25, 30, 35, 40, and 45C. This species grows with Ruppia maritima, appears to be more tolerant of high temperatures, and plant material was readily available. Plants growing in heated and non-heated water were compared. The data indicate that Potamogeton perfoliatus is capable of physiological adjustment to higher temperatures as the leaf matures, since only older leaves tended to respire less at the elevated temperatures. Death of plant material occurred at 45C. (Upadhyaya-Vanderbilt)

SOME ECOLOGICAL RELATIONSHIPS OF THE ORGANIC DRIFT IN PRATER'S CREEK, PICKENS COUNTY, SOUTH CAROLINA,
Clemson Univ., S.C. Dept. of Entomology and Zoology.
William Kenneth Reisen.
Unpublished Masters Thesis, Clemson University, Clemson, South Carolina. December 1968. 127 p, 13 tab, 35 fig, 75 ref. OWRR Research Report A-013-SC (5).

Descriptors: *Organic drift, *South Carolina, *Ecological Relationships, Regression analysis, Qualitative, Quantitative, Fluctuations, Density dependency, Carrying capacity, Productivity, Seasonal, *Benthic fauna, Abundance, Feeding activity, Spawning, Plumpness, Temperature, Oxygen concentration.
Identifiers: *Reptilia, *Amphibia, *Osteichthyes, Cyprinoiformes, Perciformes, *Insecta, *Crustacea, *Bottom communities, Literature review, Condition factor.

An ecological study was conducted in Prater's Creek, Pickens County, South Carolina to observe the qualitative and quantitative fluctuations of the

organic drift through time, both diurnally and monthly. The relationships of organic drift with benthic density and emergence were investigated. The density dependency of the drift was tested to ascertain its relationship with carrying capacity and productivity. The dependency of the fish community on drift as a food source was also investigated. It was concluded that drift fluctuates both qualitatively and quantitatively through time as a function of light, time of day with density and seasonally. The relationship between drift and benthic density and relative abundance was found to be both density dependent and density independent depending upon the taxa considered. Consequently, the overall productivity of a given stream segment could not be estimated on the basis of drift. Fish were found to depend only slightly on drift for food. This was a function of both habitus and habitat. Feeding activity, condition factor and spawning of the fish were all found to be synchronized with fluctuations in the total drifting biomass. EFFECTS OF SAN DIEGO'S WASTE WATER DISCHARGE ON THE OCEAN ENVIRONMENT,
Water Resources Engineers, Inc., Walnut Creek, Calif.
Carl W. Chen.
Journal Water Pollution Control Federation, Vol 42, No 8, Part 1, p 1458-1467, August 1970. 10 p, 3 fig, 7 tab, 3 ref.

Descriptors: *Outlets, *Sewage disposal, *California, *Water pollution effects, *Aquatic life, Aquatic habitats, Aquatic environment, Sea water, Water quality, Water pollution sources.
Identifiers: Marine outfalls, San Diego (Calif).

Studies of the ocean environment near the city of San Diego waste water outfall include variance and time series analyses to discern physical, chemical, and biological changes and population trend and composition of biota. The outfall performed effectively in diffusing wastes to the environment. The environment was gradually reaching an equilibrium state. The marine ecosystem was relatively stable in both planktonic and benthic composition. The benthic populations were stimulated by the waste discharge and the deposit of organic matter. (Knapp-USGS)

EFFECTS OF ACID MINE DRAINAGE ON WATER QUALITY OF A RESERVOIR,
Pennsylvania Dept. of Health, Harrisburg. Div. of Water Quality; Missouri Univ., Columbia. Dept. of Zoology; and Missouri Dept. of Conservation, Columbia. Div. of Fisheries.
Edward R. Brezina, Robert S. Campbell, and James R. Whitley.
Journal of the Water Pollution Control Federation, Vol 42, No 8, Part 1, p 1429-1436, August 1970. 8 p, 4 fig, 4 tab, 19 ref. OWRR Project B-001-MO.

Descriptors: *Acid mine water, *Water pollution effects, *Reservoirs, *Missouri, Sulfates, Acids, Mine drainage, Water quality, Alkalinity, Monitoring, Water pollution sources, Water chemistry.
Identifiers: Montrose Reservoir (Mo).

To determine whether acidic water draining from strip mines altered the water quality of Montrose Reservoir and tributary Deepwater Creek in Missouri, water samples were analyzed for pH, potential free acidity, specific conductance, bicarbonate alkalinity, and sulfate ion concentration. Acid inflow resulted in a slight increase in specific conductance, a slight decrease in bicarbonate alkalinity, and a slight increase in sulfate ion concentration in Montrose Reservoir. The relationship of time of acid inflow to rainfall was established by hourly monitoring of water quality in Deepwater Creek before, during, and after heavy rainfall. Changes in water quality were minimal except immediately after precipitation began. (Knapp-USGS)

THE INFLUENCE OF FLOW ON THE SPAWNING OF BROOK TROUT IN THE LABORATORY,
National Water Quality Lab., Duluth, Minn.
John G. Hale, and Donald A. Hilden.
Transactions of the American Fisheries Society, Vol 99, No 3, p 595-597, July 1970. 1 tab, 4 ref. FWQA Project ETK 18050---9/70.

Descriptors: *Spawning, *Life History Studies, *Bioassay methods, Water pollution effects.
Identifiers: Flowing-water system, Substrate.

Information was needed on the spawning success of adult brook trout maintained on a diet of commercial trout pellets in the laboratory under controlled light through one complete reproductive cycle. It was also planned to determine whether or not brook trout would spawn in the test tanks where the flow was periodic and compare the results with spawning in coninuous flow at a constant delivery rate. Gravel, 1/4 to 1 inch in diameter and glass marbles 1/2, 9/16, and 7/8 inch in diameter were tried as spawning substrate. Marbles were tried because glass does not react with most toxicants; whereas, it is possible that gravel might react with some toxicants to alter the concentration in a long-term study. Spawning was not considered successful with marbles since no eggs were buried. The female in the tank containing marbles was spent indicating that she had spawned but her eggs were exposed, and probably onsumed by fish in the tank. Spawning took place in tanks with a constant flow, as well as in tanks with periodic flow. The rate did not appear to influence spawning success, since it was accomplished at 1/2, 1, and 2 liters a minute. (Hale-FWQA)

THE IRRELATION OF CARBON AND PHOSPHORUS IN REGULATING HETEROTROPHIC AND AUTOTROPHIC POPULATIONS IN AQUATIC ECOSYSTEMS,
Federal Water Quality Administration, Athens, Ga. National Pollutants Fate Research Program.
Pat C. Kerr, Doris F. Paris, and D. L. Brockway.
Available from NTIS as PB-195 195, $0.95 in microfiche. Also for sale by Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, Price $0.60, I67.13/4:16050 FGS 07/70. Water Pollution Control Research Series 16050 FGS 07/70, (July 1970). 53 p, 4 tab, 17 fig, 51 ref. FWQA Project 16050 FGS.

Descriptors: Cycling nutrients, *Carbon, *Phosphorus, *Cyanophyta, Aquatic environment, Carbon dioxide, Ecosystems, South Carolina, Algae, Trophic level.
Identifiers: *Antotrophic populations, *Heterotrophic populations, Lake Hartwell (South Carolina), Anacystis nidulans, Aquatic ecosystems, Algae growth, Algal populations.

Laboratory and field investigations were conducted on the fate and cycling of carbon and phosphorus in selected aquatic ecosystems. Inorganic carbon, as CO2, supplied by both bacterial cultures and cylinder gases, stimulated the growth of the blue-green alga Anacystis nidulans. The carbon requirement (10-5 ug CO2 per cell) for this alga was determined for a single set of experimental conditions. The addition of CO2 to natural water low in phosphorus (5 ug P) and nitrogen (5 ug N) in the laboratory stimulated the growth of indigenous algal populations. The limiting and luxury cellular concentrations of phosphorus for starved Anacystis nidulans were found to be 0.3 x 10-8 ug P and 3.0 x 10-8 ug P per cell, respectively. Diel studies of a stream which received biologically-treated sewage demonstrated that the dissolved CO2 and HCO3 continually produced in the system were essentially depleted by the autotrophic organisms during daylight hours, while the concentration of phosphorus (1.3-2.2 mg/l P) remained unchanged. Addition of organic carbon and inorganic nitrogen and phosphorus along and in combination to the waters studied directly stimulated the oxidative metabolism of the heterotrophic population, which resulted in increased dissolved CO2 and HCO3-. This increased availability of inorganic carbon, rather than the direct metabolic removal of dissolved phosphorus by the algae, appeared to be directly responsible for the growth of the algal populations in the waters studied.

NAUVOO BLACK CREEK COAL CO V JOHNSON (LIABILITY FOR SUBSTANTIAL INJURY CAUSED BY STREAM POLLUTION).

160 So 242-244 (Ala 1935).

Descriptors: *Alabama, *Cultivated lands, *Damages, *Water pollution, Pollutants, Watercourses (Legal), Pollutant identification, Overflow, Riparian land, Riparian waters, Riparian rights, Relative rights, Mining, Mine wastes, Judicial decisions, Legal aspects, Adjudication procedure.

Plaintiff landowner sought damages for alleged permanent injury to his property, agricultural lands, which he alleged was caused by defendant's pollution of a stream running therethrough. From a judgement for plaintiff, defendant appealed based on the trial court's charge to the jury. The court held to be adequate a charge to the jury that while defendant had the right to use the stream above plaintiff's land for mining purposes, he did not have the right to place in said stream or tributaries thereof any substance that would be deposited on plaintiff's land that would cause injury or deterioration thereto. The omission of the words 'substantial' or 'material' from said charge did not mislead the jury in light of the court's oral charge that plaintiff could recover only for substantial injury. The judgment for plaintiff was affirmed. (Price-Florida)

5D. Waste Treatment Processes

WASTE WATER TREATMENT FOR RETURN TO NATURAL CYCLE REUSE,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio. Cincinnati Water Research Lab.
F. M. Middleton.
Water and Wastes Engineering, Vol 5, p 61-64, 1968. 1 fig, 2 tab, 12 ref.

Descriptors: *Waste treatment, *Waste water disposal, *Water reuse, Water purification, Oxygen demand, Solid wastes, Bacteria, Nutrients, Waste water treatment, Anaerobic digestion, Phosphorus, Nitrogen, Thermal pollution, Dissolved solids, Odor, Disinfection, Economics, Water quality.
Identifiers: Nutrient removal, Water quality criteria.

Changes of concepts and treatment processes to adequately control natural recycle and reuse of waste water effluents are discussed. Treatment can be improved by better operation of existing plants: controlling organic and hydraulic overloads, operation of facilities and adequate testing to permit optimum operation. New plants should be designed to eliminate digesters since large amounts of biochemical oxygen demand, nitrogen, and phosphate in supernatants or elutriates are returned to the process only to cycle again and discharge into the effluent. For new processes consideration should be given whether new problems are created. Better removal of oxygen-demanding materials is required, as well as a large percentage of carbon and nitrogen in wastes. Present technology can reduce phosphorus by 80% without large capital expenditures. The diversity of waste treatment systems allow their application to local situations. Nitrogen removal is feasible by ammonia stripping and biological nitrification-denitrifica-

ion; other techniques lack adequate full-scale testing. More effort must be directed to eliminate dissolved solids, heat, and odor-potential of discharged wastes. Disinfection is more effective and economical when the effluent is free of solids, organics, and ammonia. (Haskins-Wisconsin)

INORGANIC CHEMICAL INDUSTRY: CLEAN WATER COST ESTIMATE.

Environmental Science and Technology, Vol 14, No 6, p 469-470, June 1970. 1 fig.

Descriptors: *Costs, *Chemicals, *Inorganic compound, *Waste water treatment, Industrial wastes.

Economics of clean water' the third annual report o Congress on the cost of clean water for the United States contains waste water treatment profiles for municipalities animal feed lot wastes, and inorganic chemicals industry. This report details the in-depth cost estimates achieving certain levels of waste water treatment within these particularly troubled areas. During the 5 year period from 1970 to 1974 the inorganic chemicals industry will have to increase outlays nearly 8 fold to each the 100% level of treatment. To keep its present level of treatment the industry must increase present outlays for capital and operating expenses more than 50% from 414.5 million in 1970 o 630.2 million in 1974. The main problem with he treatment of industry's wastes is the solids, both dissolved and suspended. In general biological methods of treatment are not applicable for physical treatment of equalization, neutralization, flocculation, sedimentation, and sludge dewatering are employed. The cost estimates for treatment were developed for 4 levels of flow rates, 3 levels of acidity, 2 levels of suspended solids and 3 levels of otal dissolved solids. However, the data from the 59 plants, representative of the 2,700 plants in the United States, were not sufficiently complete with regard to effluent quality to construct a statically significant relationship between the numbers of plant and the effluent quality parameter such as acidity, suspended solids, and dissolved solids. (Hancuff-Texas)

ACTIVATED SLUDGE (LITERATURE REVIEW),
Water Pollution Control Federation, Washington, D.C.
H. S. Azad, D. E. Bergmann, and M. R. Stumpf.
Journal of the Water Pollution Control Federation, Vol 42, No 6, p 897-910, June 1970. 105 ref.

Descriptors: *Activated sludge, *Waste water treatment, Sewage treatment, Biological treatment, Mathematical models, Aerobic treatment, Industrial wastes, Performance, Evaluation, Oxygenation, Temperature, Mixing, Nutrients, Costs, Microbiology, Toxicity, Economics.
Identifiers: Growth, Settling.

The 1969 literature on the activated sludge process s reviewed. A variety of process modifications is discussed, and include: rotating disc biological contactor and wasting activated sludge solids to the preaeration tank ahead of the primary settling tank. Industrial applications include: distillary wastes, slaughter house wastes, starch wastes, aliphatic compounds, vegetable tanning liquors, chrome tanning wastes, dye wastes, phenolic wastes, petrochemical wastes, and organophosphorus pesticides. The cost of a centrally combined industrial waste water treatment complex treating wastes from separate industries is presented. Evaluation of a thermophilic activated sludge system is presented and the influence of temperature on settling developed. The influences of oxygen transfer efficiency are described and a variety of aeration systems discussed. The influence of nutrients, namely, nitrogen and phosphorus are presented from the standpoint of kinetics as well as removal efficiencies. The inhibitory or toxic effects of various compounds on activated sludge process are discussed. Boron, cyanide and various metals are cited as examples. A variety of studies on the design and operation of settling, dewatering and thickening are described. (Hancuff-Texas)

STEEL INDUSTRY WASTES (LITERATURE REVIEW),
Water Pollution Control Federation, Washington, D.C.
S. E. Smith.
Journal of the Water Pollution Control Federation, Vol 42, No 6, p 1198-1205, June 1970. 63 ref.

Descriptors: *Steel, *Industrial wastes, *Waste water treatment, Iron, Chemicals, Ion exchange, Electrodialysis, Oxidation, Neutralization.
Identifiers: *Pickling.

Recent literature pertaining to the steel industry wastes is reviewed. A large portion of the literature has been dedicated to ways of using the waste water as a product or ways of using one waste water to treat another. A great deal of attention was also devoted to the recycling of components of the waste water within the plant. A discussion is presented on several pilot plant studies made for the control of pollution from steel manufacturing in particular hot rolling. A very large number of studies were made on the treatment of pickling waste water. Several of these concentrated on merely meeting water quality requirements while others concentrated on recapture and reuse of the waste materials. The most commonly recovered items were gypsum and magnetic iron oxides. The processes such as chemical precipitation, ion exchange, electrodialysis, neutralization and oxidation are reported for the treatment of pickling wastes. The need for an iron containing fertilizers in arid regions and a non-sodium substitute for the sodium chloride regenerant in water softening are discussed in the light of using ferric chloride as a substitute. Ferric chloride is also recovered from pickle liquors. Deep-well injection of spent pickle liquors received some attention and the construction and operation of disposal is described. (Hancuff-Texas)

AGRICULTURAL (LIVESTOCK) WASTES (LITERATURE REVIEW),
Water Pollution Control Federation, Washington, D.C.
J. R. Miner.
Journal of the Water Pollution Control Federation, Vol 42, No 6, p 1171-1179, June 1970. 59 ref.

Descriptors: *Agriculture, *Industrial wastes, *Waste water treatment, Odors, Cattle, Crops, Biological treatment, Dairy industry, Poultry.
Identifiers: Manure, Feed lots.

Recent literature concerning agricultural waste disposal is reviewed. The problems associated with water pollution control related to cattle feed lot runoff were discussed in relation to the characteristics, handling, treatment, utilization, disposal and odor problems of livestock manure. A review of research pertaining to swine waste management includes discussions of manure properties, application to cropland, treatment technology, alternatives for disposal or utilization, and gases and odors related to manure storage. The production, value, use, and disposal of poultry manure is also included. The value of poultry manure as a fertilizer for specific crops is discussed. A great deal of study has been made on the gases and odors evolved from manure decomposition and a court case is sited in which an award of $36,000 was made due to water pollution and odors. Some wastes which are characterized are from steer, sheep, poultry, and storm runoff from a variety of cropland. A great deal of study was done on cattle feed lot wastes and various methods of treatment. The application of partly treated livestock wastes to cropland has been of growing interest. The largest problem occurring with this type of disposal is the contamination of the groundwater by nitrogen mostly in the form of nitrates. A variety of biological treatment processes were studied including lagoon, aerated lagoons, extended aeration, anaerobic digestion, and aerobic digestion. (Hancuff-Texas)
W71-00122

PLATING AND CYANIDE WASTES (LITERATURE REVIEW),
Water Pollution Control Federation, Washington, D.C.
W. N. Grune.
Journal of the Water Pollution Control Federation, Vol 42, No 6, p 1211-1230, June 1970. 97 ref.

Descriptors: *Industrial wastes, *Waste water treatment, *Metals, Water pollution control, Ion exchange, Chromates.
Identifiers: *Plating, *Cyanide, Recovery, Reuse.

In recent years, the use of electrochemistry to help clean up various industrial wastes, including those from steel pickling plants and plating operations, has steadily increased. The most important objectives of waste treatment of these industries is the removal or reduction of toxic materials. A great deal of interest was shown in the development of waste treatment plant automation and continuous analysis of effluent quality. A large number of examples of controls are presented. The possibility of treating cyanide wastes through biological treatment was shown by several investigators. Designs and operating characteristics of ion exchange units used for removal of plating wastes are discussed. A review of the various methods for cyanide control including (1) dilution, (2) alkaline chlorination, (3) electrolytic oxidation, (4) vacuum evaporation, and (5) ion exchange is presented. Commercially available equipment and processes also are reviewed. Potential recovery and reuse of cyanides and chromates is given some consideration and methods are described. The potential water pollution problem evolving from disposal of cyanides in water and streams is summarized. (Hancuff-Texas)
W71-00123

TANNERY WASTES (LITERATURE REVIEW),
Water Pollution Control Federation, Washington, D.C.
J. D. Eye.
Journal of the Water Pollution Control Federation, Vol 42, No 6, p 1188-1189, June 1970. 13 ref.

Descriptors: *Industrial wastes, *Waste water treatment, Biological treatment, Activated sludge, Chromium, Sulfides.
Identifiers: *Tannery wastes, *Leather.

Recent literature on tannery wastes and tannery waste treatment is reviewed. The effect of trivalent chromium derived from tannery wastes on biological treatment processes was found to have little effect even at high initial concentrations because of the precipitation of chromium hydroxide on mixing with high alkaline wastes. Several biological pilot scale studies are reported. In one anaerobic-aerobic pilot unit the spent vegetable canning solutions derived from a sole leather tannery was treated to about 85% efficiency for the removal of BOD and suspended solids. A completely mixed activated sludge system on a pilot scale was studied for treating wastes from 5 other tanneries. BOD removals of 90% were observed. Chromium did not effect the process adversely. A pilot plant study of the treatment of the combined wastes from 19 tanneries, 8 other industries and 2 municipalities is discussed. A small scale two stage activated sludge system was utilized for studying tannery waste treatment and it was found that sulfides as high as 300 mg/l were not detrimental to the treatment. (Hancuff-Texas)
W71-00124

HIGH-RATE, FINE-MESH SCREENING OF COMBINED WASTE WATER OVERFLOWS,
Cornell, Howland, Hayes, and Merryfield, Corvallis, Oreg.

Donald M. Marske.
Journal of the Water Pollution Control Federation, Vol 42, No 8, p 1476-1494, August 1970. 13 fig, 6 tab, 3 ref.

Descriptors: *Screens, *Waste water treatment, *Sewage treatment, Pilot plants, Storm runoff, Costs, Efficiencies.
Identifiers: *Combined sewage.

Most combined sewers do not have a capacity during heavy storm periods to transport all of the waste and storm water to a treatment facility. This paper reports on (1) the character of the combined waste water overflows, (2) the treatment capability of high-rate, fine-mesh, screens, and (3) comparison of high-rate, fine-mesh, screening to other methods of treating combined waste water overflows. The screen unit produced the best results when operated at an influent flow rate of 1,700 gpm (130 gpm/sq ft) with a 165 mesh stainless steel collar screen rotating at a speed of 60 rpm. The screen unit is capable of treating comparable to a primary clarifier. The screened effluent flow is typically 90% of the influent. The screening unit is an economically feasible method of treating combined waste water overflows. Factors to be considered in the selection of screening are discussed. The estimated construction costs for a 25 mgd screening facility is $496,000. The estimated annual maintainance cost is $18,500. The cost of treatment is estimated at $0.22/1000 gal. (Hancuff-Texas)
W71-00127

A POLLUTION ABATEMENT PROGRAM FOR DISTILLERY WASTES,
American Distilling Co., Pekin, Ill.
R. G. Paulette, C. S. Boruff, and J. O. Nack.
Journal of the Water Pollution Control Federation, Vol 42, No 7, p 1387-1394, July 1970. 6 fig, 2 tab.

Descriptors: *Industrail wastes, *Pollution abatement, *Waste water treatment, *Activated sludge, Sewers, Sewage treatment, Design flow, Aerobic treatment, Nutrients.
Identifiers: *Distillery wastes.

A program of pollution abatement at a distillery is presented. The facility has a capacity for 12,500 bushels of grain per day and operates at 8,500 bushels per day. In the first stage of the pollution abatement program 27 sewers were identified, flows were monitored, and water samples were collected and tested. Sewerage improvements were recommended to separate the process and sanitary wastes. Contaminated water was redirected to seven sewers, to an interceptor sewer and the main row waste pumping station. The treatment efficiency of an activated sludge process was tested against nutrient concentration, mixed liquor suspended solids, unit weight of sludge produced per unit weight of BOD, pH, and temperature. A nutrient supplement would be required to treat the wastes through the aerobic process. An extended aeration plant was recommended in the preliminary report for a number of reasons: (1) It retains a large mass of active organisms to survive long weekend shutdowns, (2) It has the ability to dissipate extremes of pH, temperature and high organic loading, (3) It provides a cooling effect during treatment by the aeration process, (4) It offers greatest economy of installation and operating costs. Based on a 52-hour detention time at average flow, a biological loading of 20 lbs of BOD per thousand cubic feet is provided. Information presented is to provide some of the basic design criteria for other distillery waste plants. (Hancuff-Texas)
W71-00128

PERFORMANCE OF THE SOMERSET, OHIO, OXIDATION DITCH,
Ohio Univ., Athens.
Harry M. Kaneshige.
Journal of the Water Pollution Control Federation, Vol 42, No 7, p 1370-1378, July 1970. 8 fig, 4 tab, 2 ref.

Descriptors: *Performance, Sewage treatment, Lagoons, Waste water treatment, Efficiencies, Ponds, Organic loading, Sludge, Costs, Drying, Activated sludge, Operations, Ohio.
Identifiers: *Oxidation ditch, Suspended solids, Expenses, Somerset (Ohio).

A three year study of the operation of a mechanically aerated oxidation ditch with final settling and sludge return was conducted at Somerset, Ohio. The plant serving about 1,500 people and treating predominantly domestic waste achieved excellent overall removal of suspended solids and BOD. Power consumption was about 1 kwh/cu m or 4 to 5 kwh/kg BOD removed. Power costs were about $20/1000 cu m of flow compared with about $28/1000 cu m for extended aeration plants. Surges and mechanical problems caused reduction in effluent quality but the plant recovered quickly. Extremely cold weather also caused poor performance. Extensive velocity distributions studies were made and several figures are presented illustrating the results. Monthly averages for BOD ranged from 150 to 300 mg/l averaging between 225 and 275 mg/l. Final effluent BOD ranged from 4 to 196 mg/l averaged around 8 to 10 mg/l. (Hancuff-Texas)

IDENTIFICATION AND SURFACTANT DEGRADING ABILITY OF BACTERIA 'STANDARD' SHAKE FLASK INOCULUM,
Army Natick Labs., Mass.
Morris R. Rogers, and Arthur M. Kaplan.
Journal of the Water Pollution Control Federation, Vol 42, No 8, Part I, p R263-R269, August 1970. 1 tab, 20 ref.

Descriptors: *Microorganisms, *Surfactants, *Bacteria, *Degradation (Decomposition), Laboratory tests, Detergents, Cultures, Standards, Activated sludge, Waste treatment, Linear alkylate sulfonates, Detergents, Waste water treatment.
Identifiers: *Identification, Media.

The shake culture presumptive test for measuring the biodegradability of linear alkylate sulfonate (LAS or soft anionic surfactant) used a mixed inoculum originially obtained from an activated sludge waste treatment system. Twenty species of bacteria were isolated from the culture using streak plates of (BBL) nutrient agar, endoagar and tryptone glucose extract agar. The results revealed that the dominant organism is Pseudomonas; in addition Achromabacter cycloclastes, Flavo bacterium, Morexella and Paracolobactrum intermedium were also isolated. Some reservation was employed in naming some of the organisms which did not exactly adhere to the description in Bergey's Manual, but were further classified in accordance with Shewan, Hobbs, Hodgkiss' scheme. Most of these pure culture isolates were found to degrade the standard test LAS surfactant at a rate equal to the standard mixed shake culture inoculum. (Hancuff-Texas)
W71-00131

EFFECT OF NITROLOTIRACETIC ACID ON THE GROWTH AND METABOLISM OF ESTUARINE PHYTOPLANKTON,
Marine Water Quality Lab., West Kingston, R.I.
S. J. Erickson, T. E. Maloney, and J. H. Gentile.
Journal of the Water Pollution Control Federation, Vol 42, No 8, Part II, p R329-R335, August 1970. 7 tab, 13 ref.

Descriptors: *Growth rate, *Metabolism, *Phytoplankton, Estuaries, Chelation, Detergents, Toxicity, Degradation (Decomposition).
Identifiers: *Nitrilotriacetic acid, NTA.

The effects of nitrilotriacetic acid (NTA) on the estuarian phytoplankton was examined in natural and synthetic sea water. NTA is of low toxicity to phytoplankton in the presence of adequate trace metals. The whole molecule is likely to produce trace metals deficiency in sea water at relatively low concentration, 1 to 5 mg/l. NTA is biodegradable by estuarian bacteria, however, phytoplankton were unable to directly metabolize NTA. The time estimated for degradation of NTA to CO2, H2O and inorganic nitrogen compounds has been determined to be one day. Therefore, the residence time within estuaries should be relatively short. The degradation products in sufficient quantity are likely to promote undesirable algal blooms. The NTA molecule when degraded by bacteria loses all chelating capacity and it is unknown whether metals released from degraded NTA chelates will produce toxicity. It is possible that they would either be sufficiently diluted or immediately recomplexed with sea water and create a toxicity problem. (Hancuff-Texas)
W71-00132

THE MATHEMATICS OF ACTIVATED SLUDGE CONTROL,
Brown and Caldwell, San Francisco, Calif.
Warren R. Uhte.
Journal of the Water Pollution Control Federation, Vol 42, No 7, p 1292-1304, July 1970. 1 fig, 1 tab.

Descriptors: *Mathematical model, *Activated sludge, *Control, Sludge, Kinetics, Design.
Identifiers: Suspended solids, Wasting, Computations, Process control.

For the use of the mean cell residence or the solids retention time in the control of an activated sludge system, one must select the desired time, compute the total solids present in the system and determine the total volatile solids to be wasted per day. The solids in the system may be expressed as the sum of those in the aeration facilities secondary sedimentation units and the sludge return system. Solids are wasted both over the effluent weir and through the solids disposal system. Numerical examples show these computations for conventional, step feed, high rate and multiple step operations of an hypothetical plant. Assumed plant design is for a 18 mgd flow. The plant layout includes four aeration tanks, mixed liquor channel and return activated sludge channel, and four secondary sedimentation basins. (Hancuff-Texas)
W71-00133

CANNERY WASTE WATER TREATMENT BY HIGH-RATE SPRAY ON GRASSLAND,
Robert S. Kerr Water Research Center, Ada, Okla.
James P. Law, Jr., Richard E. Thomas, and Leon H. Myers.
Journal of the Water Pollution Control Federation, Vol 42, No 9, p 1681-1631, September 1970. 8 tab, 12 ref.

Descriptors: *Industrial wastes, *Waste water treatment, *Grassland, *Sprays, *Canneries, Irrigation, Efficiencies, Cost, Nitrogen, Phosphorus.
Identifiers: Food processing.

A 12-month survey was conducted to determine the treatment and efficiency of a spray-runoff system for cannery wastes. A total of 133 inches of waste water was applied to each of 4 experimental areas. Hydrological measurements, mass removal efficiencies and soil water quality were evaluated in relation to age of the system, soil type and spray scheduling. Hydrological measurements showed that 18% of the applied water was lost through evaporative process, 61% returned to surface drains as runoff and the remaining 21% percolated through the soil. A normal once-a-day spray schedule resulted in 92% to 99% removal of the volatile solids and oxygen demanding organics, 83 to 90% removal of total nitrogen and 50% to 60% removal of the total phosphorus. The estimated capital cost of installing such a spray runoff system is approximately $1,000 per acre. The system is designed to handle up to 3.6 mgd on approximately 500 acres. Operating costs were estimated at $0.05/1000 gal of waste water treated. (Hancuff-Texas)

CHEMICAL AND ALLIED PRODUCTS (LITERATURE REVIEW),
Water Pollution Control Federation, Washington, D.C.
A. L. Mytelka.
Journal of the Water Pollution Control Federation, Vol 42, No 6, p 1230-1231, June 1970. 11 ref.

Descriptors: *Chemicals, *Industrial wastes, *Waste water treatment, Biological treatment, Oxdation, Ozone, Radiation, Ponds.

The treatment of chemical and allied products received much attention in the literature of 1969. n addition to the traditional biological approach to reatment, the addition of external energy sources uch as chemical oxidants has been reported on a vide variety of wastes. Dilution of the waste water rom coal-tar plants with municipal waste water at a ratio of 1:7 proved satisfactory for biological reatment. It was also determined that phenols hould not exceed 70 mg/l. Bayports industrial omplex contains a central facility to treat wastes rom six industries; they are in general separated nto three categories: clean, biological, and nonacceptable. The use of aerated lagoons and ponds in efinery and chemical waste treatment is described. The reuse of phenolic-resin containing waters in a iberglass plant was determined feasible. Biological reatments were found useful in the clean-up of olyester manufacturing operations and ethylbenzene production. Ozone was used to treat waste treams in a polymer plant as well as waste water rom the production of isoprene. An investigation n the effects of radiation in treating a waste water ontaining cyanides, phenols, petroleum and reated wastes is also discussed. (Hancuff-Texas)

CHEMICAL CONTROL OF TREE ROOTS IN SEWER LINES,
Connecticut Agricultural Experiment Station, Storrs; California Univ., Davis; and California State Dept. of Public Works, Sacramento.
John F. Ahrens, Oliver A. Leonard, and Neal R. Townley.
Journal of the Water Pollution Control Federation, Vol 42, No 9, p 1643-1655, September 1970. 1 fig, 5 tab, 7 ref.

Descriptors: *Sewers, *Control, *Chemicals, Trees, *Plants, Pipelines, Maintenance, Herbicides, Sewage treatment, Costs, Flooding.
Identifiers: *Roots, *Collection systems.

Studies were made of hebicides that would selectively kill tree roots in sewer lines by the flood echnique. Toxicity of herbicides to roots and injury to foliage from root uptake was studied in woody ontainer grown plants first to screen herbicides nd then to determine the factors effecting toxicity n movement of metham and dichlobenil. The latter wo were also tested in sanitary sewers. Solutions of ichlobenil at 100 mg/l killed all the roots except hose of peach exposed for 10 to 60 minutes. Solutions of metham at 5000 mg/l killed most roots exposed for 1 minute or more. In sanitary sewers in acramento a one-hour flood treatment with metham, dichlobenil and combinations of the two illed all roots in the line and most of the roots in joints inspected. Metham also killed roots extending a short distance outside joints. The initial cost f chemical flooding and mechanical root removal were about the same, but chemical flooding is expected to reduce the cost of further sewer maintenance operations. The average cost of power rooting 50 miles of sewer lines was $0.11/ft including all labor, equipment and overhead. The flood method described in this paper was tested on 0,000 feet of 6 inch line. It cost $0.063/ft for hemicals and $0.053/ft for all labor, equipment and overhead. Therefore, a comparable cost of $0.113/ft was determined. (Hancuff-Texas)

SURFACE PROPERTIES AND ION EXCHANGE IN ALGAE REMOVAL,
California Univ., Richmond.
C. G. Golueke, and W. J. Oswald.
Journal of the Water Pollution Control Federation, Vol 42, No 8, Part II, p R304-R314, August 1970. 4 fig, 12 ref.

Descriptors: *Algae, *Harvesting of algae, *Ion exchange, Dissolved solids, Flocculation, Head loss, Hydrogen ion concentration, Chlorella, Scenedesmus, Waste water treatment.
Identifiers: *Surface charge, Regeneration, Suspended solids.

A facet of ion exchange yet to be reported in the literature is the use of ion exchange columns for the removal of cellular material having a surface charge. In experiments on the removal of algae from pond effluent it was found (1) In the presence of either strong or weak cation ion exchange resins, algal cells aggregate into tight clumps and settle in a cone-shaped mass on the top of each resin bead, (2) The aggregated cells are easily removed from the column by backwashing and retain their tendency to aggregate and settle in the displaced backwash, and (3) The exchange efficiency of the resin with respect to algal cells is but a small fraction of that with respect to cations in that the capacity for removing Mg..2, Ca..2, and other cations continues long after the capacity for removing algal cells is exhausted. Aggregation was its strongest within the pH range of 2.8 to 3.5 and dropped off sharply on either side of this range. Concentration of Na.., Ca..2, and Mg..2 from 0.5 to 4.0 millimoles did not affect the precipitation of the cells. Despite the simplicity of the process, the purity of the algal product, and the high quality of the reclaimed water attainable with it, until a regenerant less expensive than H2SO4 or HCl is found, the interest in the process must remain academic rather than economic. (Aguirre-Texas)

RELATIONSHIP OF CHLOROPHYLL A TO ALGAL COUNT AND CLASSIFICATION IN OXIDATION PONDS,
Lamar State Coll. of Technology, Beaumont, Tex.
Joseph V. Dust, and Adam Shindala.
Journal of the Water Pollution Control Federation, Vol 42, No 7, p 1362-1369, July 1970. 7 fig, 7 ref.

Descriptors: *Algae, *Chlorophyll, *Classification, *Oxidation lagoons, Chlorella, Oxygen demand, Photosynthesis, Respiration, Scenedesmus, Waste water treatment.
Identifiers: *Enumeration, Anacystis.

A study was conducted aimed at obtaining a quantitative comparison of chlorophyll A with the total number of organisms in the Trinity River Authority waste water treatment plant as well as a comparison with the various species of algae existing from time to time in these oxidation ponds. The literature indicates that the analytical determination of chlorophyll pigments can be accomplished spectrophotometrically with the following equation: Chlorophyll A in mg/l — (14.3) d665, where d655 is the light absorbance at a wave length of 655 millimicrons and a slit width of 0.3 mm. Eight major types of algae were found in significant numbers: Oocystis, Anacystis, Chlorella, Desmids, Scenedesmus, Coelastrum, Zygnema, and Closterium. The Anacystis organism was found more frequently and in greater numbers than any other organism. The average weekly count of Anacystis varied from about 1 to 4 million per ml during the first 15 weeks of the study comprising the summer and early fall months of the year. Chlorella and Scenedesmus were the predominant organisms during the late fall, winter, and early spring months, with cell counts of 10,000 to 100,000 cells/ml. A relationship between chlorophyll A and total algal count was not found. However, a definite relationship existed between the amount of chlorophyll A and the number of Anacystis organisms present. A similar relationship was found with Zygnema. (Aguirre-Texas)
W71-00139

WATER POLLUTANT OR REUSABLE RESOURCE.

Environmental Science and Technology, Vol 4, No 5, p 380-382, May 1970. 2 fig.

Descriptors: *Waste water treatment, *Industrial wastes, Water resources, Deep wells, Waste disposal, Liquid wastes.
Identifiers: *Steel industry, *Pickling liquor, Recovery, Regeneration.

Spend liquor is an aqueous solution containing from about 0.5 to 10% acid and perhaps 12% iron. Either undissolved or in solution, if discharged untreated to a waterway it is a twofold menace, first for its acid content and second for its iron content. Depending on the chemical and physical form of the iron the liquor may turn the water muddy brown, deposit slime, and exert a strong oxygen demand. Huge amounts of pickling acid, 35 to 40 lbs for every ton of steel are used in the finishing operations. It is estimated that 8 to 15 gallons of spent liquor are produced per ton of steel pickled. Since 50,000,000 tons of steel are pickled every year, spent liquors are produced at a rate of half a billion gallons per year. There are essentially six types of approaches that can be taken for the disposal of spent pickle liquor: (1) discharge to a waterway, (2) deep well disposal, (3) neutralization, (4) hauling by contractor, (5) recovery processes, (6) regeneration processes. The fact that a few of the available recovery and regeneration methods are in actual use in the steel industries seems to be a reflection not so much on the technical uncertainties of these methods but of the fact that much simpler if less effective ways of disposal are still open, consistent to whatever local regulations are in effect. (Hancuff-Texas)
W71-00140

FEASIBILITY OF HYDROLYSIS OF SLUDGE USING LOW PRESSURE STEAM WITH SO-2 AS A HYDROLYTIC ADJUNCT AND UTILIZATION OF THE RESULTING HYDROLYSATE.
Federal Water Pollution Control Administration, Washington, D.C.

Available from NTIS as PB-194 784, $3.00 in paper copy, $0.95 in microfiche. Federal Water Pollution Control Administration Research Series, Report 17070 EKN 12/69, December 1969. 30 p, 5 fig, 9 tab, 10 ref. FWPCA Project 17070 EKN-12/69, Contract No 14-12-188.

Descriptors: *Activated sludge, *Hydrolysis, *Sludge disposal, Proteins, Byproducts, Waste disposal, Chemical reactions, Chemical degradation.
Identifiers: Sludge hydrolysis.

Sulfurous acid, when used with hydrolysis in the treatment of activated sludge, will increase soluble solids, improve filtration efficiencies and reduce moisture content of the resultant filter cake. Use of a 0.5% sulfurous acid and hydrolytic treatment of sludge at 140C for one hour increased the soluble solids content of the activated sludge by 20%. Concentration of the solubilized extract produced a syrup; 85% of the solids content of the syrup was organic. By TKN estimates, over 20% of these solids were proteinaceous. An amino acid analysis indicated it could be of value as an animal feed, and this was confirmed in rat feeding studies (at a 10% level in the diets) showing an efficiency of food utilization of 42 for the organic molasses as compared to 39 for cane molasses. (Knapp-USGS)
W71-00164

ELECTRODIALYSIS OF ESTUARINE WATER,
Metcalf and Eddy, N.Y.
George P. Fulton.
Journal of the American Water Works Association, Vol 62, No 9, p 549-554, September 1970. 6 p, 5 fig, 3 tab, 1 ref.

Descriptors: *Waste water treatment, *Droughts, *Estuaries, *Electrodialysis, *Economics, Municipal water, Water costs, Cost analysis, Water quality, Salinity, Saline water, Water resources development, Cost-benefit analysis.
Identifiers: Estuarine water resources.

The major features of design and operation that should be taken into account when electrodialysis (ED) is considered as a method to supplement existing municipal water supplies with water from river estuary sources are reviewed. What is of paramount importance, in considering a river source that is influenced by tidal action, is the specific location of the electrodialysis plant. Such location will influence both the cost of transmission of treated water to the water supply system, and the cost of the treatment, due to variations in raw water quality. In general, an ED facility must be located along a reach of river where a solids content of above 3,000 mg/liter would occur for only limited periods of time, for both normal and drought conditions. At times of drought conditions, the salt front will move farther upstream than during normal periods. In general, the electrodialysis treatment of estuary sources is a reasonable method for supplementing existing water supplies. Each specific situation where ED may be utilized, however, must be evaluated on its own merits, considering all logic alternative methods of supply. (Knapp-USGS)
W71-00214

MANAGING WASTE HEAT WITH THE WATER COOLING TOWER,
Marley Co., Kansas City, Mo.
Joe Ben Dicky, Jr, and Robert E. Cates.
Marley Company, Kansas City, April 1970. p 14, 9 fig.

Descriptors: *Temperature, *Cooling towers, Heat transfer, Costs, Optimization, Waste water treatment, Water pollution control.

One solution to the problem of stream heating by the electric utility industry lies in the use of water cooling towers. Various operating needs include small unit municipals through syndicates operating multiple units aggregating over 5000 megawatts. Operating conditions include constant on-line recirculating, stand-by or 'trim' duty, and once through systems to limit terminal differences. Types of towers discussed are: larger induced draft, forced and assisted draft, natural draft, and the DriTower. Geographical aspects of design and operating problems are outlined. Accompanying the discussion is a presentation of evaluation factors including methods of selection and optimization of both mechanical and natural draft cooling towers. (Upadhyaya-Vanderbilt)

COOLING TOWERS - A TECHNOLOGICAL TOOL TO INCREASE PLANT SITE POTENTIALS,
Marley Co., Kansas City, Mo.
J. O. Kadel.
American Power Conference, Chicago, April 23, 1970. 15 p, 6 fig, 1 tab.

Descriptors: *Temperature, *Cooling towers, Nuclear powerplant, Evaporation, *Water demand, Waste water treatment.
Identifiers: Fossil fueled plant, Bleed water.

Water demand as related to the water cooling tower system is discussed. For fossil fueled electric generating plants, the waste heat rejected to the cooling water system is on the order of 4,500 BTU per kilowatt-hour of energy generated. A one million kw fossil-fueled plant would require the evaporation of approximately 6,750 gallons of water each minute of operation. A limiting factor for site development is quantity and temperature limits of dependable water supply. The total water demand and proportionate amounts alloted to bleed can readily be compared by examining the curves shown in the paper. Total water demand can vary up to a ratio of 2 to 1 depending on the hardness of the local water. Through careful application of water cooling towers, the power generation potential of plant sites can be increased to a desired level, even if natural water supplies are relatively low. (Upadhyaya-Vanderbilt)

A DISPOSAL SYSTEM FOR AGRICULTURAL WASTE WATERS IN THE SAN JOAQUIN VALLEY OF CALIFORNIA,
Bureau of Reclamation, Sacramento, Calif.
R. J. Pafford, Jr., and Edgar P. Price.
7th Congress on Irrigation Drainage, Quest 26, Rep Disc, R1-R33, p 26.407-26.419, Mexico City, 1969. 13 p, 2 fig, 1 tab, 6 ref.

Descriptors: *Drainage water, Drains, Drainage, Irrigated land, *Waste water disposal, Irrigation effects, Subsurface drainage, Waste water, *Disposal, Return flow, Nutrients, Salinity, Water chemistry, Waste water treatment, Water conveyance, Irrigation, Water pollution, Drainage engineering, Drainage systems, Insecticides.
Identifiers: *San Luis Drain (Calif), San Joaquin Valley (Calif), Open drains, Salt removal, Drainage yield.

Events and conditions leading to the construction of the 188-mi-long San Luis Drain to dispose of agricultural waste water from a large irrigated area on the west side of the San Joaquin Valley in California are described. Estimated amounts of drainage water and chemical concentrations for initial and future operation of the drain are presented. Alternative disposal plans and effects of the waste water on the receiving waters in the Sacramento-San Joaquin Delta and the San Francisco Bay area are discussed. Nitrogen concentration is the principal objectionable feature of the waste water. A 3-yr interagency research program to determine the most economical method for removing nitrate-nitrogen from drainage waters is discussed. (USBR)

A METHOD FOR THE TREATMENT OF ANIMAL WASTES TO CONTROL AMMONIA AND OTHER ODORS,
Vineland Labs., Inc., N.J. Research Div.
William Seltzer, Stanley G. Moum, and Tevis M. Goldhaft.
Poultry Science, Vol 48, No 6, p 1912-1918, November 1969. 4 tab, 10 ref.

Descriptors: *Odor, *Ammonia, *Farm wastes, Air pollution, Poultry, Hogs, Cattle, Bactericides.
Identifiers: Paraformaldehyde, Methogen, Odor control, *Manure odors.

Discusses the use of flaked paraformaldehyde for direct treatment of animal wastes to prevent or eliminate the noxious gases from animal quarters. Paraformaldehyde is a mixture of polyoxymethylene glycols containing 90-99% polymerized formaldehyde. Paraformaldehyde liberates formaldehyde gas as it decomposes. For many years ammonia gas has been used to neutralize formaldehyde gas. This work is predicated on using the principal in reverse. The action of the flake paraformaldehyde on the animal wastes was concluded to be both chemical and antimicrobial and these combined actions make it of value in the control of noxious odors and gases emanating as a result of bacterial fermentation. W71-00332

AN IMPROVED METHOD FOR SEPARATE COLLECTION OF URINE, FECES, AND EXPIRATORY GASES FROM THE MATURE CHICKEN,
Agricultural Research Service, Fargo, N. Dak. Metabolism and Radiation Research Lab.
G. D. Paulson.
Poultry Science, Vol 48, No 4, p 1331-1336, 1969. 3 fig, 7 ref.

Descriptors: *Farm wastes, *Urine, *Poultry, Sampling, Carbon dioxide.
Identifiers: Surgical modification, Poultry urine collection, Metabolism cage.

An improved method for surgical modification of the chicken and collection apparatus to facilitate separate collection of urine and feces is described. There was no mortality from surgery, and the modified birds were normal, as evaluated by outward appearance, feed and water consumption, urine and feces excretion, and post examination of sacrificed birds. A metabolism unit and a system for collecting respiratory CO2 from the chicken are also described. (Miner-Iowa State)

HOUSEFLY LARVAE: BIODEGRADATION OF HEN EXCRETA TO USEFUL PRODUCTS,
Agricultural Research Service, Beltsville, Md.
C. C. Calvert, N. O. Morgan, and R. D. Martin.
Poultry Science, Vol 49, No 2, p 588-590, March 1970. 2 tab, 3 ref.

Descriptors: *Farm wastes, *Livestock, *Manure, *Poultry, Insects, Waste treatment, Ultimate disposal, Waste disposal, Odor.
Identifiers: House fly, Hen, Fly eggs, Manure treatment, Waste utilization.

This report presents the results of experiments to establish the concentration of fly eggs that can be used to process hen excreta most efficiently, and a means of separating the house fly pupae from the processed hen excreta and to simplify their collection. Within four days after seeding with house fly pupae the odor of the manure became unobjectionable. After eight days the excreta was reduced to an essentially odorless and friable material. The separated pupae were utilized as a protein source in the diet of growing chicks. (Miner-Iowa State Univ)

AEROBIC TREATMENT OF LIVESTOCK WASTES,
Illinois Univ., Urbana. Agricultural Experiment Station.
D. D. Jones, D. L. Day, and A. C. Dale.
University of Illinois Agricultural Experiment Station Bulletin 737, 1970. 55 p, 26 fig, 4 tab, 45 ref. HEW Grants EC-00245 and EC-00244.

Descriptors: *Oxidation lagoons, *Aeration, *Farm wastes, *Biochemical oxygen demand, Organic matter, Sludge disposal, Oxygenation, Hogs, Cattle.
Identifiers: *Oxidation ditch, *Aerobic lagoon, Livestock waste properties, Biochemical properties, Aerobic treatment, Irrigation system.

This report emphasizes the aerobic method of storage and treatment of livestock wastes primarily becuase of the low level of odors associated with aerobic treatment. An introduction to the theory of aerobic treatment is presented along with several laboratory experiments on swine, dairy cattle, and

poultry wastes. These laboratory experiments verified the use of the aerobic method for livestock wastes. Two methods of aerobic treatment were studied and the results summarized. These were (A) the in-the-building oxidation ditch and (B) the aerobic lagoon (oxidation pond and aerated lagoon). Recommendations are made as to operator convenience, capacity, and design of the different systems. (White-Iowa State)
W71-00339

EFFECT OF MANURE APPLICATION, AERATION, AND SOIL pH ON SOIL NITROGEN TRANSFORMATIONS AND ON CERTAIN SOIL TEST VALUES,
Wisconsin Univ., Madison. Dept. of Soils.
R. J. Olsen, R. F. Hensler, and O. J. Attoe.
Soil Science Society of America Proceedings, Vol 34, No 2, p 222-225, March-April 1970. 2 fig, 2 tab, 10 ref.

Descriptors: *Nitrification, *Denitrification, *Farm wastes, *Aeration, Soil tests, Rates of application.
Identifiers: N recovery, Field moisture capacity, *Soil nitrogen transformations, Soil pH, Nitrate production.

Nitrate production under aerobic conditions was directly related to rate of manure application, period of incubation and soil pH, but was stopped under anaerobic conditions. Average recovery by chemical analysis of N applied as manure to a Plainfield sand at relatively high rates and incubated for 37 weeks was 77% for aerobic conditions and 24% for anaerobic conditions. The addition of manure tended to increase soil pH and the contents of organic N, available P and exchangeable K, Ca, and Mg, particularly at the higher rates. They also increased the field moisture capacity of a Plainfield sand. However, on an acid Ella loamy sand the two highest rates of manure caused a reduction of the values for field moisture capacity, apparently the result of formation of a waxy material that tended to repel water absorption. (Miner-Iowa State)

LIVESTOCK WASTE MANAGEMENT STUDIES-TERMINATION REPORT,
Illinois Univ., Urbana. Agricultural Experiment Station.
D. L. Day, D. D. Jones, and J. C. Converse.
HEW Project No EC-245. July 1970. 97 p, 75 fig, 14 tab, 7 ref.

Descriptors: *Farm wastes, *Biochemical oxygen demand, *Chemical oxygen demand, *Odor, Hogs.
Identifiers: *Livestock oxidation ditch, Loading rates, Ditch mixed liquor, Optimum aerobic degradation, Aeration rotors, Operating cost, Feeding value of oxidation ditch solids.

This report deals mainly with results from laboratory tests and field trials of oxidation diches. Different loading rates were studied, and solutions to the problem of foaming were discussed. Most of the work was done with swine although laboratory tests were made with beef and dairy animals. Some research was done to determine the feeding value of oxidation ditch solids. The oxygenation capacity of rotors was discussed. A laboratory study of the minimum aeration for odor control was made using set design criteria. (White-Iowa State)
W71-00342

OXIDATION DITCHES CAN ELIMINATE ODORS, MANURE HANDLING AND POLLUTION,
John Russell.
Farm Journal, Vol 94, No 8, p H-10, H-15, August 1970.

Descriptors: *Farm wastes, *Hogs, *Waste treatment, Activated sludge, Odors, Aeration.
Identifiers: *Oxidation ditch, *Hog confinement, Odor control, Smart Pork Farm, Lawrence (Kans).

The use of oxidation ditches is described in a swine confinement system for 5000 head annually near Lawrence, Kansas. Thousand head finishing buildings have two oxidation ditches each with 4 rotors or wheels in each ditch. Organic matter removal is in excess of 90 percent. Operating costs approximate one dollar per head. Effluent is discharged to holding ponds for evaporation thereby eliminating all manure hauling. (Miner-Iowa State)
W71-00343

THE BENEFICIAL USE OF STORM WATER, FINAL REPORT, A SYSTEM STUDY, DESIGN, AND EVALUATION OF THE LOCAL STORAGE, TREATMENT, AND REUSE OF STORM WATER.
Hittman Associates, Inc., Columbia, Md.

Available from NTIS as PB-195 160, $3.00 in paper copy, $0.95 in microfiche. Report No HIT-344, August, 1968. 404 p, 91 tab, 102 fig, 46 ref, 8 append. FWQA Project 11030 DNK 08/68, Contract 14-12-20.

Descriptors: Waste water treatment, *Water reuse, Optimization, *Storm runoff, *Water storage, *Water pollution control, *System analysis, Maryland.
Identifiers: Storm water, Combined sewers, Columbia (Maryland).

This final report covers the work performed by Hittman Associates, Inc. in cooperation with The Rouse Company and the 'new city' of Columbia, Maryland, on the collection, storage, treatment, and reuse of storm water as a means of pollution control and water supply augmentation. A discussio· of the work performed in the analysis and optimization of the system; the conceptual designs of potable, sub-potable, and pollution control systems; the conceptual design of a system for controlling pollution using a 'conventional design' appraoch, the results of the system evaluation and plans for the demonstration of the local storage, treatment, and reuse of storm water. The appendicies to this report include the derivations of the hydrology equations, survey reports on water usage and the public acceptance and legal aspects of reuse, design reports on the 'conventional' and demonstration system, detailed estimates on the cost of the demonstration program, and descriptive information on packaged water treatment plants.
W71-00409

TREATMENT OF WASTE EATER - WASTE OIL MIXTURES.
Armco Steel Corp., Middletown, Ohio.

Available from NTIS as PB-195 161, $0.95 in microfiche. Also for sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402--Price $2.50. 167.13/4; 12010 EZV 02/70. Water Pollution Control Research Series 12010 EZV 02/70, May, 1970. 137 p, 22 tab, 25 fig, 32 ref, 7 append. FWQA Program 12010 EZV, Grant No WPRD-169-01-68.

Descriptors: Waste water treatment, *Industrial wastes, *Emulsions, *Coagulation, Flocculation, *Oil wastes, Flotation, Kinetics, Zeta potential.
Identifiers: *Steel wastes.

Cold reduction of steel strip results in the production of large quantities of waste water containing variable amounts of oil. A five stand tandem cold mill located at Armco Steel Corporation's Ashland, Kentucky Works produces 200 to 500 gpm of waste water containing 400 to 4,000 ppm of oil. The COD of the waste varies from 400 to 20,000 ppm. A treatment process and facility was developed, constructed, and demonstrated, on full scale, for the treatment of cold mill wastes. The treatment process utilized chemical coagulation to break the emulsions. The chemicals employed included alum, lime, clay and organic polyelectrolyte. The process consisted of the following treatment steps; equalization, chemical addition and rapid mixing, flocculation, and dissolved air flotation. A number of treatment variables were studied in the laboratory and in the field in order to establish process kinetics and otpimum treatment efficiency. Zeta potential, streaming current, and particle size distribution were used in laboratory studies to describe the effect of the following variables in process kinetics; acid number, initial oil concentration, type of emulsifier, chemical dosage, order of chemical addition, reaction time, and final pH. Based on these studies, an hypothesis of the emulsion breaking mechanism was proposed. Oil, COD, and turbidity were used in field studies to establish the effect of the following variables on treatment efficiency; chemcial concentration, order of chemical addition, chemical mixing time, flocculation mixing time and speed, and air flotation time and recirculation rate. Based on these studies, design criteria and operating costs for this process were presented.
W71-00410

FEASIBILITY OF A STABILIZATION-RETENTION BASIN IN LAKE ERIE AT CLEVELAND, OHIO.
Havens and Emerson, Cleveland, Ohio.

Available from NTIS as PB-195 083, $3.00 in paper copy, $0.95 in microfiche. Report, May, 1968. 145 p, 22 tab, 34 fig, 38 ref, 3 append. FWQA Project 11020---05/68, Contract No 14-12-27.

Descriptors: Lake Erie, Waste water treatment, *Oxidation lagoons, Ohio, Retention, Water storage, *Settling basins, Costs, Evaluation, Pollution abatement.
Identifiers: Cleveland (Ohio), *Stabilization-retention basins, *Collection systems.

A feasibility study was conducted of a large stabilization-retention basin to constructed in Lake Erie at Cleveland, Ohio. The stabilization is viewed as a possible alternative to separation of a combined sewer system. The proposed basin would treat flows from a number of large combined sewer overflows, from several polluted streams, and effluent from a large secondary wastewater treatment plant. Treatment would consist of bio-oxidation, sedimentation, stabilization and disinfection. A shoreline collection system is included to convey flows to the basin. The chemical, biological, physical and structural aspects of the proposed basin were studied, and the probable benefits to water quality and the effectiveness of the basin as a treatment device were evaluated. Estimates of cost of the basin and collection system were prepared, and it was concluded that the stabilization basin would provide a higher degree of pollution abatement than would separation of sanitary and storm sewers, at about one-third the cost.
W71-00411

STREAM POLLUTION AND ABATEMENT FROM COMBINED SEWER OVERFLOWS - BUCYRUS, OHIO.
Burgess and Niple Ltd., Columbus, Ohio.

Available from the NTIS as PB-195 162, $0.95 in microfiche. Also for sale by the Superintendent of Documents, US Government Printing Office, Washington, DC 20402--Price $2.00. 167.13/4; 11024FNK11/69. Water Pollution Control Research Series 11024 FKN 11/69, November 1969. 197 p, 30 tab, 67 fig, 59 ref. FWQA Project 11024 FKN, Contract No 14-12-401.

Descriptors: Drainage, Hydrographs, Infiltration, *Water pollution control, Interception, Sewers, *Overflow, Urbanization, Ohio, *Pollution abatement, Waste water treatment, Storm runoff.
Identifiers: *Combined sewers, *Interceptor sewers, *Urban runoff, Bucyrus (Ohio), *Sewer overflows.

This report contains the results of a detailed engineering investigation and comprehensive techni-

cal study to evaluate the pollutional effects from combined sewer overflows on the Sandusky River at Bucyrus, Ohio and to evaluate the benefits, economics and feasibility of alternate plans for pollution abatement from the combined sewer overflows. The City of Bucyrus is located near the upper end of the Sandusky River Basin which is tributary to Lake Erie. Bucyrus has an incorporated area of about 2,340 acres, a population of 13,000, and a combined sewer system with an average dry weather waste water flow of 2.2 million gallons per day. A year long detailed sampling and laboratory analysis program was conducted on the combined sewer overflows in which the overflows were measured and sampled at 3 locations comprising 64% of the City's sewered area and the river flow was measured and sampled above and below Bucyrus. The results of the study show that any 20 minute rainfall greater than 0.05 of an inch will produce an overflow. The combined sewers will overflow about 73 times each year discharging an estimated annual volume of 350 million gallons containing 350,000 pounds of BOD and 1,400,000 pounds of suspended solids. The combined sewer overflows had an average BOD of 120 mg/l, suspended solids of 470 mg/l, total coliforms of 11,000,000 per 100 ml and fecal coliforms of 1,600,000 per 100 ml. The BOD concentration of the Sandusky River, immediately downstream from Bucyrus, varied from an average of 6 mg/l during dry weather to a high of 51 mg/l during overflow discharges. The suspended solids varied from an average of 49 mg/l during dry weather to a high of 960 mg/l during overflow discharges. The total coliforms varied from an average of 400,000 per 100 ml during dry weather to a high of 8,800,000 per 100 ml during overflow discharges. Various methods of controlling the pollution from combined sewer overflows are presented along with their degree of protection, advantages, disadvantages and estimates of cost. The methods presented include (1) COMPLETE SEPARATION, (2) interceptor sewer and lagoon system, (3) stream flow augmentation, (4) primary treatment, (5) chlorination, and (6) offstream treatment. It was concluded that the most economical method of providing a high degree of protection to the Sandusky River is by collecting the combined sewer overflows with a large interceptor and using an aerated lagoon system to treat the waste loads from the overflows.
W71-00412

MICROWAVE IRRADIATION OF POTATO WASTE WATER,
Manitoba Univ., Winnipeg. Dept. of Electrical Engineering.
M. A. K. Hamid, W. M. Boerner, and S. C. Tong.
Available from NTIS as AD-711 247, $3.00 in paper copy, $0.95 in microfiche. Journal of Microwave Power, Vol 5, No 1, p 44-46, Feb 1970.
Identifiers: *Water pollution, *Potatoes, *Microwaves, Water pollution, Food, Control, Bacteria, Canada, Potato processing, *Food processing, *Water pollution control equipment, *Microwave sterilization.

Preliminary experiments designed to investigate the sterilization of polluted potato-waste water suggest that microwaves may stimulate the growth of aerobic bacteria, which have a high oxygen demand, and may on the other hand reduce the number of photosynthetic bacteria. These observations have yet to be confirmed with further experimentation as the study continues.
W71-00417

WATER AND SEWER REPORT.
Essex County Planning Board, Belleville, N.J.

Available from NTIS as PB-192 356, $3.00 in paper copy, $0.95 in microfiche. Planners Associates, Inc, Newark, NJ, December 1969. 146 p.
Identifiers: *Management planning, *New Jersey, Economics, *Water suppl)ies, Urban planning, *Sewage, Urban areas, Statistical data, Wastes (Sanitary engineering, Costs, Water pollution, Chlorine compounds, Programming (Computers), Mathematical models, Maps, *Essex County (N J), Area planning and development, Water quality, Water analysis, Sewage treatment.

The report inventories all public and private water and sewer systems in Essex County and the 22 municipalities therein. It then forecasts the 1990 demand for water and sewer services and formulates a plan meeting these demands. The costs for implementing all elements of the recommended plan are included in the capital improvements program.
W71-00420

PRELIMINARY REGIONAL PLAN FOR WATER AND SEWERAGE FACILITIES.
East-West Gateway Coordinating Council, East St. Louis, Ill.

Available from NTIS as PB-192 093, $3.00 in paper copy, $0.95 in microfiche. September 1969. 79 p.
Identifiers: *Sanitary engineering, *Urban areas, *Urban planning, *Missouri, *Management planning, *Illinois, Water supplies, Sewage, Population, Advanced planning, Statistical data, Problem solving, East West Gateway area, *Saint Louis (Missouri), Stormwater.

The report discusses the major water supply, sewage treatment, and storm water problems in the area. Separate sections deal with water supply and an evaluation of water plant capacities, with sewage treatment problems and ratings of treatment plants according to present and future abilities to meet existing standards, and with major storm water problems.

INDUSTRIAL WATER USAGE AND WASTE DISPOSAL IN THE IRON AND STEEL INDUSTRY,
Iscor Works, Vanderbijl Park (South Africa).
S. Erasmus.
Preprint, 1970 Conference of the Institute of Water Pollution Control (Southern African Branch), Cape Town, South Africa, 16-20 March 1970. 9 p, 3 tab.

Descriptors: *Water utilization, *Water reuse, Effluents, Steel, Industrial wastes, Water pollution, Recirculated water, Reclaimed water.
Identifiers: *Iron and Steel Industry, South Africa.

Emphasis is laid on the correct interpretation of the often abused water usage terms like 'consumption' and 'application rate'. Consumption losses in a steel mill amount to 45 to 50% of daily make-up which could probably only be reduced by the introduction of air cooled units. The need for superior quality water for specific applications is emphasized and that the most effective use is based on the cascading and inplant circulating systems. Although recirculation systems are prerequisites for optimum water utilization it does not necessarily decrease consumption use. Such practice often leads to the same weight of pollution in smaller discharges which could result in unacceptable quality effluents. This discourages intensive reuse of water. (Selby-Texas)
W71-00424

PLANNING AND CONSTRUCTION OF WASTE WATER RECLAMATION SCHEMES AS AN INTEGRAL PART OF WATER SUPPLY,
G. J. Stander, and A. J. Clayton.
1970 Conference of the Institute of Water Pollution Control, Cape Town, South Africa (Southern African Branch), March 16-20, 1970. Preprint, 11 p, 2 tab, 4 fig.

Descriptors: *Water consumption, *Water reuse, Effluents, Costs, Waste water treatment, Tertiary treatment.
Identifiers: *South Africa, Internal Reuse.

Statistics presented indicate South Africa is heading for a substantial water shortage on a basis of current usage technology. This forces an acceptance of the fresh water supply, beneficial use and reuse of water, waste water management, and reclamation and the control of pollution are inseparable components in a broad water conservation plan. Reuse of water and reclamation of effluents arising from unit processes in a factory can result in a saving on water consumption of between 50 and 90%. A table compares water requirements of several industries before and after reclamation and reuse. In industrialized urban areas, which account for only about 17% of current daily water usage, 60 to 100% of water intake reaches sewage purification facilities, so it is economically and strategically sound to exploit purified effluents. Predicted water consumption and production patterns are discussed along with the total treatment costs. It will be more advantageous in the future to subsidize local authorities to reclaim their effluents than to develop new water schemes involving the piping of water over long distances. (Selby-Texas)

THE LOCAL GOVERNMENT PRESPECTIVE ON WASTE WATER,
E. J. Hall.
Preprint, 1970 Conference of the Institute of Water Pollution Control (Southern African Branch), Cape Town, South Africa, 16-20 March 1970. 24 p, 4 fig, 3 tab, 12 ref.

Descriptors: *Water Resources, *Political aspects, Local governments, Waste water disposal, Water pollution, Reuse, Waste water treatment.
Identifiers: *South Africa.

By the year 2,000 the water demand in the Republic of South Africa will just about equal the total water supply from all natural sources. But due to geographical distribution of the areas of supply and demand, equitable allocation of all stored water to the demand centers would be impractical. Prime supply as a general rule will be inadequate in developed regions by this time. The dimensions of the problem of waste water control are not fully appreciated even by professional men in local government directly concerned with waste water purification, and there is an urgent need for forward planning. It is of the utmost importance that the State and its departments, which have the ultimate responsibility, should understand in full the dilemma of the local authority. A sympathetic and understanding cooperation between these two levels of government is essential if success is to be achieved. (Selby-Texas)

OBJECTIVES OF WATER POLLUTION CONTROL AND THE PROBLEMS OF THEIR ACHIEVEMENT,
G. Mann.
Preprint, 1970 Conference of the Institute of Water Pollution Control (Southern African Branch), Cape Town, South Africa, 16-20 March 1970. 14 p.

Descriptors: *Water pollution control, *Legislation, Local government, Reuse, Waste water treatment.
Identifiers: *South Africa.

The basis of pollution control treatment as it affects industrial effluents should be one of prevention, and in this respect every endeavor is brought to bear on industrialists local governments, provincial authorities and state departments to make provision for control methods, physical or chemical or both, at their source. Besides control by legislation there are the ethical aspects to be considered as well. Industrialists must also be concerned for the good of South Africa to do all that is in their power

as well as in their interests to exercise the maximum control over water they use, the discharge and disposal of the industrial effluents, and the reuse of purified effluents. (Selby-Texas)

WATER AND WASTE MANAGEMENT IN THE CAPE TOWN METROPOLITAN AREA,
S. S. Morris.
Preprint, 1970 Conference of the Institute of Water Pollution Control (Southern African Branch), Cape Town, South Africa, 16-20 March 1970. 44 p, 19 ref.

Descriptors: *Waste treatment, *Water Resources, Reuse, Waste disposal, Waste water treatment, Water management (Applied).
Identifiers: *South Africa.

The history is reviewed of the development of water and waste management in the Cape Town metropolitan area of South Africa beginning with the occupation of that country by the white races. The country's water supply is discussed including the role of reused sewage and industrial effluents as a water resource. Liquid and solid wastes disposal systems are also discussed including the various pollution investigation and control organizations. (Selby-Texas)

ROTARY VIBRATORY FINE SCREENING OF COMBINED SEWER OVERFLOWS, PRIMARY TREATMENT OF STORM WATER OVERFLOW FROM COMBINED SEWERS BY HIGH-RATE, FINE-MESH SCREENS.
Cornell, Howland, Hayes and Merryfield, Corvallis, Oreg.

Available from NTIS as PB-195 168, $3.00 in paper copy, $0.95 in microfiche. Water Pollution Control Research Series DAST-5, 11023 FDD 03/70, March 1970. 69 p, 19 tab, 24 fig, 3 append. FWQA Program 11023 FDD, Contract 14-12-128.

Descriptors: *Screens, *Overflow, *Sewage treatment, Waste water treatment, Storm runoff, Cost analysis, Evaluation, Cost comparisons, Treatment facilities.
Identifiers: *Rotary screens, *Combined sewers, Sewer overflows.

The objective of this study was to determine the feasibility, effectiveness, and economics of employing high-rate, fine-mesh screening for primary treatment of storm water overflow from combined sewer systems. The final form of the screening unit stands 63 inches high and has an outside diameter of 80 inches. The unit is fed by an 8-inch pipe carrying 1700 gpm (122 gal/min/ft2) which is distributed to a 60-inch diameter rotating (60 rpm) stainless collar screen having 14 square feet of available screen area and a 165 mesh (105 micron opening, 47.1 percent open area). The screen backwashed at the rate of 0.235 gallons of backwash water per 1000 gallons of applied sewage. Based on final performance tests run on dry-weather sewage, the unit is capable of 99 percent removal of floatable and settleable solids, 34 percent removal of total suspended solids and 27 percent removal of COD. The screened effluent is typically 92 percent of the influent flow. On the basis of a scale-up design of a 25 mgd screening facility, the estimated cost of treatment is 22 cents/1000 gallons. No finite cost comparisons were made with other treatment methods; however, when compared to conventional primary sedimentation, the selection of a screening facility as a treatment method is dependent on the value and availability of land, the design capacity of the treatment facility, the character of rainfall and runoff, and the available means of disinfection. It was observed that the proposed screening facility required 1/10 to 1/20 the land required by a conventional primary treatment plant.

PRELIMINARY WASTE WATER REPORT FOR THE OUTER AREA.
Northeastern Illinois Planning Commission, Chicago.

Financed in part with a planning grant from the HUD under Section 701 of the Housing Act of 1954. July 1970. 208 p, 37 fig, 48 tab, 146 ref.

Descriptors: *Waste water treatment, *Waste water, *Water quality control, *Water management, *Water pollution, *Illinois, *Water pollution control, *Water quality act, *Regional analysis, *Planning, *Urbanization, *Local governments, *Treatment facilities, Waste water pollution, Industrial wastes, Sewers, Municipal wastes, Construction costs, Evaluation, Analysis.
Identifiers: *Northeastern Illinois, Metropolitan planning, Agricultural wastes, Physiography, Comprehensive plan.

This preliminary report presents information on existing waste water treatment facilities in four of the six counties comprizing the Northeastern Illinois Metropolitan Area. It also summarizes the estimated future requirements and costs for waste water treatment in each county to the year 2,005. The counties include all of McHenry, Kane and Will counties and that portion of Lake County that is not served by the North Shore Sanitary District. Statistical and technical data are presented on each county to describe population trends and estimates, land use, topography, drainage, water supply, climate, and exisiting waste water disposal facilities, problems and alternative solutions. In some cases, proposed solutions involve the creation of a county public works department or county public health department to acquire, improve, construct and operate county treatment facilities or to provide advisory service to independently operated facilities. Other solutions, involving subregional or district waste water agencies and continuation of operations of existing plants by individual municipalities and industrial plants, are also evaluated. The relationship of these possible solutions to the comprehensive general plan of the entire region is discussed. The appendix includes the Illinois Water Quality Standards and sections on animal wastes and nutrients. The publication is intended for review purposes and is not considered to be in its final form. (See also W71-00486) (Poertner)
W71-00485

PRELIMINARY WASTE WATER PLAN FOR THE INNER AREA; SUPPLEMENT NO. 1, RECOMMENDED PLAN FOR DUPAGE COUNTY.
Northeastern Illinois Planning Commission, Chicago.

Financed in part with planning grant from the HUD under Section 701 of Housing Act of 1954. July 1969. 74 p, 11 fig, 10 tab, 11 ref.

Descriptors: *Waste water treatment, *Evaluation, *Analysis, *Waste water, *Water quality, *Water management, *Water pollution, *Illinois, *Water pollution control, *Urbanization, *Planning, *Treatment facilities, *Local governments, Sewers, Municipal wastes, Waste water pollution.
Identifiers: *Northeastern Illinois, *DuPage County, Metropolitan planning, Comprehensive plan.

Four proposed plans are analyzed for providing waste water treatment and disposal facilities to meet the increasing needs of DuPage County, the most rapidly growing county in Illinois. It lies immediately west of Cook County. The factors that are considered in the analyses and comparisons illustrate thoughtful and far reaching evaluation of alternatives. The study exemplifies some philosophies that should be considered by those planning the waste water facilities for other rapidly growing counties. Two of the proposed systems included a single treatment plant together with extensive systems of large diameter interceptor sewers. Another plan proposed eight treatment plants, and another proposed eleven. Each of the latter two systems involved less extensive systems of smaller diameter interceptor sewers. In addition to capital, operating and maintenance costs, the comparisons included consideration of water reuse, the loss of flood plain storage to urbanization when sewers are provided, the relationship of proposed sewer routes to existing mass transportation routes, the potentials for staged construction, urgan drainage potentials, relationships of existing forest preserves, opportunities for open space acquisitions, and financing, administrative and management opportunities and problems. The eight plant system, under County management, was recommended. This publication is intended for review purposes. (See also W71-00485) (Poertner)

5E. Ultimate Disposal of Wastes

DISPOSAL OF RADIOACTIVE WASTES FROM U. S. NAVAL NUCLEAR-POWERED SHIPS AND THEIR SUPPORT FACILITIES, 1969,
Naval Ship Systems Command, Washington, D.C.
J. J. Mangeno, and M. E. Miles.
Radiological Health Data and Reports, Vol 11, No 8, p 373-377, August 1970. 5 p, 3 tab, 9 ref.

Descriptors: *Radioactive waste disposal, *Ships, *Nuclear wastes, *Monitoring, *Harbors, Nuclear reactors, Water pollution sources, Water pollution control.
Identifiers: Nuclear-powered ships, U. S. Navy.

This report summarizes data on disposal of radioactive wastes from U. S. Naval nuclear-powered ships and their support facilities and summarizes results of environmental monitoring performed to confirm adequacy of waste disposal limits and procedures. The total long-lived radioactivity in liquid waste discharges associated with operation and maintenance of Naval nuclear-powered ships totaled 0.05 curies in 1969 for all harbors. This is comparable to the average of 0.2 curies discharged per year during the preceding 3 years for all harbors and is less than the average of 4 curies reported discharged per year during the preceding 5 years. No increase in radioactivity above normal background levels has been detected in harbor water. Discharges of liquid wastes from U. S. Naval nuclear-powered ships have not caused a measurable increase in the general background radioactivity of the environment. Low-level cobalt-60 radioactivity is detectable in localized areas of harbor bottom sediment around a few piers at operating bases and shipyards where maintenance and overhaul of Naval nuclear-powered ships have been conducted over a period of several years. (Knapp-USGS)

DEEP-WELL INJECTION (LITERATURE REVIEW),
Water Pollution Control Federation, Washington, D.C.
T. J. Tofflemire.
Journal of the Water Pollution Control Federation, Vol 42, No 6, p 1231-1235, June 1970. 35 ref.

Descriptors: *Industrial wastes, *Deep-wells, *Injection wells, Wells, Waste water treatment, Waste disposal, Geology.

The use of deep wells for disposal of industrial waste has grown rapidly over the last 20 years. In

1950 there were many salt-brine disposal wells but only a few disposal wells for industrial wastes. In 1967 there were 40,000 salt-brine disposal wells and 110 wells for other wastes. It is suggested that in some cases deep-well injection has achieved a complete solution to the pollution problem and 100% BOD removal. A discussion of the legal implications, legislation and regulations of deep-well injection is discussed. Geological considerations are discussed from the standpoint of isolating the waste from fresh groundwater and from other natural resources such as gas, oil and coal. Abandoned wells, faults, and geological conditions must be considered when planning a disposal well site. It is also necessary to consider earthquake activity when planning a deep-well. It is conceivable that under certain conditions an improperly located deep-well might trigger an earthquake. Technical considerations such as operational problems from clogging and corrsion are mentioned. Numerous case histories are discussed from several industries which utilize deep-well injection disposal methods. (Hancuff-Texas)

FEEDING VALUE OF CATTLE MANURE FOR CATTLE,
Auburn Univ., Ala. Dept. of Animal Science.
W. Brady Anthony.
Journal of Animal Science, Vol 30, No 2, p 274-277, 1970. 6 tab, 14 ref.

Descriptors: *Farm wastes, *Manure, Cattle, Feeds, Reuse.
Identifiers: *Cattle manure, Manure feeding, Manure utilization, Feed supplement.

The objectives were to reappraise the feeding of manure-containing rations to fattening cattle and determine if cooking the manure improved it's feeding value. Rations containing wet cattle manure were readily consumed by fattening steers and these rations supported gain essentially equal to comparable cattle fed feeds without manure. Cooking or washing manure before mixing it with concentrate for feeding did not improve its feeding value. Carcass data were similar for manure-fed and other cattle. Wet manure collected daily per yearling steer was about 13.5 kg. (3.12 kg. dry matter) and about 6.6 kg. (1.52 kg. dry matter) was consumed daily. The digestibility data do not clearly indicate effective use of either manure energy or manure crude protein. However the data show that manure did not impair digestibility and actually saved concentrate dry matter used per unit of gain. This indirect evidence strongly suggests that manure was utilized to an appreciable degree for productive purposes. Feeding manure with concentrate did not completely alleviate waste disposal problems. Only about one-half of the manure collected daily was fed. The remainder of the daily excretion had to be disposed of elsewhere. (Miner-Iowa State)

DEEP-SEA DISPOSAL OF LIQUID AND SOLID WASTES,
Dillingham Environmental Co., Honolulu, Hawaii.
David D. Smith, and Robert P. Brown.
Industrial Water Engineering, Vol 7, No 9, p 20-24, September 1970. 5 p, 1 fig, 1 tab, 5 ref.

Descriptors: *Waste disposal, *Industrial wastes, *Solid wastes, *Radioactive waste disposal, *Oceans, Sludge disposal, Poisons, Explosives, Acids.
Identifiers: Waste disposal sites (Oceans).

The current status of oceanic disposal of liquid and solid wastes from 20 U.S. cities is summarized. In 1968, 48 million tons were disposed of at sea at an estimated cost of $29 million. About 120 disposal areas were identified. (Knapp-USGS)
W71-00349

MARINE DISPOSAL OF PETROLEUM REFINERY EFFLUENTS,
B. F. Steere.
Preprint, 1970 Conference of the Institute of Water Pollution Control (Southern African Branch), Cape Town, South Africa, 16-20 March 1970. 9 p, 7 fig, 5 ref.

Descriptors: *Oil wastes, *Oily water, *Disposal, *Sea water, Ocean currents, Surge tank, Retention, Industrial wastes.
Identifiers: South Africa, Oil separator.

Following the erection of an oil refinery on the South African coast, a system was designed for effluent treatment and disposal. Oily effluent water was passed through an oil separator with surge and retention basins, and then discharged by pipeline into the bay, at least 1,500 feet beyond the high water mark. A diffuser at the end of the line was to ensure adequate dispersion and dilution of the effluent with sea water and also prevent filting of the orifices. The design and operation of the system has proven successful. The system is capable of reducing undesirable constituents in the effluent, and of dispensing it in the sea, to the extent that little or no effect is noticeable on the environment. No complaints have been received from the public. (Selby-Texas)

PRELIMINARY REPORT ON GEOHYDROLOGIC EXPLORATION FOR DEEP WELL DISPOSAL OF EFFLUENT, WAIMANALO SEWAGE TREATMENT PLANT, OAHU,
Hawaii State Dept. of Land and Natural Resources, Honolulu. Div. of Water and Land Development.
Daniel Lum.
Department of the Land and Natural Resources, Circular C 54. 14 p, 6 fig, 1 tab.

Descriptors: *Effluents, *Sewage disposal, *Deep wells, Hydrology, Costs, Injection, Discharge measurement, Hawaii, Hydrogeology, *Exploration.

Because of a high estimated cost of constructing an ocean outfall sewage effluent disposal system, the Hawaiian Department of Land and Natural Resources decided to investigate effluent disposal utilizing deep wells. The various geohydrologic investigations were completed over a three-year period in three phases. First, a preliminary injection test utilizing an existing non-used well. Second, subsurface geohydrologic exploration consisting of drilling, coring, and testing eight Nx-size test holes. Depths varied from 50 to 450 feet and a total of 2,200 feet of core drilling and hydrologic testing were accomplished. Third, drilling and testing of three-15 inch diameter disposal wells within the sewage treatment plant site. Test results show that the three 15-inch disposal wells have a minimum capacity of 14.0 MGD (million gallons per day), compared to the present 1.1 MGD and the ultimate 2.2 MGD EFFLUENT FLOW DESIGNED FOR THE Waimanalo sewage treatment plant. Also, the 14.0 MGD capacity of the wells is twice the 7.0 MGD design peak flow of the treatment plant. (Selby-Texas)

5F. Water Treatment and Quality Alteration

HYDROBIOLOGICAL PROPSPECTIVES OF THE MEURTHE: MINERAL POLLUTION AND ALGAL VEGETATIONS (IN FRENCH),
Laboratoire de Biologie Vegetale, Nancy (France).
Jean-Francois Pierre.
Comptes Rendus Academie des Sciences, Paris, Vol 270, No 17, Serie D, p 2101-2102, 1970. 3 ref.

Descriptors: *Water treatment, *Chlorination, *Algal control, Rivers, Water pollution effects, Algae, Diatoms.
Identifiers: Rhine-Maas Basin (France), Meurthe River (France), Cladophora, Phormidium, Oscillatoria, Oedogonium.

One of the flowing cultures contained water of the River Meurthe with chlorine ion concentration in the proximity of 37 milligram/liter. In another culture the concentration of chlorine was increased to 760 milligram/liter. Inocula included Cladophora glomerata, Oedogonium spp, Phormidium tenue, Oscillatoria spp, and numerous diatoms. The increased concentration of chlorine failed to influence significantly the algal population thus demonstrating considerable ecological plasticity of these organisms. The results suggested that the concentration of 800 milligram/liter of chlorine ions in the River Meurthe would not produce a harmful suppression of algal growth. (Wilde-Wisconsin)

BEVERLY HILLS WATER DEPARTMENT SOLVES ALGAE PROBLEM WITH KMnO-sub-4,
Beverly Hills Municipal Water Dept., Calif.
Mary Jo Witt.
Water and Sewage Works, Vol 115, p 400-403, 1968. 2 fig, 6 photos.

Descriptors: *Potable water, *Water quality control, *Algae, Copper sulfate, Chlorine, Wells, California.
Identifiers: *Potassium permanganate, Beverly Hills (Calif).

Beverly Hills (California) operates two lime softening and filtration plants for their well water. Plants No 1 and No 2 treat an average of 5.5 mgd and 2.5 mgd, respectively. In March 1963, a 900,000 gal sedimentation basin in Plant No 1 was replaced by a 250,000 gal basin. Copper sulfate and chlorine had controlled algae and bacterial growths in the old basin but converted algae and bacteria to a greenish-black tar-like scum in the new basin. In July 1964, a 1.8 milligram/liter dose of potassium permanganate was added to the basin along with chlorine and copper sulfate resulting in noticeable improvement within a day or so; continued treatment eliminated the growth. For maximum contact, potassium permanganate was fed into the pump discharge line at the furthest well. Since starting potassium permanganate treatment, copper sulfate application was eliminated; shutdowns for clean-out are necessary only every 9-12 months, and there is practically no algae in the settling basin. During the summer and fall large pieces of algae would break loose from the clarifier and basin walls in Plant No 2. In October 1965, a 1.2-1.5 milligram/liter continuing dose of potassium permanganate, fed to the well farthest from the plant, freed the growth from the basin walls. (Haskings-Wisconsin)

DIATOMITE FILTRATION SLUDGE DISPOSAL (SUBCOMMITTEE PROGRESS REPORT),
American Water Works Association, New York. Water Quality Div.
E. R. Baumann, J. Stewart Brown, and Charles H. Lawrence.
Journal of the American Water Works Association, Vol 62, No 8, p 507-509. 1 tab.

escriptors: *Sludge, *Waster treatment, *Filtra-on, *Diatonacious earth, Lagoons, Dewatering ewage disposal, Chemicals.
dentifiers: Solids, Reuse, Land disposal.

here is even less published information on prac-ces with disposal of diatomite filtration plant astes than with conventional filtration plant rocess wastes. For filtration wastes the chief vailable experience has been with settling lagoons hich have been more or less for diatomite treat-ent plants. It is hoped that the plant survey cur-ntly being conducted will reveal additional infor-ation about existing plants. It is hoped that ssistance will be available from other organiza-ons. In general it appears that the overall mag-itude of the problems for disposal of process astes from water filtration by diatomite and by onventional facilities are quite close. Each has its wn inherent advantages and disadvantages. iatomite filtration involved substantially less total olumn of liquid waste than does conventional. For w turbidity applications which are those normally hosen for diatomite treatment the total dry solids asted may not be much greater, if at all, than that roduced by coagulation sludge from a conven-onal filtration plant of the same through put. The orosity of diatomite wastes make for relatively asy dewatering, however, the abbrasive nature of he filter aid may make handling difficult. (Han-uff-Texas)

IIGH-RATE FILTER EFFICIENCY,
Contra Costa County Waste District, Calif.
V. Leslie Harris.
ournal of the American Water Works Association, Vol 62, No 8, p 515-519, August 1970. 2 fig, 2 tab, ref.

Descriptors: *Filtration, *Water treatment, Operations, Filters, Water quality, Head-loss.
dentifiers: Loading, Backwash, Conditioning.

An experimental programme made prior to the onstruction of a new water treatment plant for the Contra Costa County District indicated that the easibility of upping the capacity of filtration some 0% from 6 to 10 gpm/sq ft while applying a water f higher turbidity to the filters. When the plant as constructed in May 1968 it demonstrated an fficiency three times that of the former main plant ith dual media filters and nearly 8 times the effi-iency of the same plant back in the days of straight and filtration. In the course of more than 400 runs ith an experimental filter it was found that a con-itioned filter accepted surges without passage of reviously deposited material. A filter may be con-itioned to augment straining through the addition f small amounts of a polymer to the backwash ater during the backflow time. Conditioning was eveloped using anthracite sand filters which also nabled longer runs at higher rates. Experimental ork also indicated that a substantial air lift in-roduced just above the expanded bed removed ines which otherwise remained above the lifted ed. Garnet, a fine heavy material, was eliminated ecause of some hazard of its downward migration o the supporting gravel and its tendency to result n the fountain effect when localized high flows oc-curred. (Hancuff-Texas)

WATER AND HEALTH--ARE WE CONCERNED ENOUGH,
Pennsylvania Dept. of Health, Harrisburg. Div. of Sanitary Engineering.
Walter A. Lyon.
In: Water Resources Bulletin, Vol 6, No 1, Februa-ry 1970, p 72-77. 12 ref.

Descriptors: *Water quality control, *Public health, *Water pollution, *Water pollution sources, Pesticide residues, Viruses, Chemicals, Legal aspects, Public rights, Social aspects, En-vironmental effects, Attitudes.
Identifiers: *Environmental policy.

From an historical point of view, man's concern about the health and protection of water supply is the history of the dramatic reduction in acute communicable diseases due to water-borne micro-organisms. Now that these have been essentially eliminated, there has been a great reduction in concern by scientists and the medical profession with the health aspects of contaminated water. This, in spite of the fact that many concerned people and national advisory groups have reminded us that an increasing number of possible chemical and other hazards find their way into our water supplies and expose human populations to contaminants at low concentration levels without reliable knowledge as to their health effects. Too little research is being done on the health effects of chemicals, pesticides, and viruses. The fact that large populations are being exposed to these possible hazards raises legal and public policy questions. Persons who are largely ignorant of the possible harm of these substances are being exposed to them without consent. Often low level exposure to environmental contaminants is not known or not discovered until considerable time has passed. This raises the question concerning the burden which should be imposed on industry and others who introduce new substances in the environment. The best approach in solving this problem is to prohibit the new substance from being introduced into the environment until it has been shown by reliable studies that even low level exposure is not likely to harm human health. CLEAN WATER FOR THE 1970'S--A STATUS REPORT.
Federal Water Quality Administration, Washington, D.C.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402 Price $1.50. Federal Water Quality Administration Status Report, June 1970. 80 p.

Descriptors: *Water pollution control, *Water quality control, *Water quality act, Legislation, Water law, Quality control, Abatement, Governments, Water quality.
Identifiers: Federal Water Quality Administration.

Since 1966, the primary responsibility for carrying out the Federal programs in water pollution has rested with the Federal Water Pollution Control Administration. Passage of the Water Quality Improvement Act of 1970 resulted in a new name for the agency, the Federal Water Quality Administration (FWQA), which stresses the more positive aspects of the program. The purpose of this first annual progress report is to provide a groundwork for understanding the nature of the Federal and State water pollution control programs, to detail the progress which has been made during the first year of the Nixon Administration, and to assess the measures which will be required to fulfill the challenge of the 1970's. An important part of this assessment is the impact of significant new water pollution control legislation. (Knapp-USGS)

WATER SUPPLY AND WATER POLLUTION CONTROL-APPENDIX D TO REPORT FOR DEVELOPMENT OF WATER RESOURCES IN APPALACHIA.
Federal Water Quality Administration, Cincinnati, Ohio. Ohio Basin Region.

Report on Development of Water Resources in Appalachia published in 25 Volumes. Federal Water Pollution Control Administration Report, Vol 19 of 25 Vol, Append D, March 1969. 379 p.

Descriptors: *Water supply, *Water pollution control, *Water resources development, *Appalachian Mountain region, Water pollution sources, Water pollution treatment, Waste water disposal, Industrial wastes, Acid mine water, Water utilization, Surface waters, Groundwater.
Identifiers: Appalachian redevelopment.

Appendix D, 'Water Supply and Water Pollution Control' of the Report for Development of Water Resources in Appalachia furnishes information on water supply and water pollution control needs in and adjacent to the Appalachian region. Included are a general appraisal of present and future water supply and water pollution control needs, and the ways and means of satisfying these needs. The appendix also includes detailed discussions of water supply and water quality control needs that can be satisfied from selected reservoir projects that are proposed for inclusion in the Appalachian Plan for

Water Resources Development. An index for the entire report with its 9 appendices is included. (Knapp-USGS)

STEAM INJECTION, OIL RECOVERY TECHNIQUES, AND WATER QUALITY,
Orange County Water Pollution Control Dept., Santa Ana, Calif.; and Orange County Flood Control District, Santa Ana, Calif.
J. C. Roberts, and J. W. Williams.
Journal of the Water Pollution Control Federation, Vol 42, No 8, Part 1, p 1437-1445, August 1970. 9 p, 3 fig, 1 tab, 6 ref.

Descriptors: *Oil fields, *Injection wells, *Secondary recovery (Oil), *Steam, *Water quality, Water pollution effects, Water pollution sources, Flooding, Injection, Oil reservoirs, Groundwater.
Identifiers: Well tests, Steam injection.

Steam is injected into oil wells to decrease oil viscosity and improve production rates and ultimate recovery. The effect of steam injection on oil zone waters is not well known. A survey of steaming practices in the Yorba Linda Field in California was made. Extensive tests were run on a number of parameters for a shallow-zone well, and it was concluded that the water being produced was representative of the groundwater in that zone. Except for silica concentration, steaming does not seem to affect water quality in the shallow zone of the Yorba Linda Field. (Knapp-USGS)

PHYSICAL DATA OF POTOMAC RIVER TIDAL SYSTEM INCLUDING MATHEMATICAL MODEL SEGMENTATION,
Federal Water Quality Administration, Annapolis, Md. Chesapeake Technical Support Lab.
Norbert A. Jaworski, and Leo J. Clark.
Chesapeake Technical Support Laboratory Technical Report No 43, Federal Water Pollution Control Administration, 1970. 49 p, 9 fig, 15 tab.

Descriptors: *Estuaries, *Data collections, *Hydrologic data, *Water pollution sources, *Virginia, Maryland, District of Columbia, Tides, Channel morphology, Model studies, Streamflow, Mathematical models, Depth, Cross-sections, Profiles.
Identifiers: Potomac Estuary.

In water quality studies of the Potomac, the Chesapeake Technical Support Laboratory (CTSL) collected data on the physical characteristics of the estuary. Factors of major importance are: surface and cross-sectional areas, volumes, and distances between bridges, buoys, prominant landmarks and other reference points. This is not only essential for mathematical modeling studies but also to interpret field survey information. The tidal portion is several hundred feet in width at its head at Washington and broadens to nearly six miles at its mouth. A shipping channel with a minimum depth of 24 feet is maintained upstream to Washington. Except for this channel and a few short reaches where depths up to 100 feet can be found, the tidal portion is relatively shallow with an average depth of about 18 feet. The mean tidal range is about 2.9 feet in the upper portion near Washington and about 1.4 feet near the Chesapeake Bay. The lag time for the tidal phase between Washington and the Chesapeake Bay is about 6.5 hours. Effluents from twelve major waste water treatment plants, with a thirteenth under construction, serving a population of about 2,500,000, are discharged into the upper tidal system. The locations of the discharges from these treatment facilities are shown. (Knapp-USGS)

WATER AND SEWERAGE STUDY, SECOND PHASE.
Morris County Planning Board, Morristown, N.J.

Available from NTIS as PB-193 081, $3.00 in paper copy, $0.95 in microfiche. Elson T. Killam Assoc., Millburn, N.J. May 1970. 74 p.
Identifiers: *Urban planning, *New Jersey, *Water supplies, Urban planning, *Sanitary engineering, Urban planning, Water pollution, Control, Drainage, Water resources, Groundwater, *Sewers, *Regional planning and development, *Waste treatment, *Waste treatment facilities, *Watersheds, *Morris County (New Jersey).

At the present time practically all the Public Water Purveyors within the County derive their water supply from wells, with the greatest concentration of use being in the Central and Eastern portions of the County. Other water supply sources will be required, necessitating the development of surface supplies. The supplies and transmission facilities being developed by the Morris County Municipal Utilities Authority are discussed. Adequate sewerage facilities and treatment facilities needed in the future are discussed.
W71-00435

A MASTER SEWERAGE PLAN FOR UNION COUNTY, NEW JERSEY.
Union County Planning Board, N.J.

Elson T. Killam Assoc. Millburn, N.J., April 1970. 83 p.
Identifiers: *Roads, Sand, *Structures, Drainage, Interactions, Shear stresses, Pipes, Deflection, Compressive properties, Strain (Mechanics), Flexible structures, Mathematical models, Ohio, *Culverts, Soil stabilization.

The report presents a Master Sewage Plan for Union County, New Jersey. It includes the analysis of existing facilities, as presented in the First Stage Report, entitled, 'Sanitary Sewerage Facilities in Union County'. This report analyzes by comparing their capacity to present and projected sewage flows and the New Jersey State Department of Health Standards.
W71-00436

RICHMOND REGIONAL SEWERAGE PLAN AREA WIDE PLAN FOR LONG RANGE DEVELOPMENT.
Richmond Regional Planning District Commission, Va.

Available from NTIS as PB-192 437, $3.00 in paper copy, $0.95 in microfiche. McGaughy, Marshall and McMillan, April 1970. 57 p.
Identifiers: *Urban areas, Sewage, *Sewage, *Management planning, Sanitary engineering, Disposal, Volume, Pipes, Fluid flow, Virginia, *Regional planning, Development, Richmond (Virginia), Sewage treatment.

The Sewage Plan is an areawide plan for long range development of sewage systems. The Plan provides for coordination and cooperation between political subdivisions and private firms involved in fulfilling the present and future sewer requirements for the area: The basic framework is included for: Waste water collection and treatment systems; The areas

to be served and the general capacities and requirements of the system. The plan provides for the development of a unified coordinated system capable of providing for future growth of the regional population while considering economic forecasts and land use plans. (See also W71-00446)

WATER AND SEWER PLAN FOR THE TUSCALOOSA METROPLITAN AREA.
Tuscaloosa Area Council of Local Governments, Ala.

Available from NTIS as PB-191 340, $3.00 in paper copy, $0.95 in microfiche. Rust Engineering Co., Birmingham, May 1969. 56 p.
Identifiers: *Urban planning, *Alabama, *Water supplies, *Sanitary engineering, Urban areas, Population, Costs, Construction, Management planning, Area planning, Development, *Tuscaloosa (Alabama).

Contents: Population of Tuscaloosa County; Physical features and natural resources; Existing water and sewer facilities in Tuscaloosa County; Future water improvements; Future sewerage improvements; and Costs of water and sewer improvements.
W71-00459

FACTORS IN TECHNOLOGY TRANSFER: THE CASE OF CORNING PYREX ACID-WASTE DRAINLINE,
Syracuse Univ., N.Y.
E. B. Fredrikson, and E. W. Lawson.

Available fron NTIS as N70-21116, $3.00 in paper copy, $0.95 in microfiche. Occasional Paper No. 1, July 1969. 15 p.
Identifiers: *Borosilicate, Technology utilization, Budgeting, Industry, Manufacturing, Transfer functions.

A technology transfer analysis is presented, consisting of two major factors: (1) a combination of tedious development work, an imaginative individual, and luck; and (2) a well planned marketing program. The case of the chemical and heat resistant acid waste drainline is used as an example. The development process, choice of materials, subsequent product improvements, and marketing of the drainline are described.

Water Pollution Control Research Series - 11024 DMS 05/70 May 1970. 250 p, 60 tab, 101 fig, 10 plates, 21 ref. FWQA Program 11024DMS, Contract No. 14-12-200.

Descriptors: *Sewers, *Infiltration, *Overflow, *Water pollution control, Surveys Computer programs, Storm runoff, Flow measurement, Sewers, Rainfall-runoff relationships, Sampling, Construction costs.
Identifiers: Sewer infiltration, Sanitary sewers.

Results are given of investigations, on 25 percent of Roanoke, Virginia's separate sanitary sewerage system, on the amounts of infiltration for various storm intensities and durations and the amounts of sewage overflow from the system, From these results the system was analyzed, using an in-house developed computer program, to assess the magnitudes and frequencies of overflows. The generated data from the analysis were used to develop an optimum design for remedial measures to reduce sewer overflows. Costs estimates are presented for the various items of work involved.
W71-00478

PROPOSED COMBINED SEWER CONTROL BY ELECTRODE POTENTIAL.
Merrimack Coll., North Andover, Mass.

Available from NTIS as PB-195 169, $3.00 in paper copy, $0.95 in microfiche. Water Pollution Control Research Series 11024 DOK 02/70, Feb. 1970. 69 p, 10 tab, 20 fig, 38 ref. FWQA Project 11024 DOK, Contract No. 217-01-68.

Descriptors: *Electrodes, *Flow control, *Flow rates, Sewage, Outlets, Water pollution control, Overflow, Dissolved oxygen, Pollution abatement, Storm runoff.
Identifiers: *Combined sewers, *Electrode potential, *Sewage overflows, Sewer outfalls.

The effectiveness was investigated of electrode potential measurements to modulate discharges from comvined and storm sewer overflows to reduce stream and estuarine pollution. Studies included varying the composition of sewage, flow rate and examining the tendency to polarize or coat the electrodes under actual flow conditions. The analysis of experimental results shows a high degree of correlation between the electrode potential of the sewage and its strength. Linear correlation coefficients between electrode potential were determined for BOD, COD, Sulfides, total phosphorus, nitrates, and chlorides. It was demonstrated that the potential will be more negative the greater the S— concentration, except when a small amount of DO is present which exerts an attenuating influence. Flows carrying substantial concentrations of reducing substances with a detrimental impact on the dissolved oxygen reservoir of any receiving waters must be kept from exerting their damaging influence on bathing beaches, tidal estuaries and other water resources. Controlling the flow from outfalls by the electrode potential should significantly help to minimize such insults to the environment.

Water Pollution Control Research Series 16090 FPW 03/70, August 1970. 235 p, 6 append. FWQA Contract WP-01087. FWQA Program 16090 FPW.

Descriptors: *Water rights, *Federal-State water rights conflicts, Federal jurisdiction, Riparian land, State jurisdiction, Water Law, *Water storage, Water Quality, *Flow augmentation, Legal aspects, Water pollution control, Low-flow augmentation.

Enabling legislation for storage of water in Federal reservoirs for supply purposes and quality control through low-flow augmentation includes the Water Supply Act of 1958, the Watershed Protection and Flood Prevention Act, and the 1961 Amendment to the Federal Water Pollution Control Act. The Flood Control Act of 1944 and the Federal Water Power Act also have possible applicability. The enabling legislation and other law defining the operating procedure of the federal water resource agencies make water supply and water quality storage somewhat dependent on the provisions of state water law. State law may affect the aquisition of water rights for storage and the procedure whereby it is applied to its intended functions. The impact of state law on the aquisition process varies according to whether water rights are aquired by the United States or by a private party. When private interests are responsible, as in the case of water supply storage in Corps of Engineers and Soil Conservation Service facilities, the aquisition of rights is not as complex as when a Soverign is involved. Aquisition of water rights by the federal government gives rise to federal-state jurisdictional problems and several unresolved questions concerning water rights. State law also affects the use of a natural channel as a conduit because it defines the rights of others to use this water after it is released from storage. A liberal policy of permitting others to use the stored water would have the potential effect of diminishing the benefits to the water supply or water quality storer. THE USE OF ANALOG AND DIGITAL COMPUTERS IN HYDROLOGY.
International Association of Scientific Hydrology, Gentbrugge (Belgium); and United Nations Educational, Scientific and Cultural Organization, Louvain (Belgium).

Proceedings of the Tucson Symposium, International Association of Scientific Hydrology and Unesco, Vol I and II, 1969. 755 p.

Descriptors: *Analog computers, *Digital computers, *Hydrology, *Mathematical models, *Groundwater, *Surface waters, *Application methods.
Identifiers: Hybrid computers.

In order to bring together the analog and digital specialists and the practising hydrologists and to give each an opportunity to become acquainted with the other's views and problems, the Coordinating Council for the International Hydrological Decade organized a Symposium at Tucson, Arizona in cooperation with the International Association of Scientific Hydrology, Unesco, the American Geophysical Union, the United States National Committee for the International Hydrological Decade and the University of Arizona. This joint publication by the International Association of Scientific Hydrology and Unesco of the papers presented at the Symposium considered the following aspects: (1) Analogue Computing Techniques; (2) Digital Computing Techniques; (3) Digital Data Handling Techniques; (4) Hybrid Computing Techniques; (5) Comparative Studies of Computing Techniques; and (6) Mathematics of Computing Techniques. Some papers (Groups 5 and 6) discussed the general theoretical and philosophical aspects of modelling and computers, but most of them described applications (three first groups). The papers of the first series were mostly in relation with problems on groundwater but some of them considered more specific problems such as the influence of man. In the second group, papers were mostly in relation with problems on surface waters: floods, runoff, precipitation, water quality, etc. The different fields of hydrology were represented in the third group. APPLICATION OF COMPUTERIZED OPERATIONS RESEARCH TECHNIQUE FOR OPTIMUM ECONOMIC SIZING OF THE MIDDLE FORK EEL RIVER PROJECT,
California State Dept. of Water Resources. Advanced Techniques Section.
Gary S. Risch.
The Use of Analog and Digital Computers in Hydrology, Vol I, p 268-279, 1968. 10 p, 2 fig, 5 tab.

Descriptors: *Optimization, *Dynamic programming, *Linear programming, *Economics, Reservoirs, Cost, Hydrology, California.
Identifiers: Eel River Project, California.

Development of the Eel River, involving three potential reservoirs and a connecting tunnel, provided an opportunity for the use of linear and dynamic programming on a medium sized project. A computer model was formulated for both linear and dynamic programming solutions. The techniques aided the planner in analyzing hydrologic and economic problems and provided an optimum economic solution with less effort than expended using conventional methods. Because of increased computer time inherent in linear programming, dynamic programming was chosen for the part two sizing problem and linear programming was therefore used for the part one sizing problem. The object function was to minimize the system cost, given a required system yield. Dynamic programming maximized overall efficiency. For the Eel River problem, three reservoirs comprised three stages and the various values of firm water yield for each stage was considered by the states. Using a trial and error optimization method, every possible sequence of interrelated decisions was explored, (See also W71-00071) (Kriss-Cornell)

MULTIRESERVOIR OPERATION STUDIES,
Arizona Univ., Tuscon; and Network Analysis Corp., Port Washington, N.Y.
Theodore G. Roefs, and Lawrence D. Bodin.
Water Resources Research Vol 6, No 2, p 410-420, April 1970.

Descriptors: *Reservoir operation, *Stochastic processes, *Streamflow, Optimization, Mathematical studies, Computers, Computer program, Risks, Decision-making, Storage, Hydroelectric power, Model studies, Probability, Inflow, Discharge, Dynamic programming, Flood control, Costs.
Identifiers: Multireservoir studies, Dantzig-Wolfe.

The determination of a reservoir operation rule has been treated as a 'worst case' deterministic problem. This has been severely criticized but at present there is a dearth of valid alternative methods. An implicit stochastic process is compared to possible alternative analytical processes. This process refers to a sequence of steps consisting of streamflow synthesis, deterministic optimization, and multivariate analysis of deterministic optimization results. Some formulations based on the method of Dantzig-Wolfe decomposition are shown to be reasonably accurate presentations of a nonlinear multireservoir deterministic optimization problem. The authors analyze the procedures for the determination of an optimal operation problem in terms of the economic factors involved. They conclude that, although it would produce large cost savings in the operation of large multiple reservoir systems, the answer will necessitate technological development at substantial expense, this expense will make the operation economically unfeasible. (Murphy-Rutgers)

ECONOMETRICS AS PIONEERING IN NONEXPERIMENTAL MODEL BUILDING,
Uppsala Univ. (Sweden). Inst. of Statistics.
Herman O. Wold.
Econometrica Vol 37, No 3, p 369-381, July 1969.

Descriptors: *Economic research, *Operations research, *Mathematical studies, *Forecasting, Model studies, Economic evaluation, Prices, Demand, Regression analysis, Income, Social aspects, Planning, Research.
Identifiers: *Econometrics, *Operation analysis, Experimental models, Nonexperimental models, Unirelational models, Multirelational models.

Econometrics serves the purposes of operations analysis, thus involving a synthesis of experimental and nonexperimental model building. This paper

focuses on three aspects of econometric model building and operations analysis. The first is the gradual evolution in the construction of unirelational models and the succeeding rise in aspiration levels by building multirelational models. The second aspect is that of econometrics as a spearhead in the nonexperimental methods of model building. The third aspect deals with the lessons that can be drawn from econometrics to promote interdisciplinary developments of the social sciences. The widespread use of econometric methods in water resources research makes its evaluation in terms of the scientific evolution of interest to the water researcher. (Murphy-Rutgers)

A NOTE ON REGIONAL INPUT-OUTPUT MODELS,
South Carolina Univ., Columbia.
Teddy T. Su.
The Southern Economic Journal Vol XXXVI, No 3, p 325-327, January 1970.

Descriptors: *Input-output analysis, *Regional analysis, *Imports, Model studies, Economic evaluation, Labor, Capital, Industrial production, Technology, Demand, Income, Employment, Government, Investment, Taxes.
Identifiers: *National input-output, Input-coefficient matrix, Income multiplier, Employment multiplier.

Many water resource development projects are concerned with the overall economic development of the area in which they are located. This paper attempts to supplement traditional regional input-output models with a practical analytical tool based on the modified national input-output model. The author emphasizes the importance of imports from other regions and uses the national input coefficients only to reflect the technology of the normal production process. The article argues that values of income and employment multipliers in other regional input-output models based on national input coefficients are overestimated. Thus, any regional economic projections will appear to be too optimistic without accounting for the effects of imports into the region. These conclusions should lead to some changes in the method in which the water researcher attempts to determine the effect of, and future need for, water resource development. (Murphy-Rutgers)

THE SYMMETRIC FORMULATION OF THE SIMPLEX METHOD FOR QUADRATIC PROGRAMMING,
Calgary Univ. (Alberta); and Purdue Univ., Lafayette, Ind.
C. Van De Panne, and Andrew Whinston.
Econometrica Vol 37, No 3, p 507-527, July 1969.

Descriptors: *Mathematical studies, *Economic evaluation, *Programming, *Optimization, Model studies, Distribution patterns.
Identifiers: *Simplex method, *Quadratic programming, *Tableaux, Convergence, Symmetry, Symmetric variant, Parametric methods.

This article gives a reformulation of the simplex method for quadratic programming with the advantage of generating tableaux of certain symmetry properties. The quadratic programming problem is briefly stated, and the equations of the Kuhn-Tucker conditions are formulated. These equations are used to give the set-up tableau from which all other tableaux are derived. The symmetric variant of the simplex method for quadratic programming is then explained and, using the symmetric properties of the tableaux, explicit formulas for triangular tableaux are developed. The properties of the standard tableaux are derived and the relationships with other methods are studied. The potential use of quadratic programming in water resources research makes this article relevant to researchers interested in obtaining a basic understanding of the technique. (Murphy-Rutgers)
W71-00298

INVESTIGATING CAUSAL RELATIONSHIPS BY ECONOMETRIC MODELS AND CROSS-SPECTRAL METHODS,
Nottingham Univ. (England).
C. W. J. Granger.
Econometrica Vol 37, No 3, p 424-438, July 1969.

Descriptors: *Economic evaluation, *Model studies, *Mathematical studies, Statistics, Regression analysis, Correlation analysis, Fluctuation.
Identifiers: *Econometrics, *Feedback, Causality, Spectral methods, Causal lag.

The object of this paper is to discuss the relationships between certain classes of econometric models involving feedback and the functions arising in spectral analysis, particularly the cross-spectrum and the partial cross-spectrum. The paper demonstrates that in the two-variable case the feedback mechanism can be broken down into two causal relations and that the cross-spectrum can be considered as the sum of two cross-spectra, each closely connected with one of the causations. Measures of causal lag and causal strength can then be constructed. A generalization of this result with the partial cross-spectrum is then suggested. The potential use of spectral analysis in empirical analyses of water resources makes this article relevant to the water area. (Murphy-Rutgers)
W71-00299

COMMENT ON FACTOR ANALYSIS AND REGRESSION,
Chicago Univ., Ill.
Benjamin King.
Econometrica Vol 37, No 3, p 538-540, July 1969.

Descriptors: *Mathematical studies, *Statistical analysis, *Regression analysis, Model studies, Economic evaluation, Measurement, Least squares method, Random processes.
Identifiers: *Econometrics, *Multicolliniarity, *Factor analysis, Factor loading matrix.

This paper attempts to demonstrate that if one believes in an underlying factor analysis model involving fewer factors than there are variables, this is equivalent to the acceptance of an error in the variables model for which the parameters may be calculated directly from the factor loading matrix. However, difficulties arise if interest is in the coefficient interpreted as the marginal contribution of this variable to the dependent variable. The problem then becomes one of having more than one solution. The author also objects to the assumption of perfect multicollinearity among the true variables, as implied by the factor model. Cases of errors in the variables and high intercorrelation are frequent in econometric studies in water resources. Accordingly, this paper may provide useful methodology for empirical studies in the water area. (Murphy-Rutgers)

A MUNICIPAL WATER DEMAND MODEL FOR THE CONTERMINOUS UNITED STATES,
Avco Economic Systems Corp., Washington, D.C.
Thomas R. Burke.
Water Resources Bulletin, Vol 6, No 4, p 661-681, July-Aug 1970. 2 fig, 7 tab.

Descriptors: *Municipal water, *Water demand, *Planning, *Model studies, Social aspects, Data collections, Regression analysis.
Identifiers: *Economic model, *Water resources planning, Initial effort.

With the increasing Federal role in all aspects of water resource planning, the need for a planning model to enable calculations of projected Municipal Water requirements has become evident. This study represents an initial effort at developing an economic model of Municipal Water requirements which (1) incorporates variables (or proxies) reflecting the various factors affecting water demand (i.e., demographic, social, industrial), and (2) requires only readily available, published data for its use. This model permits determinations of the water requirements of 488 cities grouped into 19 geographic regions or 'Pseudo States.' Separate regression functions have been fitted to the cities within each of the 19 regions. Derivation of the exact functions for each region entailed a cross section stepwise regression analysis in which some 8 different variables were examined. (Marriott-Chicago)

ELECTRONIC ANALOG MODELING AS AN AID IN WATER RESOURCE INVESTIGATIONS,
Soil Conservation Service, Hyattsville, Md. Central Technical Unit.
E. B. Warnick.
American Society of Agricultural Engineers Transactions, Vol 12, No 5, p 621-623, September-October 1969. 3 p, 7 fig, 1 tab, 2 ref.

Descriptors: *Water resources, *Water resources development, *Investigations, *Analog models, Electronic equipment, Systems analysis, Streamflow, Surface waters, Groundwater, Irrigation, Precipitation (Atmospheric), Runoff, Crops, Wetlands, Turbidity, Reservoirs, Water management (Applied), Planning, Conjunctive use, Cost-benefit analysis.
Identifiers: Historical data, Sevier River Basin (Utah).

The complex interrelation of surface water, groundwater and return flow from irrigation diversions of the Sevier River Basin, Utah has fostered the use of an electronic analog model in processing data to aid in the water supply and distribution analysis. By using the analog model described, the Sevier River Basin Study staff has been able to analyze in more detail a greater variety of potential water management improvement projects. Because of this variety, it was possible to develop generalized relations to describe the possible future impacts on river flow and groundwater reservoirs caused by potential projects. Local sponsors of improvement proposals using the relations developed can plan a series of coordinated projects where the adverse downstream effects of a project in one area can be overcome by another project in the downstream area. This type of coordinated planning can maximize the economic benefits and minimize costly mistakes in managing the water resources available within the basin. Graphs, maps, tables of data and pictures of the analog model are included. (Woodard-USGS)

FLORIDA WATER AND RELATED LAND RESOURCES--ST. JOHNS RIVER BASIN.
Florida Dept. of Natural Resources, Tallahassee.

Florida Department of Natural Resources Report, 1970. 205 p, 72 fig, 53 tab, 337 ref.

Descriptors: *Water resources, *Water resources development, *Florida, Groundwater, Surface waters, Water sources, Water supply, Recreation, Irrigation water, Municipal water, Industrial water, Data collections, Hydrologic data, Hydrogeology, Aquifers.
Identifiers: St. Johns River basin (Florida).

A report on studies of water availability and use in the state of Florida covers approximately 11,431 square miles and includes all or parts of 19 counties in the St. Johns River basin. Sub-basins draining into the St. Johns River and the adjacent coastal sub-basin were included. Projections for the time frames 1980, 2000 and 2020 were used throughout. A broad hydrological inventory shows water occurrence and availability by source. Chemical and biological quality considerations are included. Major uses of the water resources are discussed by major user type and geographic area. Use projections are given by type and water source. Programs underway and planned by Federal, State, regional and local agencies are listed. Potentials for development are discussed as alternative solutions. The recreation situation in the basin is given with primary emphasis on water-related recreation. The recommendations are problem-oriented and are an extension of the potentials for development, land, and recreation sections. (Knapp-USGS)

DEVELOPMENT OF WATER RESOURCES IN APPALACHIA - PART I, SUMMARY REPORT.
Corps of Engineers, Cincinnati, Ohio. Office of Appalachian Studies.

Report on Development of Water Resources in Appalachia published in 25 volumes. Corps of Engineers, Office of Appalachian Studies Summary Report, Vol 1 of 25 Vol, Part 1, Main Report, December 1969. 241 p, 17 fig, 16 tab, 10 ref.

Descriptors: *Water resources development, *Water requirements, *Surveys, *Planning, *Appalachian Mountain region, Area redevelopment, Natural resources, River basin development, Water resources, Hydrologic data, Data collections, Investigations.
Identifiers: *Appalachian redevelopment.

The investigations required to carry out a special survey of water and related resources in the Appalachian Region have been completed, and the plan developed is summarized. The purposes of the water resources survey embrace two of the most important fields of national policy: economic development and growth, and natural resource conservation and development. These purposes are: to analyze the water resource potential in Appalachia in relation to the need for accelerated economic development in this region; to develop a long range plan under which the water resources of Appalachia may be effectively utilized to further the economic and social goals of the region. This plan will require coordination among Federal, State and local development efforts; to identify water and related resources investments which may be undertaken immediately or in the near future for the development of Appalachia; and to provide a framework of continuing cooperative relationships for further planning of water resources for Appalachian economic development. SOCIO-ECONOMIC PROBLEMS IN WATER RESOURCE USE AND CONTROL - PRODUCTION FUNCTIONS AND SOCIAL COSTS,
Auburn Univ., Ala. Water Resources Research Inst.
Donald R. Street.
Available from NTIS as PB-194 786, $3.00 in paper copy, $0.95 in microfiche. Auburn University School of Business Report Series 1, May 1970. 24 p, 11 fig, 8 ref. OWRR Project B-012-ALA (2).

Descriptors: *Water resources development, *Water management (Applied), *Economics, *Resource allocation, Multiple purpose, Systems analysis, Water conservation, Optimization, Benefits, Costs, Decision making, Operations research, Social aspects.
Identifiers: Resource management, Production functions.

Some production effects which are possible in water resource use and control, with implications on the economic welfare of the community are discussed. Recent research in Alabama and in other areas has shown that trends in the growth of industrial and municipal use of water indicate an increased incidence of conflicts which may affect future income alternatives. Problems appear in the form of various external effects, social costs, and interactional effects which originate according to the method or ordering of water resource use. Some opportunities and techniques for resource adjustment in solving water-related problems are discussed. The production function is fundamental to all economic development in an area. Basically, the production function is a relationship between inputs of resources, such as land, labor, and capital, and some product used by society. Systems analysis methods may also be adapted to solving resource allocation problems. (Knapp-USGS)

COMPETITIVE RECREATIONAL USES OF SELECTED IOWA LAKES,
Iowa State Water Resources Research Inst., Ames.
Arnold O. Haugen, and Arnold J. Sohn.
Available from NTIS as PB-194 800, $3.00 in paper copy, $0.95 in microfiche. Completion Report, Iowa State Water Resources Research Institute, June 30, 1968. 173 p, 45 tab, 38 fig, 21 ref, 2 append. OWRR Project A-005-IA (1).

Descriptors: *Recreation, Recreation facilities, *Boating, *Lakes, Swimming, Recreation demand, Boat-launching ramps, *Water utilization, Iowa, Sport fishing, Waterfowl, Hunting.
Identifiers: *Recreational use patterns, Clear Lake, Spirit Lake, Okoboji Lake, Little Wall Lake, Eagle Lake, Ventura Marsh.

A study to determine cycles and fluctuations in recreational activity was conducted during 1966 and 1967 on Clear, Spirit, Okoboji, and Little Wall Lakes. Major emphasis was placed on summer activities, with checks of waterfowl hunting intensities on Eagle Lake and Ventura Marsh conducted during the fall hunting seasons. In addition to describing activity cycles, an attempt was made to analyze areas of present or future conflict between users. Primary sources of data included: Time-lapse movie camera records as indices to activity cycles; questionnaires to short-term visitors and permanent residents on the lakes; pneumatic car-counter records at park entrances and boat-launching ramps; line intercept counts of boat traffic; counts and location plottings of boats on the lakes; and interviews with lake personnel including Water Safety Patrol officials, resort operators, and other businessmen located near the lakes. It is recommended that: (1) a limit of 50 be placed on the number of power boats permitted on Little Wall Lake at one time, or on the size of motors allowed on the lake; (2) steps should be taken immediately to isolate swimming facilities from boat launching facilities, a minimum distance of 300 feet should be allowed between ramps and swimming areas; (3) lake front property should be acquired at a resonable price in the future. Portions of Clear and West Okoboji lakes should be zones to a 'No Wake' speed for power boats, thereby providing areas for fishing, canoeing, etc.; (4) marshes such as Eagle Lake should be managed for waterfowl production and hunting areas. Drainage, dredging, or flooding, other than to improve waterfowl conditions, is not recommended, (5) opening of newly constructed reservoirs in Iowa will require studies to analyze changes and other trends in recreational use patterns.

ENGINEERING AND ECONOMIC RELATIONS IN THE SELECTION AND CLASSIFICATION OF IRRIGABLE LANDS,
Bureau of Reclamation, Denver, Colo.
John T. Maletic, and Waldron H. Yarger.
7th Congress on Irrigation Drainage, Quest 26, Rep Disc, R1-R33, p 26.297-26.310, Mexico City, 1969. 16 p, 4 fig, 19 ref.

Descriptors: *Land classification, Land development, Land reclamation, Land settlement, Land resources, Land use, Engineering, Economics, Land, *Irrigable land, Project planning, Social aspects, Farms, Irrigation, Farm units, Drainage, Economic feasibility, Bibliographies.
Identifiers: Engineering economy, *Selection, Irrigated agriculture.

Successful settlement of irrigation projects can best be handled by integration prior to construction of the project facilities of several disciplines into a forecast of desirable and practical measures for development of each farm unit. An irrigation suitability classification provides the basic information on land resources of the project area. Unlike soil surveys, many initial agronomic, economic, and engineering aspects of project planning are incorporated in this classification. Subsequent integration with drainage costs, water service costs, and economic limitations permits the selection of lands to be served and a forecast of requirements for farm unit development, such as landforming, drainage, farm water application facilities, soil amendments, farming equipment, and credit and capital requirements. The project plan should include a forecast and timing of who will provide the amount of capital and labor inputs for putting the land into production most expeditiously. In the developing nations, irrigation project planners should make a special effort to develop plans reflecting the social and cultural environment which, to a large extent, determines the success of the project. (USBR)

A REVIEW OF INTER-REGIONAL AND INTERNATIONAL WATER TRANSFER PROPOSALS.

West States Water Council, Salt Lake City, Utah. June 1969. 13 p, 3 map, 30 ref.

Descriptors: *Water resources, Water resource development, *Planning, Natural resources, *Inter

basin transfers, Surplus water, Reviews, Water supply, Foreign countries, Mexico, Bibliographies.
Identifiers: Western States Water Council, Canada, *Interbasin water transfer, International relations, *Water plans.

Large-scale water transfers reviewed are international in scope and involve Canadian sources. Until Canada has fully evaluated future needs and resources of the prairie provinces, very little serious discussion of any proposal to export water from central Canada is expected. Fourteen interregional and interbasin water transfer plans in the U S are discussed. Inventories of water and land resources, and the development of statewide and basinwide water plans are needed. Any meaningful large-scale water transfer proposal should be the result of careful basin-by-basin evaluation of natural supplies, thoughtful projections of future needs, and cooperative consideration of long-range development. THE MEASUREMENT OF BENEFITS OF TROUT FISHING: PRELIMINARY RESULTS OF A STUDY AT GRAFHAM WATER, GREAT OUSE WATER AUTHORITY, HUNTINGDONSHIRE,
Birmingham Univ. (England). Dept. of Industrial Economics and Business Studies.
Robert J. Smith, and N. J. Kavanagh.
Journal of Leisure Research Vol 1, No 4, p 316-332, Autumn 1969.

Descriptors: *Recreation, *Fishing, *Demand, Benefits, Costs, Economic evaluation, Statistics, Planning, Prices, Reservoir, Time.
Identifiers: *Grafham Water, *Demand curve, *Willingness to pay, Visitation rates.

This paper is concerned with the empirical estimation of a demand curve for a trout fishery. The reasons for measuring the economic benefits of recreation and the difficulties involved in obtaining an objective measure of these benefits are discussed. The authors explain the economist's approach to recreation valuations and outline several benefit measures. A measure of benefits requires information on prices. The methodology developed by M. Clawson to provide this type of information is described. The basis of this approach is a relationship between distance and visitation rates from zones surrounding the fishery. Using this methodology the authors attempt a study of the data on trout fishing at Grafham Water. They measure the recreational demand for trout fishing at this site, as well as estimate the monetary benefits of trout fishing under various assumptions with respect to the valuation of angler's time. (Murphy-Rutgers)

ECONOMIC ASPECTS OF THE ENVIRONMENT,
Resources For the Future, Inc., Washington, D.C.
Allen V. Kneese.
In: Regional Planning Challenge and Prospects New York, Frederick A. Praeger, 1969, p 88-91.

Descriptors: *Decision making, *Water pollution, *Natural resource allocation, *Economies of scale, *Regional analysis, *Planning, Technology, Taxes, Government, Watercourse, Costs, Reservoirs, Waste treatment.
Identifiers: Externalities, Market place, Spillover costs, Urban economics.

This article discusses the approach of economics to problems of environmental quality. It is proposed that normative economic theory's basic premise that individual choice should govern resource use to its maximum extent, is useful in such environmental problems. Three major questions are discussed in order to increase the efficiency of the decision-making process in determining the allocation of resources. The first is whether a satisfactory allocation of income exists which would facilitate a collective ethical standard in environmental quality. The second is whether decisions on the use of resources are really independent of each other- i.e. are the costs of using a watercourse for waste disposal borne only by those deciding to use the watercourse for that purpose. The third and final question asks whether collective decision making can realize economies of scale inherent in the economy's technology. The questions have arisen from the problems of pollution in regional planning and should aid the economist in a decision-making position in the water resources area. (Murphy-Rutgers)

TIME BIAS IN RECREATION BENEFIT ESTIMATES,
Battelle Memorial Institute, Columbus, Ohio.
Frank J. Cdsario, and Jack L. Knetsch.
Water Resources Research, Vol 6, No 3, p 700-704, June 1970.

Descriptors: *Economic value, *Recreational demand, Constraint, Water resource development, Monetary costs, Economic welfare.
Identifiers: *Recreational benefit, *Time cost, *Trade-off function, *Bias, Travel costs, Proxy, Indivisibilities, Convexity.

The authors are concerned with the measurement of outdoor recreation benefits associated with activities involving water resource use. A benefit measure is defined operationally in terms of what an individual would be willing to pay to use the resources rather than have to go without the resource services. The willingness to pay criterion is measured by the area under the aggregate demand curve. Previous attempts at estimating the benefits of outdoor recreation have involved the estimation of recreation demand curves with travel cost data as a proxy for prices. This method related changes in cost of visits to changes in number of visits per capita. There has been a conservation bias in the benefit estimate obtained because of the omission of travel time differences. This article suggests the use of a trade-off function between money and time costs in order to eliminate bias. The author expects larger recreation benefits through the use of this technique. This refinement in the measurement of outdoor recreation should be an aid to overall water resource planning. (Siegenthaler-Rutgers)
W71-00277

WEIGHING RISK IN CAPACITY EXPANSION,
Lilly (Eli) and Co., Indianapolis, Ind.
John R. Virts, and Richard W. Garrett.
Harvard Business Review, Vol 48, No 3, p 132-141, May-June 1970. 6 fig, 1 tab, 1 append.

Descriptors: *Risks, Distribution patterns, Forecasting, Computer models, Statistical methods.
Identifiers: *Capacity, Production facilities, Affordable risk ratio, Capacity expansion.

A company's manufacturing capacity must be designed to support its marketing plans while also satisfying corporate strategy and objectives. But because the uncertainties of product and process forecasts tend to be cumulative, the task of estimating future requirements for facilities, which depends on these prior forecasts, is a difficult one. A first step in developing a facilities plan is to balance the risks and uncertainties of forecasts with the economic penalties of having too much or too little capacity. However, figures for sales and yields are normally uncertain, and forecasts are continually being revised. As such, facilities planning becomes complex. The authors develop a method of measuring the risk in facilities planning making use of computerized model of plants serving worldwide markets. The model uses operations research and microeconomic theory to produce an affordable risk ratio. This has been used by Eli Lilly and Company to compare alternative plans for expansion of facilities. This may prove to be of interest to the water researcher concerned with decisions pertaining to the creation of new facilities. (Loeb-Rutgers)
W71-00283

DO MANAGERS FIND DECISION THEORY USEFUL,
Michigan Univ., Ann Arbor.
Rex V. Brown.
Harvard Business Review, Vol 48, No 3, p 78-89, May-June 1970. 1 fig.

Descriptors: *Decision making, Probability, Return costs, Benefits, Risks, Management.
Identifiers: *Decision theory analysis, *Decision theory, *Manager, Quantitative analysis, Obstacles.

The author presents in this paper a discussion pertaining to decision theory. In particular, the author considers a set of techniques of quantitative analysis which is referred to in the paper as Decision Theory Analysis (DTA). The primary purpose of this article, which is based on a survey of 20 companies, is to present some of the experiences of practitioners who have been exploring various applications of DTA techniques to management decision making. These experiences should help would-be users to identify particular situations in their own companies where the new technology might greatly benefit them, and to build on the lessons learned by earlier users. The aritcle discusses such questions as: the tangible impact DTA has on how businesses are run and how individual decisions are made, the areas of decision making DTA is best suited for, what practical benefits result, what trends in usage are apparent, what obstacles lie in the way of more effective usage, how management can make the use of DTA more effective and what remains to be done in developing and expanding the usefulness of DTA. This may prove valuable to the water researcher or water manager involved with decision making. (Loeb-Rutgers)
W71-00284

PUT POLICY FIRST IN D C F ANALYSIS,
Olivetti Co., Ivrea (Italy).
Paul Welter.
Harvard Business Review Vol 48, No 1, p 141-148, January-February 1970.

Descriptors: *Investment, *Economic evaluation, *Discount rate, *Costs, *Capital, Interest rate, Financing, Computers, Rate of return, Risk, Decision-making, Profit, Taxes, Management.
Identifiers: *Discounted cash flow, Growth, Debt/equity ratio, Bonds, Logic flow chart.

The problems of evaluating alternative investments in the water resource area are numberous and have led, in many instances, to the use of discounted cash benefit flow (DCF) as the most appropriate tool for investment appraisal. The author discusses the two major processes involved in DCF analysis; calculating DCF, and determining the appropriate discount rate. The calculation of DCF involves a decision as to the proper method, either rate of return net present value or discounted pay-back period. Once this is done it is necessary to estimate the cash flow and to evaluate the risks involved. The author next discusses the determination of the discount rate. This is especially troublesome in the water resource area due to the presence of externalities. The proper rate is evaluated in terms of the minimum acceptable rate of return and the need for future investment capital. With the inclusion of social benefits into the discount rate this method is directly applicable to water resource investments. (Murphy-Rutgers)

W71-00285

MANAGEMENT EVOLUTION IN THE QUANTITATIVE WORLD,
Virginia Univ., Charlottesville.
Robert F. Vandell.
Harvard Business Review Vol 48, No 1, p 83-92, Jan-Feb 1970.

Descriptors: *Management, *Statistical methods, *Data processing, Economic efficiency, Computers, Technology, Costs, Benefits, Financing, Labor, Programs, Planning, Risk, Decision-making.
Identifiers: *Quantitative analysis, Decentralization, Manpower, Hardware, Marketing, Mobility.

The recently acquired tools of quantitative analysis and data processing have made possible more complete evaluations of investment alternatives in the water resource area. However, this article shows that management must undergo some radical changes if these tools are to be utilized fully. The author discusses the shape these changes will take and sets forth some guidelines managers can use in preparing themselves for the changes. The evolution of more economically efficient methods of management over the next decade will suffer sharp discontinuities unless a concerted effort is made to understand these two tools. The relevance of the author's observations to water utility management makes this article of interest to the water researcher. (Murphy-Rutgers)
W71-00286

RISK AND THE SOCIAL RATE OF DISCOUNT,
Northwestern Univ., Evanston, Ill.
Mark V. Pauly.
American Economic Review Vol LX, No 1, p 195-198, March 1970.

Descriptors: *Rate of discount, *Investment, *Government, Risk, Income, Cost benefit analysis, Economic evaluation, Rate of interest, Economic efficiency, Taxes.
Identifiers: *Social rate of discount, Public investment, Bonds, Rate of return.

The article attempts to clear up the controversy about the proper rate of discount to use in evaluating benefit and cost streams from public investment. Since a proper discount rate is an important part of the economic evaluation of water resource projects, this article should be of use to the water researcher. The author shows that the rate at which individuals are willing to loan money to the government necessarily understates the true social cost of the investment and should not be used as the social rate of discount. It is also shown that if taxation-induced distortions are ignored, the correct rate for evaluating government investment opportunities may be equal to, or greater than, the private rate of return. (Murphy-Rutgers)
W71-00287

APPROACHES TO VALUE CHOICES,
Wayne State Univ., Detroit, Mich.
Norman Wengert.
In: Regional Planning-Challenge and Prospects, New York, Frederick A. Praeger, 1969, p 98-102.

Descriptors: *Environmental effects, *Cost-benefit analysis, *Planning, Decision-making, Streams, Technology, Natural resource allocation, Economic analysis, Engineering personnel, Sanitation.
Identifiers: *Environmental change, Democracy, Majority rule, Economists, Professional interest, Sanitarians.

This article discusses the problems of values in environmental planning. The author points out that environmental decisions will be effected by the often conflicting goals of different professionals with different objectives. Such individuals as economists, engineers, sanitarians, and fishermen would have widely diverse suggestions about what would be environmentally best for a stream. Such differences are based on technological background, authority, and associates of each person involved. To deal with such difficulties, the author suggests three basic needs. The values must be identified, an awareness of mechanisms and processes for making value choices must be developed, and it must be recognized that value decisions often involve hard choices. The author stresses the importance, in decision-making for environmental planning, of a cost benefit analysis of the factors involved. Finally, it is emphasized that, to be rational, environmental planning must be constantly directed toward a specific goal, thus necessitating long-range as well as short-range planning. (Murphy-Rutgers)
W71-00289

AGENCY BUDGET PROBLEMS,
Bureau of the Budget, Washington, D.C.
Carl W. Teller.
In: Public Budgeting and Finance, Itasca, Illinois, Peacock Publishers, 1968, p 332-338.

Descriptors: *Budgets, *Government, Decision-making, Planning, Evaluation, Priorities, Efficiency, Financing, Forecasting, Environment, Costs, Economic impact, Economic justification.
Identifiers: *Governmental agencies, *Budget cycle, Budget presentation.

Budgeting serves as a means of weighing choices and determining priorities. Thus this clarification of some of the problems involved should aid the decision-maker in the water resource area. The basic budget considerations which must be considered are outlined and the five most important facets of a budget officer's responsibility discussed. The author then studies problems of budgeting in government agencies which he considers as problems of environment, problems inherent in the budget process or problems relating to budget presentation. These difficulties are analyzed and suggestions made to alleviate them. Throughout the article the author stresses the need to make the budgeting process a more effective tool for decision-making. (Murphy-Rutgers)

IDENTIFICATION AND SPECIFICATION ANALYSIS OF ALTERNATIVE EQUATIONS FOR ESTIMATING THE ELASTICITY OF SUBSTITUTION,
Tulane Univ., New Orleans, La.
J. R. Moroney.
The Southern Economic Journal Vol XXVI, No 3, p 287-299, January 1970.

Descriptors: *Profits, *Returns to scale, Economic evaluation, Capital, Labor, Model studies, Maximization, Statistics, Economic efficiency, Demand, Industrial production, Optimization, Prices, Costs.
Identifiers: *Elasticity of substitution, *Production function, Cost minimization.

This paper seeks to examine the nature of the assumptions of many previous authors, in estimating the elasticity of substitution between capital and labor, regarding constant returns to scale and purely competitive product and factor markets. The author suggests that the usual estimates of the coefficients of the production function are biased because of certain specification errors. The article proposes an alternative estimation that is not restricted by the above assumptions. The author argues that this alternative equation is free from specification errors and is suitable for estimation under conditions of non-constant returns to scale and imperfectly competitive product markets. Attempts at estimating production functions for the water utility industry have been hampered by the use of the profit-maximizing relation with which the author finds fault. The reliance on the cost minimization relationship that the article suggests, should more accurately describe the elasticity of substitution in the water resources area. (Murphy-Rutgers)
W71-00291

ALTERNATIVE RATE OF RETURN CONCEPTS AND THEIR IMPLICATIONS FOR UTILITY REGULATION,
Stanford Univ., Calif.
Ezra Solomon.
The Bell Journal of Economics and Management Science Vol 1, No 1, Spring 1970, p 65-81.

Descriptors: *Capital, *Costs, *Discount rage, *Economic evaluation, *Utilities, *Government, Depreciation, Growth rates, Prices, Investment, Taxes, Model studies, Budgets, Forecasting, Planning.
Identifiers: *Rate of return, *Utility regulation, Book rate unit, Expensing policy, Discounted cash flow.

The rate of return on invested capital is widely used as a basis for decisions in utility regulation. One of its essential purposes is to provide a comparison between actual or prospective performance and the cost of capital, which is the required or expected performance. Large utilities often set prices to achieve the rate of return dictated by the regulatory agencies. However, there is a problem in that the rate of return is measured in terms of two distinct units. The book rate unit is defined as the ratio of income during a given period of time to the net book-value of invested capital outstanding. The discounted cash flow unit measures the return on capital in terms of the annual rate at which the future new funds flows from an investment have a discounted value equal to the value of investment outlays required to bring about these fund flows. This paper indicates the relationship between the two measures and shows the impact of some variations in depreciation and expensing procedures, growth rate, etc. The paper should be of use in the regulation of water utilities. (Murphy-Rutgers)
W71-00292

TAXATION, SUBSTITUTION AND INDUSTRIAL LOCATION,
Rice Univ., Houston, Tex.
Charles B. McLure.
Journal of Political Economy, Vol 78, No 1, p 112-132, Jan-Feb 1970.

Descriptors: *Taxes, *Government, *Economic evaluation, *Model studies, Consumption, Prices, Government supports, Capital, Income, Mathematical studies, Labor wages, Demand, Industry.
Identifiers: *Industrial location, *Factor mobility, *Substitution, Unemployment, Elasticity.

This paper is an attempt to develop a theory on the impact of tax policy on the location of industry. It is relevant to the water resource planner interested in the effect on the regional economy of resource development projects. A general equilibrium neoclassical model is used to outline several important determinants of the sensitivity of industrial location to various general taxes levied in a state. This model may be extended to measure the effects of water resource projects on the local economy. The model employs comparative statics analysis to emphasize the role played by substitution in consumption and production and by the mobility of factors in determining the direction and strength of industry's locational response to taxation. The examination is limited to the analysis of the capital flows induced by interstate differentials in various kinds of general taxes in a full employment economy. (Murphy-Rutgers)
W71-00293

THE ECONOMICS OF CONGESTION AND POLLUTION: AN INTEGRATED VIEW,
Massachusetts Inst. of Tech., Cambridge.
Jerome Rothenberg.
American Economic Review Vol LX, No 2, p 114-121, May 1970.

Descriptors: *Environmental pollution, *Economic evaluation, *Mathematical models, Prices, Income, Planning, Profit, Demand, Cost, Government, Population, Sewerage, Benefits, Economic efficiency, Optimization, Resource allocation, Investment.

entifiers: *Public goods, *User charges, *Urban ngestion, *Generic congestion.

nvironmental pollution and urban congestion ave much in common and an exploitation of this milarity throws light on why the problems are so itical, what their consequences are and what nds of measures can be used to mitigate their mage. This paper integrates the distinctive aracteristics of the two together, as aspects of e phenomenon. The author first discusses the na- re of the socioeconomic interaction. The ramifi- tions are then explained through the use of a athematical model treating both the positive and rmative considerations. Under the broad classifi- tion of the generic congestion process, some spe- alized forms of congestion and pollution are con- dered. The author demonstrates that a system thout congestion charges will differ from one th charges primarily by more congestion at any e time and a more rapid worsening of the oblem over time. As a part of environmental pol- tion, water pollution abatement could benefit om the application of the conclusions reached re. (Murphy-Rutgers)

CTIVITY SPECIALIZATION AMONG OHIO'S ECREATION BOATERS,
exas A and M Univ., College Station; and Ohio ate Univ., Columbus.
arlton S. Van Doren, and Barry Lentnek.
ournal of Leisure Research Vol 1, No 4, p 296- 15, Autumn 1969.

escriptors: *Recreation, *Boating, *Demand, Economic evaluation, Statistics, Water demand, ocial aspects, Time, Lakes, Regression analysis, omputer program, Fishing.
dentifiers: *Automatic Interaction Detector, Multivariate techniques, Social status, Boating quipment, Recreational time, Activity analysis, ailing, Water skiing.

n order to plan outdoor recreational facilities to eet future requirements of a large urbanized opulation, demand for specific outdoor activities ust be estimated. For this it is necessary to know e social and economic characteristics of persons ngaging in specific activities. This article attempts identify the characteristics that differentiate oat activity specialists. The authors review the terature dealing with this problem and then sum- arize the methodological problems of predicting emand factors for outdoor recreation. They use e Automatic Interaction Detector program, hich is a multivariate technique, as a predictive ol for characterizing activity preferences. Twen- y-one variates were used to describe the demo- raphic characteristics of the boating parties, the mount of time spent boating and the kind of quipment used. The authors conclude that the ormal social variates are not predictive of activity pecialization. This article is relevant to water stu- ies attempting to forecast the recreational use of a ater project. (Murphy-Rutgers)

COORDINATION IN ENVIRONMENTAL PLANNING,
New York State Dept. of Health, Albany.
Meredith H. Thompson, and M. M. Hufschmidt.
n: Regional Planning-Challenge and Prospects, New York, Frederick A. Praeger, 1969, p 103-105.

Descriptors: *Planning, *Water pollution, Economic evaluation, *Regional analysis, Water esources, Land use, Waste treatment, Air pollu- ion, Navigation, Urban renewal, River basin, En- ironmental effects, Government, Training, Sewerage.
dentifiers: *In service training, *Environmental lanning, Housing.

The authors reiterate the need for coordinated en- vironmental planning and suggest that water resource planners, land use planners, zoners, realty planners, solid waste planners, and air pollution planners must all be brought together to achieve comprehensive environmental planning. Coordination is the key to this, since it is logically impossible to include in a single organization all of the persons responsible for transportation, water resources, or urban renewal development in one region. Such comprehensiveness does not demand unification under one particular bureau, but rather coordinated activity of several pertinent agencies. For instance, comprehensive water pollution control includes groundwater pollution, which in turn involves housing, zoning, and land use. However, the author does point out that a single agency must be responsible for working with comprehensive short and long range plans to integrate agency findings into a final workable product. A METHODOLOGY FOR THE CONSTRUCTION OF ATTITUDE MEASURING INSTRUMENTS,
Missouri Univ., Rolla.
R. N. Sawyer, and T. E. Harbaughn.
Water Resources Bulletin, Vol 6, No 3, May-June 1970, p 401-407. 3 fig, 15 ref.

Descriptors: *Attitudes, *Methodology, Instrumentation, Decision-making, Water resources, Planning.
Identifiers: *Attitude scale, Opinions, Likert scale, Thurstone scale.

To the average layman, the distinction between opinion and attitude is artificial at best, and is neither consistant nor logically defensible. For many purposes one need not distinguish between the two. However, when assessing opinion and attitude the disparity becomes quite evident. Opinion surveys are characteristically concerned with replies to specific questions which need not be related. The responses are kept separately as opposed to being combined into a total score. Attitude scales, on the other hand, typically yield a total score indicating both a direction and intensity of an individual's feelings, thoughts, and predispositions to act toward a given concept. Further, in the construction of an attitude scale, the different statements are designed to measure a single attitude or unidimensional variable. The Likert method of constructing attitude measuring instruments requires a large number of judges to indicate their own attitudes by responding to statements thought to pertain to an attitude in question. Five possible responses are provided for each item. The procedure to construct a Thurstone type scale utilizes The Law Categorical Judgement as a basis. Statements are obtained and analyzed for the various categories and in final form, the attitude scale is presented to the respondent who indicates statements with which he agrees or disagrees. PUBLIC INVESTMENT AND PLANNING: A RESPONSE,
National Audubon Society, New York.
Roland C. Clement.
Water Spectrum, Vol 2, No 2, p 1-4, Summer 1970. 7 ref.

Descriptors: *Planning, *Investment, Institutional constraints, Institutions, Federal government, Coordination, Administration, Social values, Management, Multiple purpose projects.
Identifiers: *Public investment, *Bureaucracy, Multiple-objective programs, U.S. Army Corps of Engineers.

This article is a response to an earlier article on public investment and planning by Arthur Maass. It is felt that the earlier piece did not integrate the various points which were well made and that in several cases, the analysis was insufficient. Several areas of difference are indicated. First, the Corps of Engineers is not really prepared to execute multi-objective programs due to 'bureaucratic schizophrenia,' i.e., an old line civilian bureaucracy oriented toward maintaining project authorizations and the more flexible and advanced military policy-makers. Second, a more rational role in water resources by the Corps is impossible without a reassessment of national needs. Finally, the question of whether the Corps can develop a realistic water resource program is not only a question of capability but also of willingness. (Davis-Chicago)

NEW CONCEPTS IN WATER RESOURCES PLANNING,
Corps of Engineers, Chicago, Ill. North Central Div.
James S. King.
In: Proceedings of the Fourth American Water Resources Conference (American Water Resources Association, Urbana, Illinois, 1968), ed. Phillip Cohen, Martha N. Francisco, p 703-710.

Descriptors: *Planning, *River basin development, *Multiple-purpose projects, *Federal government, State governments, *Local governments, *Institutional constraints, Water Resources Planning Act, Economic efficiency, Interagency cooperation.
Identifiers: *Multiple objectives, *Corps of Engineers, *Criteria, *Mississippi River Basin Study, *Legal constraints, Non-government interests, Green Book, Kerr report, Senate Document No. 97, Water Resource Policy Commission, Missouri Basin Survey Commission, Advisory Committee on Water Resources Policy, Public Law 89-4, Interdisciplinary approach.

Comprehensive water and related land resources planning is a technique of decision making pertaining to the allocation of scarce resources among competing claims. Its ultimate objective is to provide a sound basis on which public investment decisions can be made. An historical picture is given beginning with Federal and State concerns regarding navigation and later irrigation. Hydroelectric power and improved quantity and quality of water supplies followed. Theodore Roosevelt's recognition of conservation initiated a philosophy of integrated multipurpose river basin planning. During the 30's the Corps of Engineers surveyed the major river basins and Federal-State-local drainage commissions were established for all of them. Developments after World War II are reviewed including principles of economic analysis in the 'Green Book', three Presidential Commissions during the 50's, the Kerr report, Senate Document No. 97, the Water Resources Planning Act, and Public Law 89-4. The author suggests that a multiple-objective approach is needed and mentions three broad areas of responsibility and action: Establishment of broad, first-line objectives at the national level; central planning to translate first-line objectives into criteria for formulating plans; formulating an optimum water resources plan, or alternative plans, by field level planning groups. Two types of comprehensive basin studies are suggested: those appraising the institutional and legal constraints thus providing a 'framework' and those utilizing these 'frameworks' within a detailed sub-basin. Observations of the Type 1 Upper Mississippi River Comprehensive Basin Study are included. Three alternative first-line objectives are outlined and it is suggested that one plan is able to satisfy them to varying degrees. (Preckwinkle-Chicago)

URBAN (MUNICIPAL) WATER MANAGEMENT,
Syracuse Univ., N.Y. Coll. of Forestry.
Robert D. Hennigan.
In: Proceedings of the Fourth American Water Resources Conference (American Water Resources Association, Urbana, Illinois, 1968) ed. Phillip Cohen, Martha N. Francisco, p 716-723.

Descriptors: *Administration, *Urbanization, *Water supply, *Drainage, *Waste water disposal, *Water quality, *Economic efficiency, *Utilities Federal government, State government, Local government.

Identifiers: City of New York, Suffolk County, Buffalo-Erie County, Nassau County, Monroe County.

The author argues that the major water resources problem in the country today is poor urban water management. Urban water management consists of water supply development and distribution, surface drainage collection and disposal, and waste water collection treatment, and disposal. With increasing urbanization local water regimen changes drastically resulting in loss of base flow, and in greatly increased storm flows. Rapid runoff also adds to the pollution load. Controversies related to urban water management are mentioned including allocation of Delaware waters involving Delaware and New York, the Colorado River controversy involving Los Angeles, the Chicago Diversion Case, and pollution of the Great Lakes and various other waters. The other traces development of water management from rural society where individual responsibility existed through further developments that dealt with problems as they arose. Resulting from this was a separation of water supply service from other services. Following World War II multiple governmental units were becoming more evident in large urban communities and consolidation efforts rare. Both technically and organizationally, water management needs cannot be dealt with separately. The bases for both the optional governmental service concept and for essential utility services concept are listed in two sets of propositions. Conclusions are that all three services should be consolidated in all urban areas, and given an independent revenue base and status. Financing should be based on user charges. (Preckwinkle-Chicago)

LAND AND WATER RESOURCES MANAGEMENT FOR ENVIRONMENTAL IMPROVEMENT,
Department of Agriculture, Washington, D.C.
Lloyd E. Partain.
Water Resources Bulletin, Vol 6, No 2, April 1970, p 229-234.

Descriptors: *Land management, *Water management, Conservation, Education, Attitudes, Research and development, Decision making.
Identifiers: *Environmental management, *Public awareness, Educational programs.

Traditional conservation measures may not be, and usually are not, all that is needed to assure a quality environment. They are, however, fundamental. A national course of action involving land and water management is determined (1) at the market place, (2) at the ballot box, and (3) in the hearts and minds of individuals. To inform people about environmental management and conservation and appropriate uses of land, water and related resources is an exceedingly difficult problem. Research, action and educational programs dealing with environmental problems must have greater attention and support. (Marriott-Chicago)

EFFECTIVE WATER RESOURCES MANAGEMENT IN THE URBAN SETTING,
Colorado Univ., Boulder. Dept. of Civil Engineering.
J. Earnest Flack, and Duane W. Hill.
Water Resources Bulletin, Vol 6, No 4, p 563-572, July-Aug 1970. 3 fig, 18 ref.

Descriptors: *Water management, *Cities, Flood plain management, Attitudes, Administration, Social aspects, Psychological aspects, Systems analysis, Planning, Behavior.

Water resources management in the urban areas of the United States to be effective must include dimensions far beyond water supply and sewage. This paper concerns itself with those problem areas of water resource management outside of potable water supply and sanitary sewers. These areas include flood plain management, greenways and blueways, storm water, vistas of waterways, and other attributes of living in or near a water-related environment. The perceptions and attitudes of the concerned public and community power structure must be known in order to manage the water environment effectively. Methods of measuring these perceptions and attitudes are described and ways in which the resulting citizen-resource can be tapped and use as a management device are explored. (Marriott-Chicago)

Identifiers: World water use.

The threat of water resources depletion exists and in some regions it has already become a reality. The main reason for this state of affairs is that the policies on which the use and conservation of water resources have been, and are supposed to be based in the future, have, as a rule, become outdated. They were applicable in the past when water needs were small in relation to the available water resources. In many regions which were previously considered rich in water resources, a water deficit has become or is becoming apparent. These regions are found in almost all of Europe, considerable parts of Asia and Africa, and the southern part of North America. A water crisis is not inevitable. The depletion of water resources can be avoided: mankind need not be threatened by a water crisis if more rational policies are adopted in the use and conservation of water resources. An end must be made to the use of rivers, lakes, reservoirs and seas as media for the purification of sewage waters. A start must be made to reducing the water consumed in production in every possible way; decreasing the water consumption per unit of production; searching for ways and means to change over to 'dry' production; and eliminating unproductive losses through evaporation from water and soil surfaces. It may be possible to transform and regulate the hydrologic cycle. More attention should be devoted to the problem of locating population and industry in accordance with the distribution of water resources. It is essential to observe a multi-purpose approach in solving water economy problems. (Knapp-USGS)

WATER QUALITY CRITERIA FOR SELECTED RECREATION USES,
Illinois Univ., Urbana. Water Resources Center.
Doyle D. Bishop, and Robert Aukerman.
Available from NTIS as PB-195 164, $3.00 in paper copy, $0.95 in microfiche. Illinois Water Resources Center, Research Report 33, September 1970. 134 p, 18 tab, 22 ref, append. OWRR Project B-034-ILL (1).

Descriptors: Recreation, *Water quality, *Attitudes, *Behavior, Water pollution effects, *Standards, *Planning, *Recreation demand.
Identifiers: Perceptions, User satisfaction, Criteria, Quality of experience.

Four types of outdoor recreationists were investigated to determine whether they differed in their attitudes, beliefs, and behavior regarding various water characteristics at Central Illinois water-based recreation sites. Using an attitude model derived from social-psychological research, the recreationists' attitudes toward the sites were estimated from their attitudes and beliefs about water characteristics. The site attitudes were regarded as indicators of the quality of the respondents' recreation experience resulting from characteristics of the water. The major analyses were comparisons of the recreationist groups' perceptions of the water, attitudes toward water characteristics, the site attitudes held because of water characteristics, reports of decreased site use because of water characteristics, and reports of probable termination of site use because of water characteristics. The relationships between site attitude components resulting from selected water characteristics and the reports of decreased site use and probable termination of use were also investigated. The results indicated that the four types of recreationists differed in their perceptions of the water, attitudes toward water characteristics, site attitudes, and the reported water characteristics that had caused or might cause decreased site use. In addition to these

group differences, there were strong individual differences within the various groups. Site attitudes were not highly related to reported behavior.

INLAND PORT FACILITIES AND ECONOMIC GROWTH,
Mississippi State Univ., State College. Bureau of Business and Economic Research.
A. A. Armenakis, H. J. Moore, and G. T. Peden.
Available from NTIS as PB-195 166, $3.00 in paper copy, $0.95 in microfiche. Completion Report, October 1970. 78 p, 16 tab, 7 ref, append. OWRR Project A-032-MISS (1).

Descriptors: *Ports, *Economics, *Water transportation, *Input-output analysis, Mississippi, Economic prediction, Income, Costs.
Identifiers: Earnings (Monetary), *Economic growth.

Overall economic growth for each of three Mississippi inland port counties was compared to the aggregate of all non-port counties for the period 1959-1968. The measures selected were total personal income, total earnings, farm earnings, nonfarm earnings and manufacturing earnings. The role of each Mississippi inland port in economic growth was analyzed first by comparing the growth rates for Mississippi inland ports to other inland ports on the Mississippi River System during the period 1959-1968; and second, by studying the changes in commodity groups handled by each Mississippi inland port during the study period. On intra-port analysis of each Mississippi inland port provided the basis for concluding that the existence of each port made on important contribution to economic growth. An analysis of the relative contribution of each port in 1968 to its repective regional economy was performed by constructing partial input-output tables for each port county.

REPAYMENT INTEREST RATES FOR WATER PROJECTS,
Utah State Univ., Logan.
Daniel H. Hoggan.
Water Resource Research Vol 6, No 3, p 683-689, June 1970.

Descriptors: *Reimbursable costs, *Cost sharing, Financial feasibility, Cost allocation, Economic evaluation, Benefits, Discount rate, Risks.
Identifiers: *Repayment interest rate, Subsidy, Coupon rate, Opportunity costs.

Federal government policy with respect to the repayment interest rate has not been uniform. This interest rate is used to repay reimbursable costs of water projects and is related to the financial feasibility of a project. Usually the government has based its repayment interest rates on coupon rates of long term government bonds. The lack of a consistent government policy on repayment interest rates has resulted in subsidies to lower paying interest uses, namely municipal and industrial water users. The author also criticizes the inequality between interest rates used in benefit-cost analysis and those of repayment on the assumption that money should be paid back at the same rate as it is advanced. He suggests in order to develop uniformity, the government must examine repayment interest rates in conjunction with cost sharing and reimbursement. (Siegenthaler-Rutgers)

INCENTIVE PRICING AND UTILITY REGULATION,
Michigan Univ., Ann Arbor.
John G. Cross.
Quarterly Journal of Economics, Vol LXXXIV, No 2, p 236-253, May 1970. 4 fig.

Descriptors: *Pricing, *Prices, Utilities, Economics, Resource allocation, Average costs, Profit, Costs.
Identifiers: *Incentive pricing, *Utility regulation, Economic inefficiency, Public control, X-efficiency, Regulatory lag.

The author contends that in recent years economists have been growing increasingly concerned that their analyses of monopolistic behavior have overlooked a major source of economic inefficiency. In the past, emphasis has been placed almost entirely on the allocation of resources. It is now becoming apparent that an equal weight ought to be placed upon the mechanism of production itself, for it is quite possible that in our economy, inefficiency through the sheer wasting of resources is at least as important as that due to the improper allocation and distribution of goods and services. The author contends that the elimination of lax management, outdated production methods, and sloppy cost-control procedures would make a substantial difference in the value of a firm's operations. This possibility raises a serious problem in the area of utility regulation since it suggests that an important form of inefficiency has not been subjected to public control. The author discusses a device whereby one might deal with this problem--incentive pricing. This article has relevance to improving the management of water utilities. (Loeb-Rutgers)

RISK ALLOWANCE IN ORIGINAL CAPITAL INVESTMENTS,
Virginia Polytechnic Inst., Blacksburg.
D. L. Michelsen, Jr., and J. R. Snead.
The Engineering Economist Vol 15, No 3, p 137-157, Spring 1970.

Descriptors: *Risks, *Uncertainty, *Economic evaluation, Taxes, Capital, Costs, Investment, Value, Profits, Optimization, Discount rate, Time, Decision-making, Income.
Identifiers: *Discounted cash flow, *Depreciation, *Reuse value, Present worth, Operational cash flow.

The object of this paper is to consider the risks involved in an original capital investment, and how an economic evaluation might be adjusted for these varying capital risks. Particular attention is given to the effect of taxes and the adjustment of original capital risk as a function of potential reuse should the investment fail. A number of illustrations are given in order to indicate the original capital investment for risk. To give a better measure of risk capital the authors propose: (1) that the present worth of the guaranteed depreciation cash flow be discounted at the cost of capital and subtracted from the total initial investment, and (2) reducing the original risk capital by the amount of reuse value. The risks inherent in many water resource investments may be more effectively integrated into the economic evaluation through the use of these suggestions. (Murphy-Rutgers)

WATER AND SEWER FINANCIAL PLAN.
Chatham County-Savannah Metropolitan Planning Commission, Savannah, Ga.

Available from NTIS as PB-190 220, $3.00 in paper copy, $0.95 in microfiche. November 1969. 51 p.
Identifiers: *Urban planning, *Georgia, *Water supplies, Economics, *Economics, Sanitary engineering, Water pollution, Control, Sewage, Purification, Law, Construction, Population, Costs, Feasibility studies, Maps, *Chatham County (Ga), Sewage treatment, Taxes.

The Plan is a guide for financing needed improvements. The Plan recommends that Chatham County take over the responsibility for providing water and sewerage to the more densely developed portions of the County. The sewage treatment facilities to be financed by General Obligation Bonds backed by a countywide ad valorem tax, the sewage collection systems and water systems to be financed by Revenue Bonds backed by user charges. The Plan also presents an alternate method of financing, where communities wish to retain their own water and sewage collection systems. With this method, Chatham County would provide sewage treatment facilities financed by General Obligation Bonds backed by a countywide ad valorem tax, and Sewer Service Districts or municipalities to finance sewage collection systems through the use of property taxes or user charges, and that water system improvements be financed by currently operating water agencies.

STUDY OF WATER RESOURCES IN THE CHAD BASIN.
United Nations Educational, Scientific and Cultural Organization, Paris (France).

Nature and Resources, Vol 6, No 2, p 6-11, June 1970. 1 fig.

Descriptors: *Reservoir storage, *Water table, *Groundwater, *Watersheds (Basins), *Water resources, *Model studies, Mapping, Tracers, Water balance, Water levels, Water analysis, Planning, Hydrologic data, Hydrologic budget, Aquifers, Evaporation, Semiarid climates, Analog models.
Identifiers: *Africa, *Lake Chad, Chad basin.

The Chad basin is a closed hydrological system containing Lake Chad and a vast reservoir of groundwater. Four countries (Cameroon, Niger, Nigeria and Chad) with high population growth rates lie on the shores of the lake. A study conducted by the United Nations was designed to inventory water resources and discover hydrological mechanisms and relationships so that an integrated water policy might be planned by the nations involved. Tracer studies revealed no clear relationships between Lake Chad and the surrounding aquifers. A cartographic survey was made and maps were constructed on scales ranging from 1:50,000 to 1:5,000,000. Finally, an electric analog model was constructed to calculate the effects of drawoff on groundwater levels. The results were: (1) There is an almost uninterrupted water-table over 1,400,000 square kilometers, but with certain topographic anomalies; (2) An artesian aquifer may be present all around the lake, overlaying a second and deeper aquifer, but there is practically no recharge, thus calling for prudent use; (3) Surface water is much more plentiful than ground water; (4) Overall water balance figures show that evaporation totals over two-thirds of the output. (Casey-Arizona)

LINEAR PROGRAMMING MODEL FOR ESTIMATING THE AGRICULTURAL DEMAND FUNCTION FOR IMPORTED WATER IN THE PECOS RIVER BASIN,
New Mexico Univ., Albuquerque. Dept. of Economics.
Micha Gisser.
Available from NTIS as PB-194 785, $3.00 in paper copy, $0.95 in microfiche. Project Completion Report, July 1970. 13 p, 1 fig, 1 tab. OWRR Project No. 3109-33-A-022 N Mex (1).

Descriptors: *Water demand, *Systems analysis, *Economic prediction, *Planning, *Semiarid climates, Irrigation, Crops, Water allocation (Policy), Water costs, Water utilization, Water values, Semiarid climates, Model studies, Estimating equations, Linear programming, Constraints, Irrigation water, Agriculture.
Identifiers: *Pecos River Basin, Water importation.

A linear programming model of agricultural demand for imported water was developed for the Pecos Basin. The model utilizes agricultural activities and obtains agricultural demand functions for differing imported water prices and for local water use constraints. A constraint (L) indicates the highest per acre quantity of irrigation water farmers are allowed to use. The types of constraint incorporated into the model were salinity, legal, vegetables (greater than 20 percent production leads to oversupply), acreage and cotton (allotments). The basic assumptions of the model were: (1) Agricultural production can be divided into separate independent activities, (2) Each activity is governed by constant return to scale and fixed proportions, (3) Activities are divisible. The demand results are shown for L—3 at various local and imported water prices. (Casey-Arizona)

WATER FOR HOUSTON,
Turner, Collie and Braden Co., Inc., Houston, Tex.
Cecil H. Allen.
In: Water Resources Bulletin, Vol 6, No 2, p 189-192.

Descriptors: *Management, *Water distribution (Applied), *Water demand, *Water supply, Water sources, Industrial water, Municipal water, Groundwater, Surface runoff, Water quality, Engineering, Economics.
Identifiers: *Houston, Texas.

Houston, the Nation's sixth largest city, is taking appropriate steps to assure an adequate water supply to meet its municipal and industrial demands through the year 2000. A three-phase study entitled 'A Comprehensive Study of Houston's Municipal Water System' will be used as a master plan for both the domestic supply and the distribution system. Houston's situation is unusual because it now relies on groundwater sources for 80 percent of its domestic water supply, but must convert this system to depend on surface water for 60 percent of its total supply source. Problems concerning the conversion are complex. Surface water is more costly. Reservoirs that meet the plans and standards of state and federal water authorities as well as conveyance and treatment facilities must be developed. The total groundwater withdrawal rate must be increased but at the same time shifted from one area to another because of subsidence problems. Solutions to these problems require careful engineering study as well as economic and sociological planning. The plan calls for operation of three water treatment plants linked to the distribution system by means of low-pressure arterial mains which in turn will supply booster pump stations located throughout the city. The low pressure groundwater supply will be linked to the low pressure surface water supply allowing for controlled dependence on each water source according to seasonal conditions. Identifiers: *Hydrologic atlas, *Water use inventory.

Major uses and types of water are shown by color bars on a map scaled 1 inch equals 30 mi. The map report portrays where the largest quantities of fresh water for each major category of use are withdrawn. Estimates are given of the quantity of saline water circulated through thermoelectric power generating plants for cooling, 75% of which is from surface sources. Trends in water use, based on five-year estimates since 1950, are shown graphically, and a table gives total water use by type of use and source. Irrigation showed the most significant increase of the types of water use for the 1960-65 period. During 1965, 510,000 acre-ft of surface water and 650,000 acre-ft of groundwater were used on 490,000 acres of citrus crops; 260,000 acres of truck crops required 540,000 acre-ft of surface and 250,000 acre-ft of groundwater; and 500,000 acres of sugar cane, pasture and other crops were irrigated with 1,170,000 and 420,000 acre-ft, respectively, of surface and groundwaters. ADIRONDACK POWER AND LIGHT CORP V CITY OF LITTLE FALLS (RIPARIAN RIGHT TO UNALTERED RIVER'S FLOW).

148 Misc 191, 265 NYS 567-596 (1930).

Descriptors: *New York, *Riparian rights, *Natural flow doctrine, *Alteration of flow, Riparian land, Riparian waters, Competing uses, Diversion, Electric power, Municipal water, Obstruction to flow, Reasonable use, Relative rights, Judicial decisions, Rivers, River flow, Flow, Regulation, River regulation, Dams, Reservoirs, Water consumption, Consumptive use, Water utilization, Cities.

Plaintiff utility, a riparian landowner, brought an action against defendant municipality for damages caused by diversion of a river's waters from plaintiff's power plants. Plaintiff also sought an injunction to restrain such diversion. Plaintiff contended that as a riparian owner, it had the right to the river's flow past its premises in its natural course without diminution or obstruction thereto. Defendant contended that it had been granted the right to divert the waters of the river for consumptive municipal purposes by plaintiff's predecessor in title. The court construed the grant-in-title and held that defendant's right was subject to the restriction that it maintain the normal and natural flow of water by the use of regulatory reservoirs. Defendant had failed to construct and use such reservoirs, and consequently the conditions of the grant had not been met. Therefore, defendant was liable in damages to plaintiff for diverting the river's waters. Furthermore, such diversion constituted a continuing trespass upon plaintiff's water rights for which an injunction would lie. (Snow-Florida)

REPORT OF THE UNITED STATES DELEGATION TO THE SIXTH SESSION OF THE COORDINATING COUNCIL OF THE INTERNATIONAL HYDROLOGICAL DECADE, UNESCO GENEVA, SWITZERLAND, JULY 6-11, 1970.

International Hydrological Decade-UNESCO Report of 6th Session Coordinating Council, Geneva July 6-11, 1970. 22 p, 2 append.

Descriptors: *International Hydrological Decade *Conferences, Programs, Project planning Hydrology, Research and development, Projects Scheduling, United Nations.
Identifiers: UNESCO.

The report of the U. S. Delegation to the 6th session of the Coordinating Council of the International Hydrological Decade, UNESCO, presented. Most of the Sixth Session of the Council was devoted to discussions of the working group which are to be operative during the final half of the International Hydrological Decade. The U

Delegation went to the Sixth Session hoping to influence the Council to (1) reduce the number of working groups, and (2) simplify their terms of reference to include only priority items which can be achieved during the last half of the Decade. The Delegation was not successful in achieving either one of these objectives to a significant degree. (K-napp-USGS)

BRESHERS V NINETEENTH LA LEVEE DIST (DAMAGES RECOVERABLE FOR INJURY CAUSED BY LEVEE CONSTRUCTION).

65 So 494 (La Ct App 1936).

Descriptors: *Louisiana, *Eminent domain, *Compensation, *Levees, Judicial decisions, Legal aspects, Drainage, Cultivated lands, Land tenure, Leases, Damages, Drainage effects, Crops, Real property, Administrative agencies.

Plaintiff sought to recover damages for the destruction of his growing crops caused by the construction of a levee by defendant levee district. The court held that the Louisiana constitution allows compensation for lands and improvements actually used or destroyed for levee purposes, but no such compensation is allowed for the destruction of growing crops. Consequently, the trial court's judgment for defendant was affirmed. (Price-Florida)

WHEATLEY V CITY OF FAIRFIELD (DAMAGES CAUSED BY IMPOUNDED WATERS).
10A
264 NW 906-915 (Iowa 1936).

Descriptors: *Iowa, *Condemnation, *Flood damage, *Impounded waters, Administrative decisions, Boundaries (Property), Community development, Eminent domain, Judicial decisions, Land tenure, Legal aspects, Local governments, Proprietary power, Public rights, Riparian land, Riparian rights, Relative rights, Watercourses (Legal), Damages, Flooding, Impoundments, Dams, Reservoirs, Streams, Adjudication procedure, Remedies.
Identifiers: *Res judicata.

Defendant city erected a dam downstream from plaintiff's property. Water impounded thereby flooded plaintiff's land. Plaintiff brought action for damages and equitable relief. Before the case reached trial, defendant initiated condemnation proceedings against the flooded portion of plaintiff's land. The two suits were consolidated for trial. In the condemnation proceedings, plaintiff offered proof only as to the before and after value of the land, and was granted an award based thereon. The judgment directed defendant to pay the award or be enjoined from any use of the dam and the waters impounded thereby. Defendant then abandoned the condemnation proceeding and drained plaintiff's land. Plaintiff then sought an award for depreciation in rental value and damages to the land caused during the 3 year period in which defendant operated the dam. The court held that the issue of damages was res judicata in that an adjudication is final not only as to the matter actually determined, but as to every other matter the parties might have litigated which was essentially connected to the subject matter of litigation. Plaintiff's failure to prove these damages at trial barred any further action. (Clarke-Florida)

CITY OF CORAL GABLES V CRANDON (ESTABLISHMENT OF WATER CONSERVATION DISTRICT).

25 So 2d 1-3 (Fla 1946).

Descriptors: *Florida, *Cities, *Public benefits, *Water conservation, Municipal water, Local governments, State governments, Legislation, Water supply, Water table, Water yield improvement, Water quality, Salinity, Water pollution, Saline water, Infiltration, Saline water intrusion, Legal aspects, Judicial decisions, Water policy, Water management (Applied).

Plaintiff city brought action to enjoin the enforcement of a state act relating to the creation of water conservation districts in counties having a population of greater than 260,000. Plaintiff argued the act should be struck down since it was in effect a local law in that only Dade County contained such a large population. Plaintiff contended that such a law was invalid under the Florida constitution. The supreme court rejected the contentions, holding that the law had a reasonable basis in the subject regulated. The court took judicial notice of the fact that several other counties were approaching the 260,000 mark. The court also recognized that providing an ample supply of fresh water in Dade County had become a serious problem with population increases, increased consumption, excessive runoff problems and salt water invasion of fresh water areas. The object of the statute to restore fresh water levels was not prohibited by any constitutional barriers. (Hubener-Florida)
W71-00062

JEFFERSON REALTY CO V BD OF COMM'R OF EVERGLADES DRAINAGE DIST (VALIDITY OF DRAINAGE DISTRICT TAXES ON SOVEREIGN LANDS).
23 So 2d 274-276 (Fla 1945).

Descriptors: *Florida, *Ownership of beds, *Taxes, *Land reclamation, Meanders, Beds, Assessments, Land use, Land tenure, Land classification, Drainage districts, Land development, Boundaries (Property), Legal aspects, Judicial decisions, Lakes, Legislation, State governments, Local governments, Relative rights.
Identifiers: *Sovereignty lands.

In 1925 the Trustees of the Internal Improvement Fund conveyed to plaintiff's predecessor in title certain sovereignty lands underlying Lake Okeechobee. The state contracted with the vendee for the reclamation of the lands, which was accomplished by 1935. In 1927 and thereafter the county tax assessor placed the lands on defendant drainage district's tax rolls and made certain assessments. Plaintiff declined to pay such assessments, and brought suit to determine their validity. Defendant contended that on reclamation the lands became subject to taxation pursuant to an omnibus clause in a state act authorizing drainage district taxes on 'all other lands', i.e. lands not falling within certain prescribed categories in drainage districts. The Florida Supreme Court, in holding for plaintiff, stated that no basis existed for taxing the reclaimed lands. The omnibus phrase applied to land remote from drainage works and not to sovereignty lands below the meander line of the lake. (Hubener-Florida)
W71-00074

IDEAL FARMS DRAINAGE DIST V CERTAIN LANDS (PUBLIC POLICY ON DRAINAGE DISTRICT ASSESSMENTS).

19 So 2d 234-240 (Fla 1944).

Descriptors: *Florida, *Drainage districts, *Taxes, *Assessments, Public benefits, Public health, Social aspects, Legal aspects, Judicial decisions, Canals, Ditches, Dams, State governments, Local governments, Legislation, Swamps, Marshes, Overflow, Relative rights, Adjudication procedure.

Plaintiff drainage district brought suit to foreclose a lien for drainage taxes. Defendant interposed a defense of a three year statute of limitations on the theory that the tax was a liability created by statute. The trial court held for defendant and the supreme court affirmed. On rehearing the supreme court reversed. The court held that the state had the power to authorize or require local improvements to promote public health and welfare and to provide for canals, drains and drainage districts to implement such purposes. Where one statute provided that delinquent taxes constituted a lien until paid and another provided that actions on liens must be brought within three years, it was the court's duty to define a reasonable field of operation for the statutes, to harmonize them and to effect legislative purposes. Since laws affecting public policy and general welfare should be given liberal construction, the court held the three year limitation inapplicable in the instant case. (Hubener-Florida)
W71-00075

REALTY OPERATORS, INC V STATE MINERAL BD (OWNERSHIP OF LAKE BED).
202 La 398, 12 So 2d 198-203 (1942).

Descriptors: *Louisiana, *Ownership of beds, *Patents, *Navigable waters, Non-navigable waters, Lakes, Land tenure, Leases, Exploitation, Mineralogy, Legislation, Legal aspects, Judicial decisions, State governments, Surveys, Beds under water, Land reclamation, Relative rights, Boundaries (Property), Administrative agencies, Remedies.

Plaintiff sought an injunction to prevent the State Mineral Board from granting a mineral lease to the bed of a certain lake. Plaintiff claimed ownership of the lake and its bed by patents acquired at a sheriff's sale. Plaintiff averred that the lake was non-navigable and that it had enjoyed possession of such lake for 20 years. Defendant contended that the lake had formerly been navigable and that title to the bed remained vested in the state and could not have been conveyed by the patents. The Louisiana Supreme Court affirmed the trial court's permanent injunction against issuance of the lease. The court treated the case as an action to establish title rather than protect possession. The court held that the patents covered the bottom of the lake in question. Defendant's right to question the validity of the patents had been foreclosed by failure to file suit within six years of the enactment of an act which made patents issued to beds of lakes or other waterbodies subject to annulment. (Hubener-Florida)

MISSISSIPPI STATE HIGHWAY COMM'N V HUDGINS (EVALUATION OF PROPERTY TAKEN BY CONDEMNATION).
181 So 719-720 (Miss 1938).

Descriptors: *Mississippi, *Condemnation value, *Compensation, *Evaluation, Eminent domain, Judicial decisions, Legal aspects, Reservoirs, Springs, Spring waters, Local governments, Real property, Property values, Administrative agencies, Condemnation.

In a condemnation proceeding by plaintiff commission, an award was granted to defendant which included not only an amount for the value of the property, taking into consideration that a spring fed into it, but also an additional amount for the alleged value of the spring. From this award, plaintiff appealed. The court held that in such a proceeding it is not proper, after awarding full damages for property taken, to then allow additional compensation for those things without which the property would have had a lesser value. Thus it was error to allow an additional amount for the value of the spring. The judgment was affirmed with remittitur. (Price-Florida)
W71-00079

MISSISSIPPI STATE HIGHWAY COMM'N V YELLOW CREEK DRAINAGE DIST (BRIDGE CONSTRUCTION ENJOINED AS BEING IN-

TERFERENCE WITH MAINTENANCE OF DRAINAGE DISTRICT).
180 So 749-752 (Miss 1938).

Descriptors: *Mississippi, *Drainage districts, *Bridge construction, *Competing uses, Eminent domain, Drainage, Drainage practices, Drainage programs, Drainage systems, Canals, Bridge design, Piers, State governments, Highways, Cultivated lands, Public benefits, Right-of-way, Easements, Obstruction to flow, Overflow, Judicial decisions, Legal aspects, Relative rights.

Plaintiff highway department sought to restrain defendant drainage district from interfering with the construction of a bridge by plaintiff across a canal which was part of a drainage system maintained by defendant. Plaintiff, in a cross-bill filed by defendant, was restrained from constructing said bridge. On appeal plaintiff alleged the bridge was being built in the same place a previous bridge had been, that it was being properly constructed and that it was causing no more obstruction in the canal than existed previously. Defendant alleged that the bridge was being improperly constructed and that increased obstruction to the canal would result due to plaintiff's placing of piers in the canal. The court confirmed the lower court's findings that the bridge as constructed would collect drift and damage agricultural land in the district. Both parties had powers of eminent domain. Defendant owned the right-of-way through which the canal ran. Property already devoted to public use may be again taken or damaged for public use if the public interest is served and the prior use is not materially impaired. Here, both public purposes, highway construction and the maintenance of drainage districts, could be served without significant damage to either if no piers were placed in the canal. The judgment for defendant was affirmed. (Price-Florida)

STATE V STOUTAMIRE (RIGHT OF PEOPLE TO TAKE FISH FROM PUBLIC WATERS OF THE STATE).
179 So 730-734 (Fla 1938).

Descriptors: *Florida, *Fish conservation, *Fishing, *Public rights, Legislation, State governments, Public benefits, Freshwater fish, Fish, Fish behavior, Judicial decisions, Legal aspects, Regulation, Supervisory control (Power), Relative rights.

The Florida legislature had passed a law prohibiting the taking of fish from a certain one half mile length of a fresh water river in Northwest Florida. Plaintiff, in a habeas corpus proceeding, contended that the law was local or special in nature and as such was invalid since its passage had failed to comply with Florida constitutional requirements pertaining to such laws. Defendant sheriff contended that the law was a general law. The court stated that the right of the state in the fish of public waters is a sovereign right of preservation, conservation and regulation, but not an absolute right such as the state has in its proprietary property. The people have a right to take fish from public waters subject to such regulation. The court held the statute in question was a special law, the passing of which had not met certain constitutional requirements. Consequently the statute was invalid and could not be enforced. (Price-Florida)
W71-00082

HENRITZY V HARRISON COUNTY (RIGHT OF WAY SECURED VIA CONDEMNATION FOR SEA WALL CONSTRUCTION).
178 So 322-327 (Miss 1938).

Descriptors: *Mississippi, *Sea walls, *Right-of-way, *Condemnation, Eminent domain, Local governments, Easements, Landfills, Compensation, Judicial decisions, Legal aspects, Legislation, Damages, Adjudication procedure, Washouts, Surveys.

Defendant had been required to remove a concrete structure from a right-of-way which had been secured by plaintiff county for the construction of a sea wall which was designed to protect a highway from storm damage. Defendant contended the condemnation proceeding through which the right-of-way had been secured had been unconstitutionally conducted. The court found that the procedure for condemnation had been followed properly, and that the statute of limitations was a bar to any claim for damages by defendant if he in fact had ever had a right to such claim. The trial court's judgment for plaintiff was affirmed. (Price-Florida)
W71-00083

STUART V DETROIT FINNISH COOPERATIVE SUMMER CAMP ASS'N (INTERFERENCE WITH WATER LEVEL).
277 Mich 144, 269 NW 122-124 (1936).

Descriptors: *Michigan, *Riparian rights, *Dams, *Water levels, Legal aspects, Judicial decisions, Water law, Backwater, Overflow, Water level fluctuations, Water, High water mark, Lakes, Obstruction to flow, Prescriptive rights, Reasonable use, Recreation, Natural flow doctrine, Competing uses, Relative rights, Riparian waters, Riparian land.

Defendant association's property surrounded a lake containing a spring whose waters flowed into a chain of small lakes some three-quarters of a mile distant. Plaintiffs, who owned land on the chain of lakes, built a dam which raised the level of defendant's lake 1 1/2-2 feet. When defendant began to construct a drain to lower the water level, plaintiffs brought action to enjoin such construction. Defendant then filed a cross-bill seeking to enjoin plaintiffs' maintenance of their dam so as to raise the water level of its lake. Defendant contended that plaintiffs could not construct a dam which interfered with defendant's enjoyment of its property. Plaintiffs contended that defendant was barred by laches because it allowed construction of the dam and subsequent development of surrounding property without complaint. The court held that plaintiffs had not acquired a prescriptive right to operate a dam because their dam had not been in existence the requisite period of years. Mere passivity by defendant, in the absence of a duty to speak, did not stop it from complaining when the actions of plaintiffs interfered with its enjoyment of its property. The court enjoined plaintiffs from raising the water in defendant's lake beyond its original level. (Dye-Florida)
W71-00084

CITY OF NEW LISBON V HAREBO (CONDEMNATION PROCEDURE FOR DAM CONSTRUCTION).
271 NW 659-664 (Wis 1937).

Descriptors: *Wisconsin, *Condemnation, *Eminent domain, *Local governments, Legislation, Judicial decisions, Legal aspects, Dams, Political aspects, Damsites, Backwater, Damages, Flow, Recreation, Public benefits, Public lands, Cities, Navigable waters, Artificial use, Rivers, Streams, Ponds, Lakes, Reservoirs, Permits.

Petitioner city sought to condemn property for construction of a dam and reservoir to be used as a recreational park. Respondent landowners demurred on the grounds that: (1) the public necessity for condemnation was not shown; and (2) the petition did not allege that a permit had been obtained for construction of the dam. Petitioner contended that a permit could not be obtained until the property to be flowed was acquired, since applicants for permits must show that no property damage will result from dam operation. The Supreme Court of Wisconsin ruled for respondent, stating that property damage contemplated by regulations governing issuance of permits is damage in time of flood, not normal flowage. Property may not be condemned until the public purpose for which it is being acquired is shown to be legal and imminent. Without a permit, construction of the dam would be illegal and the public purpose could not be effectuated. The court also found the petition defective in not alleging why it was necessary to condemn the particular property involved. (Dye-Florida)
W71-00085

WARREN V GEORGIA POWER CO (LIABILITY FOR FLOOD DAMAGE CAUSED BY BACKWATER FROM DAM).
197 SE 338-342 (Ga Ct App 1938).

Descriptors: *Georgia, *Hydroelectric plants, *Backwater, *Flood damage, Dams, Compensation, Damages, Remedies, Legislation, Condemnation, Eminent domain, Cultivated lands, Public utilities, Rivers, Drainage, Ditches, Silts, Sediments, Riparian land, Riparian rights, Public rights, Legal aspects, Judicial decisions, Adjudication procedure.
Identifiers: Nuisance.

Plaintiff landowner brought a nuisance action against defendant power company for damages to plaintiff's land allegedly caused by the backwater from defendant's dam. Plaintiff contended that defendant negligently operated and maintained the dam and caused the river to fill with silt and sediment, thereby impairing the drainage of plaintiff's land and rendering it unfit for cultivation and diminishing its rental value for the previous four years. Defendant contended that the evidence failed to disclose any negligence on defendant's part, and that the damage to plaintiff's land was permanent and had occurred more than four years ago; therefore, plaintiff's action was barred by the statute of limitations. Affirming a judgment of nonsuit, the court held that the evidence showed a taking and damaging of the property for public use rather than a continuing nuisance, but plaintiff could not recover the just compensation to which he was entitled for such a taking in a nuisance action. Further, the court noted that where damage is of a permanent nature, an action for continuing nuisance is improper and can be barred by the statute of limitations. (Liptak-Florida)
W71-00086

SATREN V HADER CO-OPERATIVE CHEESE FACTORY (ABATEMENT OF NUISANCE CAUSED BY DISCHARGE OF INDUSTRIAL WASTE).

279 NW 361-364 (Minn 1938).

Descriptors: *Minnesota, *Water pollution sources, *Pollution abatement, *Industrial wastes, Water pollution, Judicial decisions, Legal aspects, Legislation, Pollutants, Riparian rights, Wastes, Decomposing organic matter, Sewage, Streams, Dairy industry, Milk, Path of pollutants, Water pollution control, Water pollution effects, Abatement, Industrial plants, Industrial water.

Defendant operated a cheese factory, dumping sewage and whey into a creek which flowed adjacent to his property and through plaintiff's property. Plaintiff brought action to enjoin such dumping. A trial court adjudged the dumping a nuisance and enjoined defendant from dumping sewage and whey. On appeal, defendant contended that: (1) regulation of water pollution is the State Board of Health's responsibility, not the courts; and (2) plaintiff's damages ($63 a year) were too insignificant to warrant an injunction. Plaintiff contended that the statute giving the Board of Health authority over water pollution does not prevent the courts from abating private nuisances under prior statutes. The Supreme Court of Minnesota affirmed, ruling that the cheese factory had obtained no prescriptive right to dump whey because its dumping was neither continuous nor homogeneous for the required time period. The insignificance of the damage to plaintiff was immaterial to issuance of an injunction. However, only that activity which was shown to have been injurious to plaintiff, the

dumping of whey, could be enjoined. The trial court's injunction was modified to that effect. (Dye-Florida)
W71-00087

KELLOG V HOTTMAN (INTERFERENCE WITH FLOW OF FLOODWATERS).
286 NW 415-417 (Iowa 1939).

Descriptors: *Iowa, *Flood protection, *Flood routing, *Dikes, Judicial decisions, Legal aspects, Flood control, Diversion, Diversion structures, Levees, Flooding, Rivers, River flow, Floods, Floodwater, Running waters, Streams, Obstruction to flow, Alteration of flow, Arable land, Missouri River, Repulsion (Legal aspects).

Plaintiff's property was surrounded on three sides by dikes of his own construction which prevented the waters of the Missouri River from inundating his land in time of flood. On the fourth side ran an elevated road. Defendant landowners constructed a dike along a portion of this road, and at a somewhat higher level, for the purpose of diverting the course of floodwaters. Plaintiff complained that the new construction would raise the level of floodwaters around his property and would prevent waters which entered his property from escaping. A lower court denied plaintiff's request for an injunction restraining construction of defendant's dike. The Supreme Court of Iowa affirmed. The evidence did not support plaintiff's allegation of interference with the course of floodwaters around plaintiff's property. Plaintiff's dike had been sufficient to protect his land from flood waters for years and there was no proof of the possibility of an extraordinary flood in the foreseeable future. (Dye-Florida)
W71-00089

ARND V HARRINGTON (TITLE BY ACCRETION VERSUS TITLE BY ADVERSE POSSESSION).
287 NW 292-296 (Iowa 1939).

Descriptors: *Iowa, *Land tenure, *Accretion (Legal aspects), *Prescriptive rights, Boundaries (Property), Boundary disputes, Missouri River, Adjudication procedure, Judicial decisions, Jurisdiction, Rivers, Interstate rivers, Bank erosion, Evulsion, Real property, Water rights, Remedies, Legal aspects, Riparian land, Riparian rights, State jurisdiction.

Plaintiff and defendant both claimed title to land created by accretion along the Missouri River. Plaintiff sued defendant for trespass, asking for an injunction to prevent defendant's interference with his use of the land and for damages. Defendant cross-claimed to quiet title and also sought a similar injunction. Plaintiff claimed title by adverse possession. Defendant claimed title by accretion formed by the changing course of the Missouri River, and argued that the complaint erroneously described the land as being in Nebraska when it actually was located in Iowa. Affirming a judgment for plaintiff, the court held that the evidence clearly established title in plaintiff by adverse possession. As to the description of the land, the court found that there was no question as to the identity of the tract in controversy and, although state boundaries may change as a result of accretion, the court has jurisdiction as long as the land is actually within the state at the time and all the parties are before the court. (Liptak-Florida)
W71-00090

CITY OF MILWAUKEE V PUBLIC SERVICE COMM'N (ADMINISTRATIVE ORDER TO SUPPLY WATER).
287 NW 682-683 (Wis 1939).

Descriptors: *Wisconsin, *Administrative decisions, *Community development, *Water supply, Equitable apportionment, Judicial decisions, Legal aspects, Local governments, Preferences (Water rights), Public benefits, Relative rights, State governments, Water rights, Public utilities, Public utility districts, Conduits, Remedies.

Defendant Public Service Commission entered an order granting authority to defendant Town of Greenfield to construct water mains which would ultimately allow the Town of Greenfield to obtain its water from defendant City of West Allis. Plaintiff City of Milwaukee brought this action to set aside said order, contending that it furnished water to the City of West Allis, and if the plans were carried out, the necessary water might ultimately be supplied by plaintiff. The court dismissed the action, holding that the mere construction of the water mains was no concern of the plaintiff. If and when the Public Service Commission ordered the City of West Allis to supply water to the Town of Greenfield, plaintiff would have standing to bring an action. (Clarke-Florida)
W71-00091

DETROIT TRUST CO V DINGMAN (AUTHORITY OF DRAINAGE DISTRICTS TO ALLOW INCIDENTAL SEWAGE DISPOSAL THROUGH DRAINAGE SYSTEM).
291 Mich 170, 289 NW 118-122 (1939).

Descriptors: *Michigan, *Drainage systems, *Drains, *Sewage disposal, Judicial decisions, Legislation, Legal aspects, Drainage, Subsurface drainage, Surface drainage, Drainage programs, Multiple-purpose projects, Surface waters, Drainage districts, Governments, Sewers, Conduits, Administration, Local governments, Sewage, Drainage water, Surface runoff, Drainage engineering, Drainage practices.

Drains disposing of surface water and sewage were constructed in a drainage district where plaintiffs were taxpayers. Plaintiffs sought an injunction restraining defendant drainage district from assessing drainage taxes to pay for construction of the drains on the grounds that the drainage structures were sewers and not within the authority of the drainage district to construct. The lower court ruled for plaintiffs. The Supreme Court of Michigan reversed, stating that a structure may retain its character as a drain though incidentally disposing of sewage. Testimony showed that the structure in the instant case were designed on the basis of the volume of runoff water flow and only incidentally to dispose of sewage. Michigan statutes allow the incidental use of drains for sewage disposal. Location of parts of the drain beneath the ground did not change its character. (Dye-Florida)
W71-00092

WHITE V WELSH (AUGMENTATION OF UTILITY CAPACITY).
291 Mich 636, 289 NW 279-281 (1939).

Descriptors: *Michigan, *Legislation, *Water supply, *Water sources, Judicial decisions, Legal aspects, Cities, Pipes, Lakes, Inter-basin transfers, Pipelines, Water conveyance, Water delivery, Public utilities, Facilities, Local governments, Administration, Conduits, Utilities, Water works, Water distribution (Applied), Regulation.

Plaintiff taxpayers sought to restrain defendant city of Grand Rapids from constructing a water pipe to Lake Michigan to transport water to the city's water system. Plaintiffs contended that the construction would violate a statute prohibiting acquisition by a city of a public utility without consent of the electors. The lower court dismissed the complaint, saying that the pipeline construction was an extension of an existing utility rather than the acquisition of a new one. The Supreme Court of Michigan affirmed, citing as authority a previous case in which a city was allowed to purchase a complete power plant to augment existing power sources. In the instant case the proposed construction was a pipeline whose only use was to be in conjunction with the existing city water system. Consequently, defendant had not violated the statute. (Dye-Florida)
W71-00093

KUEHN V VILLAGE OF MAHTOMEDI (CONFLICT BETWEEN PUBLIC AND PRIVATE OPERATORS OF WATER SYSTEMS).
292 NW 187-191 (Minn 1940).

Descriptors: *Minnesota, *Community development, *Local governments, *Public rights, Equitable apportionment, Human population, Judicial decisions, Legal aspects, Permits, Relative rights, Third party effects, Water transfer, Potable water, Pipes, Pipelines, Municipal water, Water supply, Water distribution (Applied).
Identifiers: *Dedication, *Negligence.

Plaintiff constructed a water plant and pipes for the purpose of selling water to private customers. Several years later, defendant village of Mahtomedi was incorporated, following which defendant constructed its own water plant and lines, many of which paralleled plaintiff's. Plaintiff sued for damages, alleging three grounds: (1) the mere establishment of his water system constituted a perpetual franchise by statute; (2) a plat describing a dedication of a section of the town reserved to him the exclusive right to lay and maintain water pipes in that section; and (3) defendant negligently damaged his pipes. The court held as to the first contention that the statute in question concerned the use of public roads for enterprises developing water power. Plaintiff's business of selling water was not included within the scope of the statute. Secondly, the court held that a dedicator of land may not attach to the dedication limitations which remove the land from public control. Such limitations are void as against public policy. As to the third contention, the statute of limitations for filing negligence actions against a municipality had run. (Clarke-Florida)
W71-00094

VANDREUIL LUMBER CO V EAU CLAIRE COUNTY (CONDEMNATION OF FLOWED LANDS).

239 Wis 538, 2 NW2d 356-362 (1942).

Descriptors: *Wisconsin, *Eminent domain, *Dams, *Condemnation, Judicial decisions, Legal aspects, Legislation, Recreation, Reservoirs, Taxes, Governments, Federal government, Local governments, Government finance, Flow, Flooding, State governments, Administration, Administrative decisions, Real property.

Defendant county constructed a dam which, in operation, flowed plaintiff corporation's property. Subsequent to the dam's construction, a statute was enacted empowering the county to condemn property which was to be flowed by dams constructed under county-sponsored work projects. Plaintiff objected to the condemnation of its land because: (1) enactment of the condemnation statute was after construction of the dam which flowed its land; and (2) administrative requirements for condemnation had not been fulfilled. Defendant contended that the statute applied to any dam, regardless of when constructed. The Supreme Court of Wisconsin found for defendant, and held that all procedural requirements for condemnation had been compiled with. The fact that defendant was acquiring some flowed lands by lease did not require it to acquire all land that way. A county may use whatever means it deems most efficient to acquire flowed lands. (Dye-Florida)
W71-00095

LAGE V POTTAWATTAMIE COUNTY (FLOOD DAMAGE RESULTING FROM PUBLIC ACTIVITY).
5 NW2d 161-167 (Iowa 1942).

Descriptors: *Iowa, *Flooding, *Eminent domain, *Local governments, Judicial decisions, Legislation, Legal aspects, Flood damage, Condemnation, Dikes, Banks, Highways, Embankments, Road-

banks, Drains, Levees, Drainage districts, Governments, State governments, Floods, Cost allocation, Property values, Land forming, Compensation.

Plaintiff's property was damaged by intermittent flooding caused by defendant county's cutting of the banks and dikes of a drainage ditch. The bank cutting was done in the course of the purchase of fill dirt from plaintiff by defendant for the purpose of raising the level of a state highway which ran adjacent to plaintiff's property. Plaintiff alleged that the flooding of his property was a taking by government of his property without just compensation. Plaintiff claimed to be entitled to the value of his property before flooding. The Supreme Court of Iowa held that where a public structure necessarily leads to the flooding of private land, there is a taking of property requiring compensation. That defendant was performing a duty in improving the highway did not relieve defendant of responsibility. Payment for the fill dirt did not contemplate further damage to plaintiff's property and was not compensation for such damage. (Dye-Florida)

CITY OF MILWAUKEE V PUBLIC SERVICE COMM'M (PUBLIC UTILITIES REGULATION).
5 NW2d 800-804 (Wis 1942).

Descriptors: *Wisconsin, *Public utilities, *Local governments, *Water supply, Judicial decisions, Legislation, Legal aspects, Governments, Utilities, Public utility districts, Water distribution (Applied), Administration, Institutions, Regulation, Water works, Water rates, Cities, Water demand, Water management (Applied), Administrative agencies, Administrative decisions.

Plaintiff city operated a water works utility. By contract with defendant town the city agreed to supply water to a limited portion of the town. Defendant Public Service Commission ordered the city to extend service to the remainder of the town on the theory that by servicing part of the town it had become a utility for the entire town under the direction of the Commission. The trial court held for the Commission. The Supreme Court of Wisconsin reversed. The issue was whether a municipal utility, by accepting a contract to service a limited area of a town, becomes a utility for the entire town. Plaintiff, by extending its service, became a utility outside the city only to the extent of its contract. Plaintiff could be required to continue to service the area contracted for, but could not be required to extend its services to the entire town. (Dye-Florida)
W71-00098

STATE EX REL PETERSON V BENTLEY (COMPENSATION FOR TAKING OF PRIVATE PROPERTY REQUIRED).
12 NW2d 347-359 (Minn 1943).

Descriptors: *Minnesota, *Eminent domain, *Compensation, *Flooding, Condemnation, State governments, Governments, Legislation, Judicial decisions, Legal aspects, Political aspects, Dams, Jurisdiction, State jurisdiction, Flow, Reservoirs, Standing waters, Backwaters, Administration, Administrative decisions, Damages, Flood damage, Dam construction.

Petitioners sought to intervene in a suit brought by the state to condemn lands to be used for a dam and reservoir. Petitioners claimed that their land would be flooded by the proposed dam to the extent of a taking by the state, and sought just compensation for the property. The state claimed that petitioners were improper parties to the action. The Supreme Court of Minnesota found for petitioners. The state may take private lands only for a public use and only after paying just compensation. Flooding of private property is a taking and requires compensation. The amount of compensation is a judicial question. It is immaterial that insufficient funds were appropriated by the legislature to compensate petitioners. Compensation must be made. The court in its discretion may allow petitioners to intervene even though they have not fulfilled the requirements of the intervention statute. Where the state has not changed its position in reliance on petitioners' inaction, laches does not apply. (Dye-Florida)
W71-00106

MCCAULEY V SALMON (RELATIVE RIGHTS OF RIPARIAN OWNERS AND THE PUBLIC ALONG NAVIGABLE WATERS).
14 NW2d 715-716 (Iowa 1944).

Descriptors: *Recreation, *Iowa, *Riparian rights, *Navigable waters, Judicial decisions, Navigable rivers, Bodies of water, Rivers, Streams, Boundaries (Property), River beds, Ownership of beds, Riparian waters, Legal aspects, Streambeds, Boats, Boating, Water sports, Reasonable use, Competing uses, Relative rights, Riparian land, Watercourses (Legal), Navigation.

Defendants operated motorboats on a river. Plaintiff owned lands along the river and sought to enjoin as a nuisance the operation of boats on the river with unreasonable noise and at high speeds. The river adjacent to plaintiff's property was a navigable stream deepened by a dam constructed with the consent of riparian owners. Its primary use was recreational and boats operating on the river were licensed by the state. The trial court granted relief as to noise but not as to speed. The Supreme Court of Iowa affirmed. Riparian owners own only to the high water marks of navigable streams. The right of the public to navigate such streams is paramount, including rights of boating and other sports. The shores are subject to dangers incident to reasonable exercise of the navigation right. Damages resulting from such reasonable navigation must be borne by the owners of riparian land. So long as boats navigating the river did not exceed the statutory speed limit, no regulatory action would be taken. (Dye-Florida)
W71-00109

JOHNSON V STARR (NEGLIGENT DAM CONSTRUCTION).
191 SE 874-875 (Ga Ct App 1937).

Descriptors: *Georgia, *Dam failure, *Flood damage, *Impounded waters, Dams, Storm drains, Boundaries (Property), Judicial decisions, Land tenure, Legal aspects, Relative rights, Riparian land, Riparian rights, Riparian waters, Streams, Remedies, Damage, Overflow, Flooding, Construction, Dam construction.

Defendant constructed an earthen dam across a stream flowing through his land. There were no storm drains installed therein. During a heavy rain, the dam collapsed. Plaintiff claimed that his land was flooded by the overflow of the stream caused by the breaking of the dam, and brought action to recover for damages caused by such flooding. Defendant admitted all the facts but contended that plaintiff's land was already flooded when the dam broke. The trial court placed the burden of proof on defendant as to his nonnegligence in constructing the dam. The appellate court reversed, holding that the burden was on plaintiff to sustain his allegations of negligence. (Clarke-Florida)
W71-00126

FINSETH V SPERRY (MAINTENANCE OF DRAINAGE SYSTEMS).
17 NW2d 499-502 (Minn 1945).

Descriptors: *Minnesota, *Drainage districts, *Cost allocation, *Local governments, Judicial decisions, Legal aspects, Legislation, Drains, Costs, Cost sharing, Maintenance costs, Financing, Drainage, Governments, Ditches, Drainage systems, Taxes, Obstruction to flow, Repairing, Administration, Management, Operation and maintenance, Maintenance.

Plaintiffs were owners of land drained by one of eleven branches of a judicial ditch system. The drain became obstructed by soil and vegetation. Plaintiffs sought to have the ditch cleaned by defendant drainage district under a statute obligating drainage districts to clean and repair their facilities on petition when the cost of such maintenance is less than 30 per cent of the cost of construction. Defendant contended that such maintenance was required only to benefit the entire system, not when a small part of the system needed repair. The Supreme Court of Minnesota held for plaintiffs. If defendant lacked sufficient funds to maintain the drain, plaintiffs were entitled to have the cost of cleaning and repairs assessed against all property within the district in the same proportion as costs of the original construction. The county board was obligated to keep in repair and unobstructed the entire judicial ditch system of the county. (Dye-Florida)
W71-00147

POOVEY V CITY OF HICKORY (CITY'S LIABILITY FOR WATER POLLUTION RESULTING FROM SEWAGE DISPOSAL).
210 NC 630, 188 SE 78-81 (1936).

Descriptors: *North Carolina, *Water pollution, *Compensation, *Sewage disposal, Remedies, Streams, Sewage, Adjudication procedure, Legal aspects, Local governments, Cities, Judicial decisions, Riparian rights, Waste disposal, Eminent domain, Condemnation, Municipal wastes, Water pollution control, Water quality, Water quality control, Treatment facilities.

Plaintiff landowner brought an action for nuisance and to recover damages from defendant city as a result of defendant's practice of dumping raw sewage into a creek which ran through plaintiff's property. Plaintiff contended that defendant's sewage disposal plant was wholly inadequate for the city's expanded population and asked for an injunction restraining defendant from operating the inadequate plant after a reasonable time. Plaintiff further sought damages for temporary injury to her property as well as for permanent injury, claiming a taking of her property under defendant's eminent domain powers. Defendant contended that the complaint was improper and moved to strike all references to defendant's increased population and financial ability as irrelevant and prejudicial. Reversing an order granting defendant's motion, the court held that, since defendant admitted the truthfulness of the allegations, it could not be said as a matter of law that the truth was irrelevant or prejudicial to defendant's case. The court also noted that it was entirely proper for plaintiff to seek to abate a nuisance in the same action in which damages were sought. (Liptak-Florida)
W71-00162

SINK V CITY OF LEXINGTON (LIABILITY FOR DAMAGE CAUSED BY BACKWATER FROM MUNICIPAL DAM).
214 NC 548, 200 SE 4-5 (1938).

Descriptors: *North Carolina, *Dams, *Backwater, *Flood damage, Natural flow doctrine, Riparian land, Riparian rights, Riparian waters, Water rights, Public rights, Remedies, Adjudication procedure, Judicial decisions, Legas aspects, Local governments, Watercourses (Legal), Ditches, Drainage effects, Drainage water, Surface drainage, Municipal water, Public utilities, Reasonable use, Cultivated lands, Beneficial use.

Plaintiff farmer brought action against defendant city and city utility commission for damages to his land resulting from the construction of a dam as part of the municipal water system. The backwater of the dammed creek reached to within 600 feet of plaintiff's farm which was located above the reservoir. Plaintiff contended that prior to the dam construction, a creek had provided drainage for his property, allowing him to use the land for cultivation and pasture, but that since the dam construc-

tion the land could not drain, was usually standing in water and was therefore unfit for cultivation. Defendant denied liability. Revising a judgment of nonsuit, the court held that plaintiff's evidence was sufficient to have the case submitted to the jury. The court noted that a riparian owner has a right to have the streamflow maintained as its natural flow and to use the water for domestic, manufacturing and other purposes subject only to the equal rights of beneficial use of other riparian owners. (Liptak-Florida)
W71-00206

SILAS MASON CO V TAX COMM'N OF WASHINGTON (STATE'S RIGHT TO TAX FEDERAL GOVERNMENT'S CONTRACTORS).
302 US 186, 58 Sup Ct 233-245 (1937).

Descriptors: *Washington, *Taxes, *Federal reclamation law, *Federal jurisdiction, Grand Coulee Dam, Columbia River, State jurisdiction, Legislation, Permits, Regulation, Judicial decisions, Governments, Federal government, State governments, Legal aspects, Contracts, Navigable rivers, Ownership of beds, Damsites, Dam construction, United States.
Identifiers: *Reclamation Act.

Plaintiff contractors brought suit to restrain the enforcement of the Occupation Tax Act of the State of Washington as applied to gross income they received for work performed in connection with the building of the Grand Coulee Dam on the Columbia River. The Washington supreme court upheld the tax and plaintiffs appealed. The United States Supreme Court stated that the questions presented were whether the tax imposed an unconstitutional burden on the federal government and whether the areas in which plaintiffs' work was performed were within the exclusive jurisdiction of the United States. The Supreme Court held that the tax did not impose an unconstitutional burden. The Court also held that the acquistion title to land for construction of the dam did not confer exclusive jurisdiction upon the United States unless the state had also transferred all residual jurisdiction to the United States. The state could retain jurisdiction over the areas owned by the United States for purposes not inconsistent with federal functions and could tax certain activities which Congress had permitted to remain subject to state licenses, permits and building and health regulations. (Hubener-Florida)
W71-00213

UNITED STATES V FLOWER (DISPUTE TO LAND CREATED BY AVULSION).

108 F2d 298-302 (8th Cir 1939).

Descriptors: *Iowa, *Nebraska, *Avulsion, *Accretion (Legal aspects), Bank erosion, Boundaries (Property), Boundary disputes, Rivers, Alluvium, Missouri River, Meanders, River beds, Ownership of beds, River flow, Riparian rights, Relative rights, Legal aspects, Judicial decisions, Federal government, Federal jurisdiction, Indian reservations, United States.

The United States brought suit on behalf of the Winnebago Indian Tribe to recover 4000 acreas of and which lay in the Missouri River bottom. Defendant contended that an avulsive action in the 1870's had caused the main channel of the river to shift towards Iowa, leaving land originally in Iowa on the Nebraska side of the river. Because of this avulsive change, defendant maintained that the and between the old and the new channels would remain part of Iowa. Plaintiff claimed title to the and as accretions to its holdings in Nebraska. The Court of Appeals, Eighth Circuit, affirmed the district court's holding that the western boundary of Iowa would remain in the middle of the channel of the Missouri River as of the time Iowa was admitted to the Union. Thus the land separated from Iowa by avulsion in the 1870's remained part of Iowa. The court held, however, that government was entitled to claim land forming the former channel bottom up to the middle of the former channel. (Hubener-Florida)
W71-00234

BD OF LEVEE COMM'RS FOR YAZOO-MISSISSIPPI DELTA V WITHERS (CONDEMNATION AND RIGHT TO CONSEQUENTIAL DAMAGES).
6 So 2d 115-117 (Miss 1942).

Descriptors: *Mississippi, *Levees, *Riparian land, *Condemnation, Condemnation value, Local governments, Dams, Embankments, Judicial decisions, Legal aspects, Relative rights, Flood control, River regulation, Compensation, Prescriptive rights, Land tenure, Riparian rights, Eminent domain, Discharge (Water), Seepage.

Plaintiff board sought to condemn a parcel of land owned by defendants which constituted part of a pond covering about 10 acres. Plaintiff had previously constructed a holding dam on its own property which caused the creation of the pond. The holding dam was to be abandoned and the pond water released. Defendants, who had enjoyed fishing and boating privileges in the pond, demanded consequential damages be awarded for loss of use of the pond. Defendants claimed that the pond had materially enhanced the value of their sites adjacent to the pond and that they were entitled to damages for the diminution in value of the sites. The court held that defendants, as riparian owners, had no right to demand permanent maintenance of the dam even though it had existed for 30 years. Consequential damages could only be awarded for the wrongful invasion of some right, and defendants had no rights to the pond or its water. (Hubener-Florida)
W71-00238

MACEDONIA BAPTIST CHURCH V CITY OF COLUMBIA (FLOODING FROM SURFACE DRAINAGE OF MUNICIPAL STREETS).
10 SE2d 350-359 (SC 1940).

Descriptors: *South Carolina, *Surface drainage, *Drainage systems, *Flood damage, Drainage, Ditches, Drainage effects, Drainage waters, Surface waters, Surface runoff, Damages, Floods, Judicial decisions, Legislation, Overland flow, Runoff, Cities, Local governments.

In an action for damages caused by surface waters which were drained from defendant municipality's streets and cast on plaintiff's land, plaintiff contended that the defendant was negligent per se in causing plaintiff's land to be flooded in that an adequate drainage system was not provided for such surface waters as required by statute. Defendant contended that any damage sustained by plaintiff resulted from causes over which defendant had no control and thus precluded defendant from liability. The court found that there was evidence to the effect that defendant had opened up ditches, cleaned sidewalks, widened roadbeds and performed other acts so as to cause the amount of water being drained to be substantially increased. The court thus held that such evidence was sufficient to establish that defendant had done such acts as to have required it to provide an adequate drainage system as called for by the statute, and upon its failure to so provide, defendant was negligent per se. The jury verdict for plaintiff was affirmed. (Snow-Florida)
W71-00239

KOONE V CAROLINA MOUNTAIN POWER CORP (NEGLIGENT OPENING OF FLOODGATES).
217 NC 286, 7 SE2d 565-566 (1940).

Descriptors: *North Carolina, *Dams, *Flood damage, *Impounded waters, Boundaries (Property), Judicial decisions, Land tenure, Legal aspects, Proprietary power, Relative rights, Riparian land, Riparian rights, Riparian waters, Rivers, Remedies, Damages, Dam failure, Floodgates, Overflow, Flooding, Floodwater, Excessive precipitation.
Identifiers: *Negligence.

Defendant power company constructed a dam across a stream, thus forming a lake behind the dam. Several days of rain caused the waters of the stream to become swollen and caused the level of the lake behind the dam to rise to the crest of the dam. Fearing that the dam might be swept away, defendant opened its floodgates, causing large amounts of water to flow into the already swollen stream. The stream then overflowed plaintiff's land resulting in extensive damages thereto. At trial a motion for nonsuit was granted to defendant. The Supreme Court of North Carolina reversed, holding that the evidence of the allegations of negligence in the complaint was sufficient to be submitted to the jury. (Clarke-Florida)
W71-00240

DAVENPORT V PITT COUNTY DRAINAGE DIST NO 2 (FLOODING FROM WRONGFUL CONSTRUCTION OF DRAINAGE SYSTEM).

220 NC 237, 17 SE2d 1-4 (1941).

Descriptors: *North Carolina, *Flood damage, *Overflow, *Drainage districts, Flooding, Flood water, Ponding, Drainage systems, Floods, Drainage, Ditches, Drainage effects, Drainage water, Judicial decisions, Conduits, Drainage, Engineering, Damages, Canal construction, Canals, Obstruction to flow, Legal aspects, Administrative agencies.

In an action for damage to crops resulting from overflow of a drainage ditch, plaintiff contended that defendant drainage district had negligently constructed a canal which resulted in plaintiff's lands being flooded and his crops destroyed. Plaintiff also contended that defendant had breached a contract wherein defendant had agreed to properly drain plaintiff's lands. Defendant contended that the negligence action was barred by a three year statute of limitation and that the contract was void. The court held that the flooding, though intermittent, was permanent so as to constitute a continuing trespass, and as such the cause of action accrued at the time of the initial flooding some seventeen years earlier so as not to be barred by the statute of limitations. The court further held that the contract was entered into only by the individual commissioners of the drainage district and was not the product of a formal corporate action as required by law. Consequently, the contract was invalid. Since plaintiff had no available remedy, the judgment for defendant was affirmed. (Snow-Florida)
W71-00241

HAMPTON V NORTH CAROLINA PULP CO (PRIVATE REMEDY FOR POLLUTION).
223 NC 535, 27 SE2d 538-547 (1943).

Descriptors: *North Carolina, *Water pollution, *Riparian rights, *Fisheries, Stream fisheries, Commercial fishing, Fish, Fishing, Migration, Judicial decisions, Legal aspects, Legislation, Water law, Impaired water quality, Pollutants, Reasonable use, Wastes, Water pollution effects, Chemical wastes, Industrial wastes, Relative rights, Remedies, Competing uses, Riparian waters, Streams.

Plaintiff fisheries operator brought action for damages and other relief from injuries resulting from the discharge of wastes from defendant's industrial plant downstream. Plaintiff alleged that pollution caused by defendant deterred fish from traveling upstream to plaintiff's fishery and interfered with plaintiff's livelihood. Defendant contended that any damage caused by his operation was purely public and created no cause of action in a riparian owner. The trial court dismissed the complaint, citing a case in which a fisheries owner

had been denied relief from damage caused by erection of a mill dam. The Supreme Court of North Carolina reversed, distinguishing the latter case on the grounds that operation of the mill dam was lawful, and riparian owners may not complain of private damages caused by reasonable exercise of a lawful right. In the instant case, however, pollution of the stream was in violation of state law. The court held that owners of fisheries upstream may maintain actions for wrongful interference with the migratory passage of fish whereby their fisheries are injured. It was irrelevant to the question of the peculiar nature of injury that damage was to a class of individuals. (Dye-Florida)
W71-00243

NANTAHALA POWER AND LIGHT CO V MOSS (CONDEMNATION OF RIGHT TO DIVERT RIVER FLOW).
220 NC 200, 17 SE2d 10-20 (1941).

Descriptors: *North Carolina, *Dams, *Condemnation value, *Compensation, Condemnation, Engineering structures, Rivers, River flow, Damsites, Riparian rights, Alteration of flow, Diversion, Riparian land, Riparian waters, Diversion structures, Streamflow, Diversion dams, Diversion losses, Water loss, Value, Judicial decisions.

Plaintiff power company brought a condemnation proceeding to acquire the right to divert the waters of a river which was adjacent to the lands of defendant riparian owners. Plaintiff, having constructed a dam for power purposes upstream from defendants' lands, contended that the value to be given for the property taken was to be determined on the basis of its value in the hands of defendants. Defendants contended that the value was to be determined on the basis of the enhanced value and advantages accruing to the one condemning the property and that inasmuch as the right to divert the water from the lands was indispensable to the plaintiff, such could be considered by the jury in evaluating the property. The court held that just compensation in condemnation proceedings merely required that the owner of the property taken should be paid for that taken from him and that the value of the property to the condemner for his particular use was not to be considered. (Snow-Florida)
W71-00244

DOMAN V BALTIMORE AND O RR (OVERFLOW FROM OBSTRUCTION BY BRIDGE CONSTRUCTION).
22 SE2d 703-706 (W Va 1942).

Descriptors: *West Virginia, *Obstruction to flow, *Bridges, *Alteration of flow, Railroads, Engineering structures, Rivers, Barriers, River flow, Damages, Flow, Erosion, Flood damages, Flooding, Overflow, Judicial decisions, Floods, Beds, River beds, Legal aspects.

In an action for damages, plaintiff contended that defendant railroad company, by laying the foundation of a bridge in a river bed, obstructed and altered the flow of the river in times of flood so as to cause the river to overflow and wash away plaintiff's lands abutting the river. Defendant contended that the construction of the bridge did not affect the ordinary level of the floodwaters which invaded plaintiff's land so as to be a contributing cause to plaintiff's damages. The court held that the evidence was not sufficient to establish that the bridge materially obstructed the river's flow or that it caused or contributed to the flooding and resultant damage of plaintiff's land. The jury's verdict for defendant was affirmed. (Snow-Florida)
W71-00256

KANE V CITY OF NAUGATUCK (DAMAGES FROM FLOW OF SURFACE WATER).
120 Conn 548, 183 A 227-229 (1935).

Descriptors: *Connecticut, *Surface drainage, *Drainage water, *Roads, Drainage, Surface runoff, Runoff, Floods, Overland flow, Soil erosion, Judicial decisions, Damages, Highways, Flow, Natural flow, Legal aspects, Cities.

In an action for damages, plaintiff contended that defendant municipality had laid out and graded a highway which accumulated and discharged surface drainage water upon her premises, thus causing her property to be washed away. The court found from the evidence that the grading of the street did not throw any water upon plaintiff's property that would not have been discharged upon it by the natural surface flow. The court held that since defendant had done no act which contributed to plaintiff's damages, it could not be held responsible for such damages. (Snow-Florida)
W71-00266

ROGERS V BROWN (LICENSING OF CLAM CULTIVATION OPERATIONS).
190 A 632-634 (Me 1937).

Descriptors: *Maine, *Clams, *Commercial shellfish, *Permits, Aquatic animals, Judicial decisions, Legislation, Riparian land, Littoral, Shores, Riparian rights, Ownership of beds, Relative rights, Regulation, Shellfish, Coasts, Oceans, Administrative decisions, Administration.

In an action for mandamus, plaintiff sought to force municipal officers to grant him a license to plant and cultivate clams on the foreshores adjacent to the municipality. Plaintiff, a littoral property owner adjacent to such shores, contended that the legislative act authorizing municipal officers to exercise control over the planting and cultivating of clams directed such officials as a matter of course to grant a license to littoral proprietors. Defendant municipal officials contended that their power to grant licenses was discretionary and thus not subject to mandamus. The court held that the granting of licenses to plant and cultivate clams was a discretionary power and thus was not subject to the extraordinary writ of mandamus. (Snow-Florida)
W71-00278

EISENSTEIN V MAYOR, COUNSELOR AND ALDERMEN (CITY'S DRAINAGE SYSTEM MUST BE ADEQUATE TO ACCOMMODATE USUAL RAINFALL).
9 A2d 224-227 (Md 1939).

Descriptors: *Maryland, *Drainage systems, *Surface water, *Rainfall-runoff relationships, Precipitation excess, Rainfall intensity, Cities, Drainage, Floodwater, Diversion, Rain water, Sewers, Sewage disposal, Overflow, Basins, Floods, Flow augmentation, Judicial decisions, Legal aspects, Local governments, Cloudbursts, Relative rights, Repulsion (Legal aspects), Surface runoff.

Plaintiff's land was flooded and thereby damaged, allegedly as a result of a drainage system constructed and maintained by defendant city. Plaintiff sought to have defendant enjoined from maintaining the system in a manner that was inadequate to prevent his property from being flooded during heavy rains. Plaintiff did not allege negligence in the construction or maintenance of said system. The court ruled that defendant was not obligated to do more than take care of the usual and ordinary flow of water occasioned by rainfall or otherwise, and that infrequent and extraordinary occurrences which could not be foreseen and provided against created no obligation for defendant. Surface water is a common enemy and every proprietor must fight for himself so long as such water takes its natural course. Defendant could improve and repair streets without being liable for consequential damage caused by surface water to adjacent property. The trial court's judgment for defendant was affirmed. (Price-Florida)
W71-00279

STATE V RUVIDO (DEFINITION OF TERRITORIAL WATERS IN CRIMINAL PROSECUTION FOR VIOLATION OF TERRITORIAL LIMITS).
15 A2d 293-297 (Me 1940).

Descriptors: *Maine, *Boundary disputes, *Tidal waters, *State jurisdiction, Adjudication procedure, International law, Judicial decisions, Jurisdiction, Legal aspects, Legislation, Public rights, State governments, Water law, Water rights, Atlantic Ocean, Bays, Oceans, Coasts, Law of the sea, Shores, Islands, Continental margin, Commercial fishing, Seashores.
Identifiers: *Territorial waters.

Defendant commerical fisherman was convicted for a violation of a Maine statute prohibiting commercial fishing by non-residents in Maine's territorial waters between April 1st and November 1st. On appeal, defendant contended that he was fishing outside the state's territorial waters and that the statute was void for vagueness since it did not define territorial waters, nor did any other state statute. Affirming the conviction, the court adopted as a definition of territorial waters all waters within a marine league (three miles) from the coast, including bays not exceeding two marine leagues at their mouth. After extensive review of the geographical facts of the case, the court held that defendant was fishing within Maine's territorial limits. As to defendant's contention of vagueness, the court noted that the legislature could not exceed the territorial limits generally recognized by law, and held that the state's jurisdiction over territorial waters does not cease simply because the legislature has not defined them. (Liptak-Florida)

TOWARD AN EFFECTIVE AND CREDIBLE PROGRAM: WATER POLLUTION CONTROL,
Cornell Univ., Ithaca, N.Y. Water Resources and Marine Sciences Center.
Leonard B. Dworsky.
Transactions of the American Geophysical Union, Vol 51, No 8, August 1970, p 600-606. 16 ref.

Descriptors: *Planning, *Programs, *Federal government, *Water pollution, *Water quality, Navigable waters, Governments, Water pollution control, Water quality control, Water supply, Waste water treatment, Research and development, Sewage treatment, Technology, Management, Public health, Resource allocation, Priorities, Water policy.
Identifiers: *Public policy, *National water pollution control program, Policy, Technology assessment, Water quality management, Enforcement, Federal financial aid.

Marked changes are needed to produce an effective and credible national water pollution control program. Ten such changes are discussed: (1) federal jurisdiction over all navigable waters; (2) a national sewage and waste treatment policy; (3) a revision in the allocation of federal financial aid and the determination of project priorities; (4) regional water quality management programs as demonstration projects; (5) planning an effective national control program; (6) facilitating the use of advanced waste treatment technology; (7) improved enforcement of pollution control laws; (8) the consolidation of water supply and waste water service functions in local government; (9) research on better understanding the relationship between water pollution and public health; and (10) establishment of a program of technology assessment to assess consequences of man's actions. (Davis-Chicago)
W71-00311

SCANLON V IRON CITY SAND AND GRAVEL CO (LIABILITY FOR DREDGING OPERATIONS ABOVE THE LOW WATER MARK).

345 Pa 535, 29 A2d 82-84 (1942).

Descriptors: *Pennsylvania, *Dredging, *Boundary disputes, *Low water mark, Dams, Damages, Excavation, Rivers, Navigable rivers, Boundaries (Property), River beds, Banks, Riparian land, Islands, Judicial decisions, Water levels, Legal aspects, Water level fluctuations, Land tenure.

In an action to recover damages, plaintiff contended that defendant dredging company damaged its island property by removing sand and gravel above the ordinary low water line of the navigable river surrounding the island. Defendant contended that the ordinary low water line was no longer the boundary for measuring plaintiff's property. Instead, it was argued, the plaintiff owned only to a new mark, higher than the low water line, created by the raising of the level of the river by the construction of a dam by the federal government. Consequently, plaintiff did not own any land below the new mark and could not be harmed by defendant's operations. The court held that the raised water level by the construction of the dam did create a new line for determining the boundary of plaintiff's property. Therefore, the dredging did not interfere with plaintiff's possession, and defendant was not liable. (Snow-Florida)
W71-00314

CITY OF NEW BRUNSWICK V BOROUGH OF MILLTOWN (MUNICIPAL DISPOSAL OF WASTES).
135 NJ Eq 310, 38 A2d 288-290 (1944).

Descriptors: *New Jersey, *Municipal wastes, Contracts, *Sewage disposal, Sewage, Path of pollutants, Wastes, Water pollution, Water pollution sources, Water pollution control, Domestic wastes, Pollutants, Sewage treatment, Waste disposal, Judicial decisions, Streams, Water supply, Relative rights, Cities, Local governments.

In an action to have a contract cancelled, plaintiff city of New Brunswick contended that it had exceeded its power in entering into the contract and that the contract was void as being against public policy since it imposed a perpetual obligation. Defendant contended that the contract, which provided that plaintiff would dispose of defendant's sewage providing that the defendant would not dispose of its sewage into a common creek which would lead to the pollution of plaintiff's water supply, was valid and that plaintiff could not be excused from its execution because it was more burdensome than contemplated. The court held that there was statutory authorization for plaintiff to have entered into the contract and that there was no prohibition of a contract of perpetual duration. The contract was therefore valid and enforceable. (Snow-Florida)
W71-00328

LOVEJOY V TOWN OF DARIEN (DESTRUCTION OF COASTAL OYSTER BEDS BY MUNICIPAL CONSTRUCTION OF SEWAGE PIPELINES).
131 Conn 533, 41 A2d 98-101 (1945).

Descriptors: *Connecticut, *Oysters, *Commercial shellfish, *Ownership of beds, Permits, Aquatic animals, Aquatic life, Shellfish, Beds, Beds under water, Judicial decisions, Navigable waters, Navigation, Oceans, Relative rights, Damages, Coasts, Sewage disposal, Pipelines, Pipes, Cities, Jurisdiction.

In an action for damages, the owner of a state franchise for the cultivation of oysters in coastal waters contended that defendant municipality had destroyed the usefulness of his oyster bed by the construction of a sewage pipeline into the coastal area where the bed was located. Defendant municipality contended that it was not liable under a theory that the general public is the absolute owner of land under navigable waters and that therefore a sovereign is not liable for any damage to an individual that results from its acts. The court held that a sovereign has paramount rights over navigable waters in dealing with rights of navigation, but that when navigational rights are not involved or are not interferred with, then any property taken for a public use must be justly compensated for. Thus defendant was liable for damages done to the oyster bed since the construction of the sewage pipeline was not related to defendant's rights of control over navigation. (Snow-Florida)
W71-00351

KANARKOWSKI V BOROUGH OF NORTH BRADDOCK (DUTY OF CITY TO PROPERLY DRAIN STREETS).
157 Pa Super 325, 43 A2d 381-383 (1945).

Descriptors: *Pennsylvania, *Ice, *Highway icing, *Cities, Surface waters, Damages, Judicial decisions, Streams, Drainage, Drainage water, Runoff, Standing waters, Surface drainage, Ponding, Surface runoff.

In an action for damages for personal injury, plaintiff contended that defendant municipality was negligent in allowing a creek to overflow from a clogged spillway onto a street which upon becoming icy caused plaintiff to fall. The court held that the municipality was under a duty to provide for proper drainage of water from its public streets and upon its failure to do so, as a proximate cause of plaintiff's injuries, was liable for negligence. Jury verdict for the plaintiff was affirmed. (Snow-Florida)
W71-00399

STRAUCH V CITY OF SCRANTON (DUTY OF MUNICIPALITIES TO PROVIDE DRAINAGE FOR SURFACE WATERS).
353 Pa 10, 44 A2d 258-261 (1945).

Descriptors: *Pennsylvania, *Highway icing, *Drainage, *Surface waters, Ice, Judicial decisions, Drainage water, Runoff, Standing waters, Surface drainage, Freezing, Highways, Governments, Local governments, Damages, Legal aspects, Surface runoff, Cities.

In an action to recover for injuries sustained from a fall on ice in a municipal roadway, plaintiff contended that defendant municipality had a duty to provide a drainage system adequate to prevent the forming of ice in the roadway from the accumulation of surface water naturally flowing upon such roadway. Defendant contended that its duty to keep its streets in a reasonably safe condition did not extend to the providing of drainage for the natural flow of surface water. The court held that there was a duty to provide a drainage system only in the exceptional case, whereas in the ordinary case the providing of a drainage system rested in the discretion of the municipality. The court held that the flow and discharge of surface water in this case was not of sufficient quantity and volume to place it within the exceptional case. The court ruled that defendant, being under no duty to provide a drainage system, was not liable for the injuries resulting from plaintiff's fall on the ice. (Snow-Florida)

HARRISON V GRANDISON CO (STATE OWNERSHIP OF BEDS UNDER NAVIGABLE WATERS).
51 F Supp 768-775 (ED La 1943).

Descriptors: *Louisiana, *Ownership of beds, *Navigable waters, *Boundary disputes, Land tenure, Land, Real property, Oil, Oil industry, Drilling, Oil fields, Oil wells, Drill holes, Exploration, Bayous, Beds, Geds under water, Boundaries (Property), Islands, Judicial decisions, Legal aspects.
Identifiers: *Servitude.

Plaintiff landowner brought suit to have defendant company's mineral servitude over his land declared extinguished by non-use. Plaintiff's grantor had reserved such interest and had later transferred the rights to defendant. A Louisiana statute required exercise of such rights within ten years or else they would be forfeited. Defendant had sunk two wells, one within the ten year period and the other on the day the period ended. The wells were sunk in different areas of plaintiff's land and plaintiff argued that certain bayous which traversed his property were navigable, thus giving the state ownership of the beds and separating his land into several parcels. If this were true, then only the area contiguous to the first well would remain subject to the servitude and the allegedly separate area surrounding the second well would be free from defendant's interest. The United States District Court, Eastern District of Louisiana, found that the bayous were not navigable, that plaintiff's land was all one tract and that defendant's entry onto one part of the land was sufficient to preserve the servitude over the entire area owned by plaintiff. (Barker-Florida)

TOWN OF DICKSON V STEPHENS (SPECIAL DAMAGE REQUIRED TO RECOVER FOR POLLUTION DAMAGE FROM MUNICIPALITY).

96 SW2d 201-212 (Tenn Ct App 1935).

Descriptors: *Septic tanks, *Tennessee, *Water pollution, *Sewage disposal, Municipal wastes, Judicial decisions, Legal aspects, Environmental sanitation, Construction, Waste treatment, Damages, Rivers, Cities, Local government, Adjudication procedure.

Plaintiff was the owner of a tract of farming and pasture land which had a river flowing through it. Plaintiff brought an action against defendant municipality for damages which resulted from the alleged pollution of the river by the drainage of sewage from a disposal plant constructed by defendant. The Court of Appeals of Tennessee affirmed a trial court decision for plaintiff and held that there was evidence of a depreciation in the rental value of plaintiff's farm which constituted special damages to plaintiff's property not likewise suffered by the public at large; therefore, the plaintiff did not lack standing as contended by the defendant. The court also held that evidence as to whether the condition of the stream at plaintiff's property was a nuisance at the time complained was for the jury to consider. Furthermore, the court held that evidence as to the character of the running stream above the landowner's premises and at the disposal plant was admissible in determining the condition of the stream at landowner's premises. KELLEY V CITY OF CAPE GIRARDEAU (CITY'S LIABILITY FOR SUCCESSIVE OCCURRENCES OF FLOOD DAMAGE CAUSED BY FAULTY STREET DRAINAGE).
89 SW2d 41-46 (Mo 1935).

Descriptors: *Missouri, *Drainage water, *Flood damage, *Adjudication procedure, Judicial decisions, Legal aspects, Water law, Compensation, Water injury, Damages, Remedies, Surface drainage, Roads, Drainage effects, Grading, Surface drainage, Rain water, Runoff, Cities, Local governments, Drains, Flooding, Storm drains.

Plaintiff landowner brought action against defendant city for damages resulting from flooding of plaintiff's property caused by the improper grading, curbing and guttering of defendant's streets. Plaintiff had already recovered damages in several previous actions for flooding on specific dates, but defendant failed to correct the improper drainage, and plaintiff sought to recover for damages occurring both prior to and after the previous actions. Defendant contended that plaintiff was barred from recovering for any damage which occurred prior to the previous actions, as those damages should have been sought in those actions. Reversing a judgment for plaintiff, the court held

that each occurrence of flood damage gave rise to a distinct right of action but that, in any one action, plaintiff should have sought all damages which had occurred up to that time. Therefore, in the present action, plaintiff was barred from recovering for those damages which had occurred prior to his last action against defendant, but could recover for any flood damage which had occurred since then. (Liptak-Florida)
W71-00426

MILLER LEVEE DIST NO 2 V WRIGHT (COMPENSATION FOR LAND DAMAGED VIA EMINENT DOMAIN TAKING).
111 SW2d 469-472 (Ark 1937).

Descriptors: *Arkansas, *Eminent domain, *Condemnation, *Compensation, Right-of-way, Drainage, Levees, Damages, Judicial decisions, Legal aspects, Drainage effects, Drainage water, Drainage districts, Condemnation value, Drainage practices, Drainage systems, Crop response, Property values.

Plaintiff landowner brought action to recover damages for injury to his property caused by a loop levee constructed by defendant. Plaintiff contended his recovery should include damages for all injury caused by reason of the levee. Defendant contended that plaintiff's rights of recovery and damages, if any, were limited to the actual value of the land taken, damages for resulting inconvenience, and damages to the remainder of the property caused by obstruction to the natural drainage. The court ruled that defendant's contention was contrary to statutory law and the state constitution. Where there is any invasion of private property by lawful authority for a public use and the property is damaged thereby, there is a taking within the meaning of the law, and where the damage is such as to deprive the owner of the beneficial use of his property, he may require that its value be paid him. The trial court's judgment for plaintiff was affirmed. (Price-Florida)
W71-00432

PETERSON V CITY OF ST JOSEPH (TITLE TO ACCRETION TO ISLAND).
156 SW2d 691-695 (Mo 1941).

Descriptors: *Accretion (Legal aspects), *Riparian land, *Islands, *Missouri, Missouri River, Navigable rivers, Riparian rights, Interstate rivers, Banks, Boundaries (Property), River beds, Land tenure, Real property, Local governments, Cities, Judicial decisions, Legal aspects, Riparian waters, Land forming, Erosion.

Plaintiff landowner brought action against defendant city to determine title to land formed by accretion in the Missouri River. Plaintiff contended that the land was formed by accretion to an island in the river and that he acquired title to the land under a patent from the county. Defendant contended that the land was formed by accretion to the shore and, as a riparian owner of the shore, the city was entitled to the land. Affirming a judgment for plaintiff, the court held that land which first forms in the river and later attaches to the land does not vest title in the riparian owner unless he also owns the river bed. Since the land first formed by accretion to the island, title was properly in the owner of the island. (Liptak-Florida)
W71-00439

HALE V KANSAS CITY, MO (CITY'S LIABILITY FOR FLOOD DAMAGE CAUSED BY FAILURE TO OPEN FLOODGATE DURING RAINSTORM).
187 SW2d 31-41 (Mo Ct App 1945).

Descriptors: *Missouri, *Flood damage, *Storm drains, *Flood gates, Subsidence, Settlement (Structural), Runoff, Rain water, Water injury, Remedies, Judicial decisions, Legal aspects, Adjudication procedure, Sewers, Surface water, Local governments, Citites, Drains, Backwater, Pumping plants, Flood control, Cloudbursts, Compensation, Drainage systems.

Plaintiff paper bag company brought action against defendant city for flood damage to plaintiff's building caused by defendant's failure to open the sewer system's main floodgate during a heavy rainstorm. Plaintiff contended that no flooding would have occurred if defendant had opened the main storm drain and operated its drainage pumps. Defendant argued that submission of plaintiff's contention to the jury was improper since the purpose of the floodgate was not to facilitate the sewage system's flow, but to prevent water from the river from backing up into the sewer system during high water. Affirming a judgment for plaintiff, the court held that, regardless of the primary purpose of the floodgate, the jury properly heard and decided the question of whether defendant's failure to open the gate during the rainstorm was the proximate cause of the damage to plaintiff's building. BENEFICIAL USE OF WATERSHEDS (IMPROVEMENT OF WATERSHED MANAGEMENT; NECESSITY FOR NEW WATER-ALLOCATION POLICY TO ACCOUNT FOR THE INCREASE IN RECREATIONAL USE).

American Water Works Association Journal, p 455-457 (1970).

Descriptors: *Watershed management, *Watershed Protect. and Flood Prev. Act, *Water allocation policy, *Water sports, Erosion control, Flood control, Surface runoff, Water management (Applied), Water supply, Watersheds (Basins), Small watersheds, Multiple-purpose projects, Pre-impoundment, Water shortage, Water utilization, Recreation, Water conservation, Water pollution control, Irrigation programs, Municipal water, Sedimentation.

Two papers discuss the increased awareness of the importance of proper protection and management of watersheds. The first paper points out the rapid increase in recreational use of water supplies and the need to consider such use--in addition to the traditional uses for public supply, navigation, irrigation, and power generation--when planning water priorities, pollution control, and cost allocation. The second paper discusses the problem of small watersheds and the results of the Federal Watershed Protection and Flood Prevention Program which assists local communities in providing for flood prevention as well as the development of municipal, industrial, agricultural, and recreational water resources. (Liptak-Florida)
W71-00487

INDIANAPOLIS WATER CO V LUX (NECESSITY FOR CONDEMNATION OF PROPERTY FOR RESERVOIR).
64 NE2d 790-794 (Ind 1946).

Descriptors: *Indiana, *Condemnation, *Reservoirs, *Compensation, Eminent domain, Remedies, Damages, Dams, Backwater, Flooding, Flood damage, Water injury, Judicial decisions, Legal aspects, Adjudication procedure, Administrative decisions, Water supply, Water works, Public utilities, Real property.

Plaintiff water company brought action against defendant property owners to condemn their land for the construction of a dam and a reservoir. Plaintiff contended that some portions of defendants' land would be permanently flooded, some would be flooded at times of high water, and the remainder of the property was necessary for a border around the reservoir. Defendants argued that the land was not necessary for the proposed project. Reversing a judgment for defendants, the court noted that the question of necessity is usually left to the discretion of the condemning agency, but in a case where the contention is that there is no need at all, the courts will review such agency's decision. The court held that, although it usually does not weight the evidence, defendants had no evidence to dispute plaintiff's contentions or to justify the lower court's opinion. (Liptak-Florida)

NORTHERN STATES POWER CO V FEDERAL POWER COMM'N (REGULATORY POWER OF THE FEDERAL POWER COMMISSION).
118 F2d 141-144 (7th Cir 1941).

Descriptors: *Wisconsin, *Administrative agencies, *Public utilities, *Navigable waters, Judicial decisions, Legal aspects, Legislation, Federal government, Costs, Powerplants, Regulation, Permits, Hydroelectric power, Hydroelectric plants, Hydroelectric project licensing, Supervisory control (Power).
Identifiers: *Federal Water Power Act.

Petitioner utility company instituted proceedings to set aside a portion of an order by the Federal Power Commission directing petitioner to charge off certain items from its books in accord with the Commission's accounting requirements. Petitioner had applied with the Commission to have its utility project licensed in accord with the Federal Water Power Act. The court stated that the Act contemplates construction and operation of water power projects on navigable waters and government lands. Under certain circumstances, the government may take over projects, in which case the licensee receives reimbursement for its net investment. The Commission had ordered petitioner to charge certain items off because they did not represent a part of its net investment. Petitioner did not argue that these items were in its net investment, but questioned the right of the Commission to require it to strike these items from its account. There is no express authority in the Act empowering the Commission to require uniform accounting. The court found that the Commission's orders were a reasonable exercise of its power pursuant to the Act. These orders were not binding upon state utility agencies and did not constitute an unreasonable invasion in the field of management. (Duss-Florida)
W71-00489

HARPER V LEARNED (BOUNDARY DISPUTE OVER BATTURE LAND).

199 La 398, 6 So 2d 326-333 (1942).

Descriptors: *Louisiana, *Boundary disputes, *Accretion (Legal aspects), *Mississippi River, Boundaries (Property), Navigable rivers, Ownership of beds, Islands, Riparian rights, Lumbering, Riparian land, Riparian waters, Legal aspects, Judicial decisions, Adjudication procedure, Relative rights.

Plaintiff riparian landowner brought action against defendant riparian landowner to determine the mutual boundary between their respective batture lands and for damages for wrongful removal of timber. Plaintiff and defendant's predecessor in interest had agreed orally 40 years previously upon a visible boundary between their respective properties; defendant purchased his land in reliance upon that boundary. The court held that plaintiff was estopped from maintaining that the boundary previously agreed upon was not the proper boundary as between himself and defendant. The court stated that the batture lands were granted to the riparian owner by law, observing that parol evidence was admissible to prove a visible bounda-

ry recognized by the parties. Plaintiff's suit was dismissed by the court. (Hart-Florida)
W71-00490

LOSSING V SHULL (ONE WHO ACQUIRES TITLE TO MAIN LAND BY ADVERSE POSSESSION ACQUIRES TITLE TO ACCRETED LAND).
173 SW2d 1-8 (Mo 1943).

Descriptors: *Missouri, *Accretion (Legal aspects), *Prescriptive rights, *Patents, Judicial decisions, Legal aspects, Rivers, Mississippi River, Boundaries (Property), Bank erosion, Water rights, Riparian rights, Riparian land, Banks, Remedies, Riparian waters, Prior appropriation.
Identifiers: *Adverse possession.

An 1860 patent granted a portion of the west high bank of the Mississippi River to plaintiff's predecessors in title. The patent failed to expressly name the state and county wherein the land was located. Five acres of land were added to this grant through accretion. In 1932, defendant's predecessor in title docked his houseboat on the accreted tract, assumed possession, and subsequently, conveyed the accreted land to defendant. Plaintiff brought an action to quiet title and an action in ejectment for the accreted land. Defendant contended that plaintiff, having failed to establish title by deed in any land at the river's edge because of the defective patent, could not maintain an ejectment action for accreted land. Defendant further contended that, if plaintiff acquired the granted land by adverse possession, title was not acquired so that accretion would attach to such lands. The Supreme Court of Missouri, in affirming a judgment for plaintiff, held that the defective patent was sufficient to pass title. Furthermore, accretion becomes a part of the land to which it is built, and follows whatever title covers the main land, whether it be title by deed or by adverse possession. (Powell-Florida)
W71-00491

GERLACH LIVESTOCK CO V THE UNITED STATES (RIPARIAN RIGHTS ARE PROPERTY RIGHTS NOT TO BE TAKEN WITHOUT JUST COMPENSATION).

102 Ct Cl 392-399 (1944).

Descriptors: *California, *Condemnation, *Riparian rights, *Compensation, Diversion losses, Eminent domain, Irrigation, Navigable waters, Navigation, Relative rights, Public rights, Federal government, Flood control, Legislation, Land reclamation, Dams, Riparian land, Riparian waters, Judicial decisions, Legal aspects, Alteration of flow, Diversion dams.

Plaintiff landowner sought to recover the value of his water rights allegedly lost by the construction of a dam by defendant United States. Plaintiff contended defendant's action was a taking of private property as contemplated by the fifth amendment. Defendant contended that plaintiff's petition failed to allege a taking of its property or property rights within the meaning of said amendment, and that any damage was indriect, consequential, and not within the jurisdiction of the court. The court ruled that a landowner's rights in a navigable stream are subject to the paramount right of the government to take whatever steps it deems necessary in the improvement of navigation, but the government has no such right in the water of a stream for irrigation purposes. Plaintiffis riparian rights in the stream, if any, were property rights, of which he could not be deprived without being paid just compensation. Defendant's demurrer was overruled. (Price-Florida)
W71-00492

PITT RIVER POWER CO V UNITED STATES (RIGHT TO COMPENSATION FOR CONDEMNATION ACCRUES ONLY AFTER ACTUAL LOSS OCCURS).
98 Ct Cl 253-256 (1942).

Descriptors: *California, *Flood damage, *Riparian rights, *Land reclamation, Judicial decisions, Legal aspects, Flood protection, Flooding, Flood control, Eminent domain, Condemnation, Federal government, Dams, Legislation, Canals, Reservoirs, Adjudication procedure, Compensation, Water injury.

Plaintiff landowner sought damages under a condemnation theory for flooded lands, for lands that would not be flooded but would be damaged due to flooding, and for the loss of riparian rights that he contended would result from defendant United States' construction of dams and reservoirs near his property. Defendant contended that plaintiff had failed to state a cause of action as the dams were not completed, no flooding had taken place, and plaintiff had not sustained any loss. The court, held that no cause of action had been stated since no loss had come to plaintiff and no loss might ever come as the project might never be completed. The granting of defendant's demurrer was sustained. (Price-Florida)
W71-00493

THE OYSTER CASES (DAMAGE TO OYSTER BEDS CAUSED BY DREDGING OPERATIONS).
94 Ct Cl 397-441 (1941).

Descriptors: *United States, *Oysters, *Dredging, *Damages, Federal jurisdiction, Channel improvement, Bottom sediments, Ownership of bed, Legislation, Beds, Silting, Channels, Harbors, Coastal engineering, Legal aspects, Navigation, Compensation, Adjudication procedure, Leases, Commercial shellfish, Federal government.

Plaintiffs claimed that their oyster beds had been damaged by dredging operations of the United States. A suction dredge used to improve the New Haven harbor channel threw up large quantities of mud and silt, covering the oyster beds and killing the oysters. Shovel-type dredges had previously been used with little damage to beds. The court found that the failure of the United States to give notice, until shortly before the operation began, that the suction dredge would be used constituted failure to use due care in the protection of plaintiffs' property. In all instances, the court found that the exact amount of damage was impossible to determine. Also, despite the short notice, the court held that plaintiffs could have mitigated damages to some extent by moving as many oysters as possible out of the affected area beforehand. In each instance, plaintiffs recovered the court's estimate of non-mitigable damages. (Caldwell-Florida)
W71-00494

KIRCH V UNITED STATES (CONDEMNATION OF RIPARIAN LAND BY FAILURE TO MAINTAIN LEVEE).
91 Ct Cl 196-203 (1940).

Descriptors: *Louisiana, *Compensation, *Levees, *Condemnation, Mississippi River, Flood protection, Eminent domain, Shore protection, Flooding, Flood damage, Soaking, Water injury, Federal government, United States, Federal project policy, Administrative agencies, Depreciation, Judicial decisions, Legal aspects, Erosion.

Plaintiff riparian landowner sought to recover damages under the fifth amendment of the Constitution from defendant United States for a taking of his property. Plaintiff's land extended to a levee on the Mississippi River. Because of continued erosion by the river, defendant erected a second levee further back from the river, leaving the original levee and plaintiff's land between the levees to be flooded and eroded. Plaintiff contended that this action constituted a taking under the fifth amendment. The court initially noted that erection of the set-back levee did not cause the river to flood plaintiff's land, and that flood control legislation did not assume responsibility for consequential damages. The court stated that defendant had no duty to erect and maintain levees to protect riparian owners, and hence was under no duty to respond in damages. Loss of market value was found by the court not to constitute a fifth amendment taking. The court concluded that there had been no taking within the fifth amendment, and dismissed plaintiff's petition. (Hart-Florida)
W71-00495

MATTHEWS V UNITED STATES (LIABILITY FOR CONSEQUENTIAL FLOODING CAUSED BY FLOOD CONTROL PROJECT).
87 Ct Cl 662-721 (1938).

Descriptors: *United States, *Flood control, *Condemnation, *Compensation, Easements, Flood damage, Legislation, Levees, Floodways, Damages, Land use, Legal aspects, Floods, Flood plains, River basins, Backwater, Surface drainage, Rivers, Flooding, Historic flood, Water levels, Overflow, Blowouts, Mississippi River.

Plaintiff sought compensation for an alleged taking of his land. He claimed that the construction of a flood control project along the Mississippi River would result in backwater being diverted onto his forestland whenever the river reached a certain level. While the evidence supported plaintiff's contention, it was also brought out that the property had always been subject to flooding when the river reached that level. The court held that to constitute a compensable taking, the overflow had to be the direct result of and wholly attributable to the government project, and constitute an actual and permanent invasion of the land. Because the alleged flooding was held to be merely a temporary condition, and because the project was not the sole cause of the flooding, any damage which the plaintiff had suffered was held to be merely consequential injury. Such injury was held non-compensable, and recovery was denied. (Caldwell-Florida)
W71-00496

MARRET V UNITED STATES (LIABILITY FOR DAMAGES CAUSED BY RAISING WATER LEVEL OF RIVER).
82 Ct Cl 1-14 (1935).

Descriptors: *Kentucky, *Dams, *Eminent domain, *Water levels, Ownership of beds, Navigable rivers, Navigation, Riparian land, Riparian rights, Riparian waters, Federal Power Act, High water mark, Low water mark, Condemnation, Damages, Water injury, Flooding, Flood damage, Buildings, Judicial decisions, Legal aspects, Water level fluctuation, United States.

Plaintiff landowner brought action against defendant United States for inverse condemnation. Plaintiff owned riparian land located on a river. He erected a resort hotel in the river bed, designing it so that periodic high water would flow through the lower floor. Defendant United States raised its dam level two feet, causing a permanent increase in the river level and flooding the lower part of the hotel. Consequently, the hotel structure began to settle and crack. Plaintiff contended that his property was taken without just compensation. The court noted the marked distinction between a taking and mere resulting damage, and held that defendant was not liable for plaintiff's damages. The court found that a riparian owner's title to the bed below high water mark was subservient to the paramount power of defendant to improve navigation. Concluding that plaintiff was merely damaged by rightful government action, the court dismissed plaintiff's petition. (Hart-Florida)
W71-00497

L J HOUZE CONVEX GLASS CO V UNITED STATES (WATER DAMAGE TO GAS WELL).
81 Ct Cl 661-670 (1935).

Descriptors: *New York, *Dams, *Navigable rivers, *Wells, Natural gas, Design flood, Ponding, Eminent domain, Condemnation, Condemnation value, Navigation, Flooding, Inflow, Soaking, Submergence, Wetting, Flood damage, Judicial decisions, Legal aspects, Overflow, Dam design, United States.

Plaintiff glass company sued defendant United States for damages to plaintiff's gas well. Defendant raised the height of its dam, which made the earth around plaintiff's well wet and infirm. Two subsequent floods caused water to overflow into plaintiff's well, stopping gas production. Plaintiff contended that raising the dam height caused the well to overflow; defendant claimed the subsequent floods were the direct cause of plaintiff's injury. The court noted that defendant had the power to construct a dam in aid of navigation, and that defendant could be liable for property taken as a direct result. However, the court found that defendant was not liable for consequences not directly attributable to the dam, and since the floods caused plaintiff's injury, the court dismissed plaintiff's petition. (Hart-Florida)
W71-00498

JOHNSON V UNITED STATES (FLOODING CAUSED BY INCREASING DAM HEIGHT).
80 Ct Cl 367-375 (1934).

Descriptors: *West Virginia, *Flooding, *Dams, *Compensation, Eminent domain, Condemnation value, Condemnation, Flood damage, Design flood, Damages, Judicial decisions, Legal aspects, Submergence, Ponding, Navigation, Dam design.

Plaintiff landowner sued defendant United States for damages for inverse condemnation of plaintiff's land by defendant. Defendant increased the height of its dam, which caused inundation of plaintiff's land, rendering plaintiff's route of ingress and egress impassable. The court held that defendant's actions constituted a taking for public use, and that plaintiff was entitled to just compensation therefor. (Hart-Florida)
W71-00499

PEOPLE EX REL NEW YORK CENT RR V STATE TAX COMM'N (NAVIGABILITY OF RIVER DETERMINES TAX ASSESSMENT).
268 App Div 805, 48 NYS2d 570-571 (1944).

Descriptors: *New York, *Navigable rivers, *Bridges, *Assessments, Taxes, Navigable waters, Rivers, Streams, Administrative agencies, State governments, Judicial decisions, Legal aspects, Administrative decisions, Railroads.

Plaintiff railroad company brought action to review a tax assessment of defendant Tax Commission. Defendant had assessed plaintiff's bridge as a special franchise. The navigability of the river at the bridge determined whether the bridge was a special franchise. The court noted that the legislature had twice declared the river a public highway for transportation of logs and other property, and found that the lower court had improperly tested navigability by whether the bridge interfered with use of the river as a public highway. Holding that the river was navigable and that the assessment was proper, the court reversed the lower court's decision for plaintiff. (Hart-Florida)
W71-00500

NIAGARA FALLS POWER CO V MALTBIE (CONTROL OF HYDROELECTRIC POWER RATES).
41 NYS2d 424-432 (1943).

Descriptors: *New York, *Navigable rivers, *Hydroelectric power, *Federal Power Act, Hydroelectric plants, Hydroelectric project licensing, Dams, Administrative agencies, Electric power rates, State governments, Water allocation (Policy), Administrative decisions, Judicial decisions, Legal aspects, Federal government.

Plaintiff hydroelectric company brought action against defendant public service commission to review a rate order promulgated by defendant. Plaintiff's dam was on the Niagara River. Requirements for additional war production caused the Federal Power Commission to allow plaintiff to divert more water, but the Commission required that an amount equal to the additional profits generated thereby at the present rate be placed in a reserve fund. However, defendant also reduced the rate which plaintiff could charge commensurately with the profit from the additional diversion. Hence, if plaintiff complied with the orders of both commissions, it would operate at a substantial loss. The court noted that since the river was navigable, Congress had power to regulate use of the water. Furthermore, the court found that the Commission had no authority under the Federal Power Act to fix rates, that authority being reserved to defendant. Therefore, the court held that defendant's rate was proper, and since no profit would be created at the lowered rate, no payments would accrue to the reserve fund. (Hart-Florida)
W71-00501

PEOPLE EX REL NEW YORK CENTRAL RR V STATE TAX COMM'N (NAVIGABILITY CRITERIA IN DETERMINING TAXABILITY OF BRIDGE).
258 App Div 356, 16 NYS2d 812-819 (1940).

Descriptors: *New York, *Taxes, *Navigable waters, *Bridges, Railroads, Ownership of beds, Rivers, Non-navigable waters, Riparian rights, Public rights, Easements, Legal aspects, Judicial decisions, Bays, Structures, Bridge design, Beds under water, Boats, Transportation, Legislation, Administrative agencies.

Plaintiff railroad sought to have a special franchise tax, which defendant State Tax Commission had levied on several of its bridges, annulled. The tax was applicable only to bridges crossing navigable waters for a distance of more than 250 feet. The railroad contended that although the total length of each bridge exceeded 250 feet, only that portion of the river beneath the bridges' high center span was in fact navigable, and that it was this shorter length which should be used in determining the applicability of the statute. The court rejected this contention, holding that the historic test for navigability was whether the waterbody could be used for waterborne commerce. If this test was met, the entire river was to be considered navigable, not just the portion actually used by the commercial transportation. The imposition of the franchise tax was upheld by the court, which held that the entire width of a navigable stream was to be considered in determining whether the 250 foot criteria was met. (Caldwell-Florida)
W71-00502

PEOPLE V REILLY (RIGHT TO REGULATE ACTIVITIES OVER OWNED BEDS).
14 NYS2d 589-595 (1939).

Descriptors: *New York, *Boating regulations, *State jurisdiction, *Coasts, Administrative agencies, Boats, Supervisory control (Power), Regulation, Legal aspects, Judicial decisions, Ownership of beds, Beaches, Navigable waters, Atlantic Ocean, Recreation, Navigation, Relative rights, Public rights, Condemnation, Beds under water, Local governments.

Defendant was accused of violating the city's regulations forbidding advertising or boating within 1000 feet of the Coney Island Beach. He challenged the city's jurisdiction over him on the grounds that the city's boundary ran only to the low water mark of the ocean. He contended that any regulation covering areas beyond the city boundary would therefore be invalid. However, the city had previously acquired through condemnation the ocean beds extending out 1000 feet into the Atlantic Ocean. The court held that in the absence of express statutory limitations, the boundaries of the city extended to the farthest point of the territory owned by it. As the defendant's actions took place in the ocean less than 1000 feet offshore, the city was held to have jurisdiction. The court found the regulations to be reasonable, and the defendant was found guilty of violating them. (Caldwell Florida)
W71-00503

WOOD V MAITLAND (DISPUTE OVER TITLE TO LAKESHORE AND MARSH).
169 Misc 484, 8 NYS2d 146-157 (1938).

Descriptors: *New York, *Boundaries (Property), *Lakes, *Boundary disputes, Water levels, Water level fluctuations, Shores, Legal aspects, Marshes, Land tenure, Relative rights, Judicial decisions, Navigable waters, Inland waterways, Outlets, Ponds, Lake Ontario, Low water mark, State governments.

Plaintiff sought to assert title to property along Lake Ontario down to the existing shoreline. Defendant state claimed that the original grant to plaintiff's predecessor in title, reflecting a boundary 'along the lake', fixed the boundary of the property at the shoreline as of the date of the grant. The water level having fallen since the grant, the state claimed ownership of the additional exposed land. The court rejected this claim, holding that the proper boundary was the variable low water mark of the lake and that plaintiff therefore owned the additional land. Plaintiff similarly asserted his claim to a pond and marsh on his property near Lake Ontario, defendant claiming that they were really part of the lake belonging to the state. The court found that as the pond level was higher than that of the lake, it was not and never had been part of the lake. The state could assert no title in it. (Caldwell Florida)
W71-00504

JOHN B KELLY, INC V LEHIGH NAV COAL CO (POLLUTION OF RIVER BY COAL MINING INDUSTRY).
151 F2d 743-749 (3d Cir 1945).

Descriptors: *Pennsylvania, *Water pollution, *Coal mine wastes, *River beds, Flooding, Coal mines, Water pollution sources, Water injury, Damages, Hydraulic mining, Pollutants, Water pollution effects, Federal jurisdiction, Judicial decisions, Legal aspects, Adjudication procedure, Industrial wastes.

Plaintiff riparian landowner sought damages and restraining injunction against defendant coal mining companies for discharge of mining wastes into river. Plaintiff contended that discharge of the wastes polluted the river, raised the river bed on plaintiff's land, interfered with plaintiff's business and constituted a continuing trespass on plaintiff's land. Defendants contended that plaintiff failed to allege damages in the jurisdictional amount and that plaintiff's damages were not special, but common with the public at large. The court found that liability of the companies was several rather than joint, but concluded that damages were merely collateral to the injunction sought, and therefore jurisdiction might properly be assumed over the issue of damages. Furthermore, the court found that plaintiff had sufficiently asserted special damages by alleging that the waste was settling upon his land and raising the water level over plaintiff's land. Plaintiff's complaint was held to state a cause of action. (Hart-Florida)
W71-00505

UNITED STATES V BELT (TITLE DISPUTE OVER RIPARIAN LAND).
142 F2d 761-67 (DC Cir 1944).

Descriptors: *District of Columbia, *Navigable rivers, *Riparian rights, *Boundary disputes, Navigation, Riparian land, Riparian waters, Highways, Federal government, Administrative agencies, United States, Reservation doctrine, J

dicial decisions, Legal aspects, Boundaries (Property), United States, Land tenure, Real property.
Identifiers: *Title disputes.

Plaintiff United States brought action to quiet title to riparian land claimed by defendant landowner. Defendant owned land lying between a road and a river; such land was conveyed to defendant's predecessor in interest by United States commissioners in consideration for other lands. Plaintiff contended that the commissioners had only conveyed a water privilege to defendant's predecessor. The court noted that riparian rights include access for navigation and the right to erect wharves, subject to sovereign regulation, and found that while riparian rights were qualified by the rights of the public, they could not be arbitrarily impaired. The previous conveyance by the commissioners to defendant's predecessors in title was held to be in fee simple, with full riparian rights adhering thereto, and the lower court's decision for defendant was affirmed. (Hart-Florida)

BANKLINE OIL CO V COMMISSIONER OF INTERNAL REVENUE (INCOME TO TENANT DERIVED FROM LEASE OF TIDELANDS FROM STATE IS TAXABLE).

0 F2d 899-906 (9th Cir 1937).

Descriptors: *California, *Legislation, *Taxes, Ownership of beds, Mineralogy, Permits, Rent, Mineral industry, Judicial decisions, Legal aspects, Public benefits, Public rights, Navigation, Relative rights, Leases, Administrative agencies, Administrative decisions.

In a petition for the review of decisins of the United States Board of Tax Appeals, petitioner sought exemption during the taxable year 1930 of all income derived from tidelands leased from the State of California for the purpose of producing oil and gas therefrom. The court stated that the State of California holds the tidelands within its boundaries in trust for the people so that they may enjoy the navigation of the waters, carry on commerce, and have the liberty of fishing therein free from interference of private parties. Petitioner's lease was granted pursuant to state statute, and the state supreme court had upheld such legislation against claims that it violated said trust. The income tax was not levied on the land so held in trust, nor the income of the state derived therefrom. The tenant obtaining such a lease for his own profit is subject to taxation, even if such liability reduces the amount received by the state as consideration for the lease. The Board's decision was affirmed as to petitioner's tax liability for income derived from the tidelands. (Price-Florida)
W71-00507

HEWITT V PERRY (ENJOINING OF INTERFERENCE WITH RECREATION EASEMENT).
4 NE2d 489-492 (Mass 1941).

Descriptors: *Massachusetts, *Bulkheads, *Easements, *Beaches, Beach erosion, Tidal effects, Shore protection, High water mark, Low water mark, Recreation, Swimming, Fishing, Boating, Retaining walls, Judicial decisions, Legal aspects, Relative rights, Remedies, Access routes.

Plaintiff easement holder sought to enjoin defendant riparian landowner from erecting a bulkhead which would interfere with plaintiff's easement. Plaintiff owned an easement appurtenant across defendant's beach for swimming, boating, fishing and recreation; plaintiff operated a boat rental business pursuant to the easement. Defendant had erected a bulkhead along the beach, and planned to extend it. Plaintiff asserted that the bulkhead interfered with his easement, and defendant counterclaimed that plaintiff's boat rental business surcharged the easement. The court noted that a beach is primarily the area between high and low water marks, but that in this instance the word had assumed a secondary meaning as land above the high water mark. The court held that defendant's ownership of the beach provided no right to interfere with plaintiff's easement, and ordered removal of the bulkhead. As to defendant's counterclaim, the court found that plaintiff's easement did not include operating a commercial boat-letting business, and enjoined plaintiff from its operation. (Hart-Florida)
W71-00508

STATE EX REL DUFFY V LAKEFRONT EAST FIFTY-FIFTH ST CORP (TITLE DISPUTE IN LITTORAL RELICTION).
137 Ohio St 8, 27 NE2d 485-487 (1940).

Descriptors: *Ohio, *Lake Erie, *Accretions (Legal aspects), *Boundary disputes, Boundaries (Property), Landfills, Land forming, Lakes, Lake beds, Bulkheads, State governments, Lake shores, Navigation, State jurisdiction, Reservation doctrine, Judicial decisions, Legal aspects, Littoral, Leases, Real property.
Identifiers: *Title disputes.

Plaintiff state brought action to evict defendant littoral leaseholder from a reliction on Lake Erie. The reliction was formed when the contiguous owners artificially filled their landfronts, forming a pocket in front of defendant's leasehold which facilitated natural accretion. Defendant contended ownership of the reliction by common law, while plaintiff asserted that since the reliction was formed artificially, defendant had no rights in it. The court first found that various statutes did not affect the common law, and stated that if the accretion was formed naturally, defendant had an estate therein. Artificial filling by contiguous littoral owners was found not to alter defendant's riparian rights. Finding that any artificial filling which may have occurred in the disputed reliction was trivial, the court held that the reliction was formed naturally, and that defendant held title thereto. (Hart-Florida)
W71-00509

IRIS V TOWN OF HINGHAM (DIVISION OF FLATS ADJACENT TO RIPARIAN LAND).

22 NE2d 13-17 (Mass 1939).

Descriptors: *Massachusetts, *Boundary disputes, *Accretions (Legal aspects), *Harbors, High water mark, Low water mark, Boundaries (Property), Riparian rights, Riparian land, Riparian waters, Navigable waters, Cities, Condemnation, Parks, Eminent domain, Ownership of beds, Remedies, Judicial decisions, Legal aspects.

Plaintiff riparian landowner brought action to recover damages for property taken by defendant city for a public park. Plaintiff asserted ownership of certain mud flats in a harbor. A colonial ordinance specified that an upland owner's title extended to the low water mark or 100 rods from the high water mark, whichever was the lesser. The court stated that an upland owner was entitled to an equitable portion of adjacent flats, considering in determining the portion of such ownership: (1) the width of upland; (2) the shape of shoreline; (3) the distance between high and low water marks; (4) the contours of the high water mark relative to the low water mark; (5) the length of high and low water marks; and (6) the total area of the flats. The general rule for determination of the division of flats was stated by the court as: (1) where the shoreline is relatively straight, the sidelines of the upland lots comprise the sidelines of the flats; (2) where the shoreline is concave, the sidelines of the flats are convergent; and (3) where the shoreline is convex, the sidelines are divergent. However the court held that when, as in the instant case, the characteristics of the site are unusual, the general rule is inapplicable, and equitable considerations will be used to determine the flat boundaries. (Hart-Florida)
W71-00510

CITY OF NEW YORK V THIRD AVE RY (LANDFILL AND BUILDINGS AS INCLUDED IN RIPARIAN RIGHT OF ACCESS).
294 NY 238, 62 NE2d 52-55 (1945).

Descriptors: *Riparian rights, *River beds, *New York, *Landfills, Usufructuary right, Docks, Railroads, Navigable rivers, Ownership of beds, Riparian land, Riparian waters, Legal aspects, Judicial decisions, Land tenure, Bulkhead line, Coastal structures, Access routes, Right-of-way, Public rights, Cities, Navigation, Transportation.

Plaintiff city brought an action against defendant railway company to recover possession of city property which defendant had filled in adjacent to its riparian land and to recover damages for the use of the land. Plaintiff contended that defendant's filling in of the river bottom and erection of several buildings thereon exceeded its riparian right to 'wharf out' as a means of access to deep water. Defendant argued that its buildings were related to the loading and unloading of freight and were therefore within the scope of its riparian right of access. Affirming a judgment for defendant, the court held that, although the wharfing right is subject to the superior right of the public, defendant's use of the property was reasonable as it was directly related to its freight operations, and there was no interference with any known or contemplated public use. (Liptak-Florida)
W71-00511

GOODWIN V TEXAS CO (LIABILITY FOR DAMAGES FOR SEEPAGE OF COLLECTED WATER AND OBSTRUCTION OF WATER-COURSE).
176 A 873-874 (Me 1935).

Descriptors: *Maine, *Watercourses (Legal), *Obstruction to flow, *Seepage, Diversion, Discharge (Water), Land tenure, Damages, Legal aspects, Judicial decisions, Easements, Flow, Channels, Banks, Beds, Streams, Flood damage, Overflow, Drainage, Relative rights, Dams, Landfills, Freshwater, Saline water, Maps.

Plaintiff landowners brought suit against defendant company for damages which resulted from the flooding of plaintiffs' lands. Defendant had made a landfill with dredgings, and sea water seeped through, overflowing plaintiffs' lands. Defendant had also obstructed a natural watercourse which drained plaintiffs' lands, resulting in more flooding. General verdicts were returned for plaintiffs and defendant appealed. The Supreme Judicial Court of Maine affirmed. Regarding the seepage of seawater from the fill, it is a settled rule that no one may artificially collect water on his land and discharge it unlawfully on his neighbor's property. As to the obstruction of the natural watercourse, it is settled that there is a public or natural easement in a watercourse belonging to all persons whose lands are benefited. It is unlawful to obstruct such watercourse or to divert it to the injury of other proprietors. Evidence supported a finding that defendant had obstructed a watercourse to plaintiffs' injury. (Duss-Florida)
W71-00512

STURTEVANT V FORD (UPSTREAM OWNER LIMITED TO REASONABLE USE OF WATER).
182 NE 560-567 (Mass 1932).

Descriptors: *Massachusetts, *Riparian rights, *Reasonable use, *Mill dams, Relative rights, Natural flow doctrine, Alteration of flow, Dams, Damsites, Obstruction to flow, Streams, Usufructuary right, Damages, Remedies, Flow rates, Fluctuation, Velocity, Water utilization, Water storage, Ponding, Water rights, Judicial decisions, Legal aspects.

In a suit for injunction and damages, plaintiff riparian landowner claimed that defendant upstream owner had unreasonably interfered with his riparian rights in a stream which flowed through both properties. Defendant had constructed and main-

tained small dams designed to produce power to operate mills on his property. However, no mill was erected at one of the dams and plaintiff argued that such storage of water for no reasonable purpose interfered with his riparian rights in that the flow of the stream was greatly diminished thereby. The Supreme Judicial Court of Massachusetts ruled that an upper riparian owner may make reasonable use of water and not be held liable for damages resulting from such reasonable use. The court affirmed the lower court's decision that the storage of water by defendant was unreasonable since no mill was operated thereby. The injunction granted below was upheld as to the one non-functioning dam but the assessment of damages was reversed for further consideration of the proper measurement of such damages. (Barker-Florida)
W71-00513

TICHENOR V HARBISON (DISCHARGE OF OIL WELL OVERFLOW INTO NATURAL WATERCOURSES).
166 NE 927 (Ind Ct App 1929).

Descriptors: *Indiana, *Damages, *Oil wells, *Oil wastes, Riparian rights, Relative rights, Remedies, Judicial decisions, Adjudication procedure, Legal aspects, Brine disposal, Wells, Water pollution sources, Water pollution effects, Groundwater, Wastes, Oily water, Oil, Oil industry, Industrial wastes, Brines, Riparian land, Natural streams, Land.

In an action by plaintiff landowners, seeking a restraining order and damages for the alleged wrongful discharge, into a natural watercourse, by overflows of mineral and salt waters from defendants' oil wells onto the lands of plaintiffs, defendants' demurrer was overruled. The cause was tried by a court without a jury and damages were awarded. Defendants' motion for a new trial was denied. The Appellate Court of Indiana affirmed on the authority of the case of Tichenor v Witherspoon, 87 Ind App 79, 158 NE 514. (Dye-Florida)
W71-00514

SMITH V BAY STATE DREDGING AND CONTRACTING CO (NEGLIGENT POLLUTION OF WATER BY DREDGING UNDER GARBAGE DISPOSAL WHARF).
172 NE 67-68 (Mass 1930).

Descriptors: *Massachusetts, *Docks, *Lobsters, *Water pollution, Watercourses (Legal), Developed waters, Sewage disposal, Garbage dumps, Dredging, Water rights, Judicial decisions, Legal aspects, Waste dumps, Waste disposal, Domestic wastes, Municipal wastes, Damages, Water pollution effects.

Plaintiff stored his lobsters in cars floating at his wharf in Boston. An adjacent wharf was a station for the disposal of garbage. Defendant independent contractor was hired to remove the accumulation of refuse matter under the disposal wharf. In performing his work, defendant polluted the surrounding water and weakened or killed many of plaintiff's lobsters. Plaintiff brought an action for damages to his lobsters caused by defendant's scraping of refuse matter under the garbage disposal wharf. The Supreme Judicial Court of Massachusetts sustained plaintiff's exceptions to the lower court's directed verdict for defendant. The court held that the negligence of defendant, polluting water by dredging under the disposal wharf, and the damaging of plaintiff's lobsters which were in cars in plain sight were proper considerations for the jury. (Powell-Florida)
W71-00515

MCGOWEN V CARR (RIGHT TO UNOBSTRUCTED FLOW OF WATER IN NATURAL WATERCOURSE).
272 Mass 573, 172 NE 787-788 (1930).

Descriptors: *Massachusetts, *Watercourses (Legal), *Ditches, *Obstruction to flow, Artificial watercourses, Channels, Conduits, Drainage, Drains, Water conveyance, Drainage systems, Drainage waters, Outlets, Flow, Watersheds (Basins), Natural flow, Springs, Spring waters, Judicial decisions, Relative rights, Channel flow.

Plaintiff brought an action to restrain defendant from obstructing the drainage flow of water across his land. Plaintiff contended that a ditch system, which transversed the parties' adjoining lands, was a natural watercourse and as such defendant had no right to obstruct the flow of the water in the ditch and cause it to back up upon plaintiff's land. Defendant contended that the ditch system was an artificial one designed to carry surface drainage and as such he was not prohibited from obstructing the ditch upon his property. The court found that the ditch system was a natural watercourse in that it carried off the overflow of various springs above the properties and did not merely carry off surface drainage. The plaintiff, having the right to a free flow of the water of a natural watercourse, was thus entitled to restrain defendant from obstructing such flow. (Snow-Florida)
W71-00516

HEINSE V THORBORG (DIVERSION OF NATURAL FLOW).
230 NW 881-882 (Iowa 1930).

Descriptors: *Iowa, *Obstruction to flow, *Natural flow, *Relative rights, Natural flow doctrine, Depression, Watercourses (Legal), Diversion, Diversion structures, Remedies, Judicial decisions, Legal aspects, Banks, Easements, Overlying proprietors, Surface waters, Surface runoff, Surface drainage.
Identifiers: *Swales.

Plaintiff landowner brought an action in equity to enjoin defendant neighboring landowner from allegedly diverting water onto plaintiff's land. Plaintiff claimed that the natural course of certain surface water was through defendant's land and that defendant had wrongfully diverted the water onto his land. Defendant argued that the natural course was through plaintiff's land and sought to prohibit plaintiff from obstructing such natural flow. The Supreme Court of Iowa found that the natural course was through plaintiff's land, thus making that property the subservient estate of defendant's dominant estate. The court further fuled that the subservient owner was under a duty not to obstruct the natural flow of water from the dominant estate. The trial court's ruling for defendant was affirmed. (Barker-Florida)
W71-00517

KYSER V NEW YORK CENT RR (RIPARIAN RIGHT TO MAKE REASONABLE USE OF RIVER'S WATERS).

151 Misc 226, 271 NYS 182-187 (1934).

Descriptors: *New York, *Water utilization, *Reasonable use, *Riparian rights, Competing uses, Consumptive use, Non-consumptive use, Diversion, Water pollution, Disposal, Impaired water quality, Pollutants, Wastes, Sewage, Water pollution sources, Sewage disposal, Judicial decisions, Rivers, Relative rights, Riparian waters.

Plaintiff brought an action for damages against defendant railroad company, an upper riparian owner, for unreasonable interference with plaintiff's riparian rights. Plaintiff contended that defendant unreasonably diverted waters from a river and discharged unreasonable quantities of sewage therein so as to hinder operation of plaintiff's sawmill located upon the river. Defendant contended that such use was not unreasonable. The court held that a riparian owner has a right to use and enjoy the benefits of a river and that such right includes a right to discharge a reasonable amount of sewage therein and to divert a reasonable quantity of water therefrom. Resultantly, a lower riparian's right to the use of a stream is a right qualified by the rights of upper riparians to make prior reasonable use of the waters. Whether or not use or detention of water by the upper riparian is unreasonable depends upon the peculiar circumstances of each case. From an examination of the evidence, the court found that defendant's diversion was relatively slight and that the sewage discharged was small so as to preclude a claim of unreasonable use. (Snow-Florida)

HOWLAND V UNION BAG AND PAPER CORP (RIPARIAN RIGHTS ATTENDANT TO OWNERSHIP OF NON-NAVIGABLE WATERCOURSE'S STREAMBED).
156 Misc 507, 282 NYS 357-367 (1935).

Descriptors: *New York, *Riparian rights, *Ownership of beds, *Natural flow, Riparian land, Non-navigable waters, Banks, Natural flow doctrine, Alteration of flow, Judicial decisions, Obstruction to flow, Beds, Relative rights, Riparian waters, Streambeds, Streams, Stream flow, Flow, Dams, Backwater.

In an action for damages, plaintiff contended that defendant corporation, by constructing a dam downstream, had violated his riparian right to the natural flow of the stream in that such dam retarded the stream's flow. Defendant contended that plaintiff was not in possession of any riparian rights since a railroad company had condemned for a right of way a portion of plaintiff's land appurtenant to the stream so as to sever any prior existing riparian rights. The court held that the condemnation by the railroad company did not affect plaintiff's riparian rights in that plaintiff still owned the bed of the non-navigable stream so as to entitle him to riparian rights even though he did not now own the bank of the stream. However, plaintiff could recover only nominal damages for the destruction of the riparian right since plaintiff was precluded from using the stream's bank, and thus was precluded from effectively using the stream. (Snow-Florida)
W71-00519

EWANSKI V SOLVAY PROCESS CO (LIABILITY FOR DEPOSITION OF INDUSTRIAL WASTE UPON LAND WHEN STREAM OVERFLOWS).
227 App Div 597, 238 NYS 508-512 (1930).

Descriptors: *New York, *Waste disposal, *Waste water disposal, *Overflow, Streams, Disposal, Wastes, Water pollution sources, Water pollution, Chemical wastes, Industrial wastes, Damages, Water pollution effects, Floods, Judicial decisions, Banks, Legal aspects.

In an action for damages, plaintiff contended that defendant manufacturing company deposited upon his land certain noxious and deleterious matter. Plaintiff contended that defendant discharged manufacturing refuse into a stream and that when such stream overflowed its banks in times of high water, the waste material was deposited on plaintiff's property, thus interfering with plaintiff's use of such property. Defendant recognized liability for such condition, but contended that the measure of damages was erroneously determined. The court held that there was no permanent injury to plaintiff's land and that therefore the effects of the nuisance was to be measured as the difference between the rental value before and after the waste was deposited upon the land. The court remanded the case for a redetermination of damages by such standard. (Snow-Florida)

W71-00521

CITY OF LOCKPORT V MCCOLLUM (RIGHT OF CITY TO ABATE NUISANCE CAUSED BY OBSTRUCTION TO STREAMFLOW).
235 App Div 106, 256 NYS 283-284 (1932).

Descriptors: *New York, *Obstruction to flow, *Stagnant water, *Abatement, Standing waters, Streams, Streamflow, Flow, Downstream, Judicial decisions, Riparian waters, Riparian land, Public benefits, Public health, Cities, Remedies.

In a per curiam decision, the court ruled that plaintiff municipality could abate a nuisance in the form of stagnant pools which resulted from the failure of defendant, a downstream riparian owner, to clean out a watercourse and remove obstructions which he had placed therein. Plaintiff could remove the obstructions placed in the stream by defendant provided it could be shown that a public nuisance existed. However, the facts before the court were insufficient to establish such a public nuisance, and the case was remanded for a new trial to determine such issue. (Snow-Florida)
W71-00522

HUDSON V CARMICHAEL (INJUNCTION TO PROHIBIT CONTINUED MAINTENANCE OF A DAM).
181 SE 853-856 (Ga 1935).

Descriptors: *Georgia, *Damsites, *Contracts, Backwater, Dams, Streams, Water levels, Weirs, Negotiations, Control, Retardance, Ponding, Reservoirs, Natural flow, Obstruction to flow, Dam construction, Electric power production, Remedies, Judicial decisions, Legal aspects.

Plaintiff landowner sought an injunction against defendant's maintenance of a dam which caused the water in a stream to back up on plaintiff's property. Defendant claimed that she had received permission for such ponding from plaintiff's predecessor in title and had orally contracted with plaintiff for continuing the operation of the dam. Plaintiff argued that such a contract was void because it dealt with an interest in land and as such was covered by the statute of frauds. The injunction was denied by the trial court, but the Supreme Court of Georgia reversed for a new trial, holding that certain testimony concerning the ultimate purpose of the dam being for electric power production was irrelevant and prejudicial to plaintiff's claim. (Barker-Florida)
W71-00523

HOOK V TOWN OF MEBANE (MUNICIPALITY'S LIABILITY FOR DIVERSION AND POLLUTION OF STREAM).
191 SE 407-413 (1926).

Descriptors: *North Carolina, *Water pollution effects, *Damages, *Reasonable use, Water pollution sources, Water pollution, Diversion, Riparian rights, Natural flow, Path of pollutants, Pollutants, Municipal wastes, Sewage odor, Public health, Diseases, Value, Cities, Streams, Remedies, Relative rights, Judicial decisions, Legal aspects.

Plaintiffs, riparian owners, operated a mill on a stream below defendant municipality. Defendant diverted the flow of the stream at one point and discharged sewage into the stream at another, both of which were upstream from plaintiffs' mill. Plaintiffs claimed that such diversion substantially impaired their riparian right to undiminished flow and that the sewage discharge created a nuisance. Defendant argued that the diversion was a reasonable use by an upstream owner and that its sewage system had been approved by proper health officials. The trial court found for plaintiffs and awarded damages for both allegations. The Supreme Court of North Carolina, affirming the lower court's ruling, held that the instructions concerning the riparian right to undiminished flow, subject to the reasonable use of upstream riparian owners, and the evidence concerning the alleged nuisance were properly submitted to the jury. Defendant was liable for the reduction in value of plaintiffs' property. (Barker-Florida)
W71-00524

MOSES V TOWN OF MORGANTON (JOINT LIABILITY OF SEVERAL POLLUTERS).
192 NC, 133 SE 421-424 (1926).

Descriptors: *North Carolina, *Remedies, *Water pollution sources, *Water pollution, Impaired water quality, Path of pollutants, Pollutant identification, Pollutants, Riparian rights, Wastes, Industrial wastes, Odor, Water pollution effects, Fishkill, Fouling, Color, Aesthetics, Effluents, Municipal wastes, Damsites, Dams, Cities, Organic wastes, Judicial decisions, Legal aspects.

Plaintiff landowner brought suit against defendants, a municipality, an electric power corporation, and a shoe manufacturer, for damages caused to a stream on plaintiff's property. Plaintiff claimed that the city had discharged effluents from its sewer system into the river and that the shoe company had emptied noxious animal remains into the creek above plaintiff's land. The power company had constructed a dam below plaintiff's property thus retarding the flow of the water and causing the waste matter to accumulate on plaintiff's land. Plaintiff brought one action against all three defendants, and defendant shoe company, an out of state corporation, sought removal to federal court on the grounds that defendants were not joint tort-feasors. The Supreme Court of North Carolina ruled that if parties, although acting independently, know or have reasonable ground to believe that their independent acts, combined with the independent acts of others, will create a result that will become a nuisance, and they do so cause damage, they become joint tort-feasors ab initio and are liable as joint tort-feasors. The removal was denied. (Barker-Florida)
W71-00525

LINEBERGER V RUBY COTTON MILLS, INC (INJUNCTION AGAINST SEWER MAINTENANCE).
146 SE 215-216 (NC 1929).

Descriptors: *North Carolina, *Sewers, *Damages, *Sewage disposal, Sewage effluents, Riparian waters, Streams, Riparian rights, Relative rights, Industrial plants, Industrial wastes, Water pollution, Water pollution sources, Remedies, Judicial decisions, Legal aspects.

Plaintiff landowner sought an injunction against defendant corporation's maintenance of its sewers whereby sewage was allegedly discharged into a creek which ran through plaintiff's land. Defendant argued that what damage may have been done to plaintiff's land and the creek was the result of action by others and that defendant was in no way connected to such damage. The trial court denied the injunction and the Supreme Court of North Carolina affirmed, saying that plaintiff had not met the burden of showing the trial court's finding of facts to be erroneous. (Barker-Florida)
W71-00526

ANDERSON V TOWN OF WAYNESVILLE (MUNICIPALITIES' LIABILITY FOR POLLUTION CAUSED BY SEWAGE DISCHARGE).
164 SE 583-88 (NC 1932).

Descriptors: *North Carolina, *Sewage disposal, *Water pollution, *Remedies, Water pollution sources, Water pollution effects, Damages, Impaired water quality, Path of pollutants, Pollutant identification, Pollutants, Wastes, Municipal wastes, Odor, Aesthetics, Effluents, Sewage, Cities, Lakes, Streams, Public health, Bacteria, Sewage baceria, Judicial decisions, Legal aspects.

Plaintiffs, a church corporation and several individuals, owned a lake used for church functions and various recreational activities. Defendant municipalities operated sewage systems which discharged raw sewage into a stream which emptied into the lake, thus causing severe pollution and a threat to health. Plaintiffs sought damages for the past actions of defendants and injunctions, both temporary and permanent, against further pollution of the lake. The trial court granted the relief sought, but the Suprme Court of North Carolina reversed. It was held that the facts determined by the lower court were not reviewable and that plaintiffs had not lost their cause of action by laches. However, the court held that only a preliminary mandatory injunction could be granted pending a ruling by the jury on the defendants' liabilities to plaintiffs for the alleged nuisance. (Barker-Florida)

WATKINS V PEPPERTON COTTON MILLS (PRESCRIPTIVE RIGHT TO DUMP SEWAGE).
134 SE 69-71 (Ga 1926).

Descriptors: *Georgia, *Water pollution, *Prescriptive rights, *Streams, Water pollution sources, Wastes, Water pollution effects, Abatement, Sewage effluents, Cesspools, Sewage disposal, Industrial plants, Legal aspects, Judicial decisions, Sewage sludge, Damages.

Plaintiff landowner sought an injunction against defendant cotton mills to prevent defendant from continuing to use its sewage system which emptied raw sewage into the creek which flowed across plaintiff's land. Plaintiff contended that defendant's sewage system was polluting the creek which plaintiff used for a public bathing pool and whose water plaintiff used for domestic purposes. Defendant contended that it had poured sewage into the creek at a point miles above the point at which it flowed into plaintiff's land for 26 years prior to the action and had thus acquired a prescriptive right to do so. Furthermore, defendant contended tat it was not the source of the pollution because its raw sewage would be purified by the time the creek reached plaintiff's land. The Supreme Court of Georgia held that defendant had acquired a prescriptive right to dispose of its sewage in the creek. (Quesada-Forida)
W71-00528

MOBILE AND O RR V RED FEATHER COAL CO (LIABILITY FOR OBSTRUCTION TO FLOW OF INTERMITTENT STREAM).
119 So 606-610 (Ala 1928).

Descriptors: *Alabama, *Riparian rights, *Embankments, *Flood damage, Boundaries (Property), Judicial decisions, Land tenure, Legal aspects, Natural flow doctrine, Proprietary power, Relative rights, Riparian land, Riparian waters, Usufructuary right, Watercourses (Legal), Damages, Excess water (Soils), Surface waters, Floods, Intermittent streams, Alteration of flow.

Defendant railroad's right-of-way crossed a stream which flowed across plaintiff's land on which several coal mine shafts were located. Defendant's trestle located on such right-of-way did not obstruct the streamflow until defendant constructed an earth embankment across the stream. The stream overflowed during 3 separate rainstorms as a result of said embankement, causing plaintiff's wells to be damaged by floodwater. Among other affirmative defenses, defendant offered proof that the stream was intermittent, being dry part of the year. The court held that injuries caused by obstructing and diverting the flow of waters constitute a private nuisance and are actionable as such. It further held that diverting waters from an intermittent stream is governed by the same rules of law as diverting those of a running stream. Defendant was granted a new trial, however, on the grounds that plaintiff had failed to mitigate his damages. (Clarke-Florida)
W71-00529

GREEN V PELICAN NATURAL GAS CO (DAMAGES FROM OIL WASTES).
163 So 431-433 (La 1935).

Descriptors: *Louisiana, *Damages, *Oil wastes, *Brine disposal, Boundaries (Property), Judicial decisions, Legal aspects, Land tenure, Proprietary power, Relative rights, Riparian rights, Watercourses (Legal), Discharge (Water), Oil wells, Flooding, Flood damage, Intermittent streams, Saline water, Overflow.

Defendant drilled oil wells near plaintiff's land. Salt and waste water from the wells caused an intermittent branch stream across plaintiff's land to overflow, thus destroying a small amount of pasture and timber. The court recognized plaintiff's right to damages for injuries to his land caused by such overflow. The court limited damages, however, to the value of the timber actually destroyed. The court found that there was no material decrease in the fair market value of the land because the slight damage to the pasturage was temporary. (Clarke-Florida)
W71-00530

RHODES V INTERNATIONAL PAPER CO (LIABILITY FOR DAMAGES CAUSED FOR DISCHARGE OF INDUSTRIAL WASTES).
174 La 49, 139 So 755-757 (1932).

Descriptors: *Louisiana, *Pulp and paper industry, *Pulp wastes, *Damages, Chemical wastes, Watercourses (Legal), Crop response, Waste water (Pollution), Chemicals, Flooding, Usufructuary right, Overflow, Basins, Pollutants, Pollutant identification, Creeks, Drainage water, Waste water disposal, Legal aspects, Judicial decisions, Water pollution.

Plaintiff landowner sought damages for injury to her land allegedly caused by defendant paper company's pollution of a stream traversing her property. Defendant contended that plaintiff had failed to prove that the damage to her property was due to the chemical wastes it emtied into the stream. After considering the record, the court held that plaintiff had failed to meet the required burden of proof. The judgment for plaintiff was set aside, and plaintiff's demands were rejected. (Price-Florida)
W71-00531

BOARD OF LEVEE COMM'RS V MANGUM (RIGHT TO HAVE STREAM FLOW IN NATURAL COURSE MAY BE EXPRESSLY OR IMPLIEDLY WAIVED).
153 So 820-823 (Miss 1934).

Descriptors: *Mississippi, *Pumping plants, *Flow augmentation, *Erosion, Alteration of flow, Levees, Flood control, Flooding, Flood prevention, Judicial decisions, Legal aspects, Watercourses (Legal), Mississippi River, Top soil Water level fluctuations, Seepage, Floodwater, Drainage programs, Riparian land, Riparian waters, Riparian rights, Flow rates.

Plaintiff landowner sought damages for erosion to his property caused by the increased velocity of the stream flow generated by defendant's pumping plant. Defendant contended plaintiff was estopped from recovering because he had requested that the capacity of the pumping station be increased and had acquiesced and consented to the construction of the plant. The court stated that the undoubted right of a riparian owner to have the free use of the flow of water through his lands may be waived, and he may so act as to be estopped from asserting his claim to damage because of the alteration of the course or manner of the flow f the water. This license may be implied or given in parol. The court held that plaintiff was so estopped, and the trial court's judgment for plaintiff was reversed. (Price-Florida)
W71-00532

JOHNSON V GIFFORD-HILL AND CO (LIABILITY FOR CHOKING OF STREAM CAUSED BY DEPOSITION OF SEDIMENT).
175 La 806, 141 So 842 (1932).

Descriptors: *Louisiana, *Water demand, *Deposition (Sediments), *Damages, Gravels, Watercourses (Legal), Judicial decisions, Legal aspects, Crop response, Relative rights, Riparian land, Riparian waters, Riparian rights, Sands, Streams.

Plaintiff landowner sought damages for crop loss, diminution in the value of his land, and loss of the operation of his cane mill. Such losses allegedly were cuased by the deposition of sand from defendant's gravel mill which choked the stream flowing by plaintiff's property. The court stated that there was little doubt as to defendant's liability, but that plaintiff took his damages too seriously. The five hundred dollars granted at the trial court was deemed sufficient to remedy plaintiff's water loss via the drilling of a well, and there would be some left over to compensate plaintiff for his crop disappointment. The trial court's judgment was affirmed. (Price-Florida)
W71-00533

GUILLORY V FONTENOT (PROPER USE OF FLOODGATES NOT AN OBSTRUCTION TO NATURAL DRAINAGE OF LAND).
170 La 345, 127 So 746-748 (1930).

Descriptors: *Louisiana, *Floodgates, *Flood irrigation, *Obstruction to flow, Watercourses (Legal), Drainage, Flooding, Irrigation, Impounded waters, Impoundments, Lakes, Diversion structures, Cultivated lands, Cultivation, Water storage, Artificial watercourses, Legal aspects, Judicial decisions.

Plaintiff upper landowner brought suit to have defendant lower landowner remove floodgates which allegedly obstructed the natural drainage of his property. Defendant contended that his floodgates were properly constructed and properly supervised during use, that his gates were never used until after plaintiff's lands were drained and that the use of his gates had never caused plaintiff damage. The court found that defendant's floodgates in no way impeded the current in the stream, that the gates were constructed by defendant's father at the request and with the consent of plaintiff and that plaintiff was now trying to evade the lawful contract he had previously entered with defendant's father. The judgment for defendant was affirmed. (Price-Florida)
W71-00534

WHEELER V RIVER FALLS POWER CO (LIABILITY OF POWER COMPANY FOR VIOLATION OF BOARD OF HEALTH'S REGULATIONS).
111 So 907-910 (Ala 1926).

Descriptors: *Alabama, *Diversion dams, *Impoundments, *Public health, Watercourses (Legal), Dams, Legislation, Impounded waters, Non-navigable waters, Diversion structures, Legal aspects, Judicial decisions, Regulation, Standards, Supervisory control (Power), Administrative agencies, Public utilities.

Plaintiff brought action against defendant power company alleging that the construction of a dam and impoundment of water by defendant was in violation of regulations of the state Board of Health and that such violations had caused plaintiff to become sick, and to suffer physical pain and mental anguish. The court stated that defendant was a corporation with the statutory power to construct dams and divert water from a non-navigable stream (as was involved in the instant case) if done in accordance with the regulations of the state Board of Health. However, the regulations allegedly violated were passed by a minority of the Board and were therefore invalid. The trial court's judgement for defendant was affirmed. (Price-Florida)

NAUVOO BLACK CREEK COAL CO V JOHNSON (LIABILITY FOR SUBSTANTIAL INJURY CAUSED BY STREAM POLLUTION).
For primary bibliographic entry see Field 05C.
W71-00536

STANDARD OIL CO V GOODWIN (FOULING OF LANDS BY ESCAPE OF SEDIMENT FROM STORAGE TANKS).
299 SW 2-5 (Ark 1927).

Descriptors: *Arkansas, *Damages, *Sediment discharge, *Sediment distribution, Watercourses (Legal), Levees, Oil, Pollutants, Pollutant identification, Riparian land, Riparian rights, Riparian waters, Oil fields, Oily water, Embankments, Fouling, Judicial decisions, Legal aspects, Industrial wastes.

Plaintiff landowner sought damages for injury to his property allegedly caused by the escape of crude oil and basic sediment from defendant oil company's storage pits. The sediment was carried across plaintiff's land via a natural watercourse. Defendant denied plaintiff's allegations and contended that any damage to plaintiff was temporary. Defendant also contended that the measure of damages, if any, should be the difference between the rental value of the land before and after the sediment deposition. The court held that the injury was permanent. The court ruled that the proper measure of damages was the difference between the fair market value of the land prior to and after the injury. The judgment for plaintiff was affirmed. (Price-Florida)
W71-00537

CHAPMAN V AMERICAN CREOSOTING CO (LIABILITY FOR POLLUTION OF WELLS AND SPRINGS).
286 SE 837-841 (Mo 1926).

Descriptors: *Missouri, *Creosote, *Water pollution sources, *Industrial wastes, Wastes, Water pollution control, Springs, Wells, Deepwells, Legal aspects, Judicial decisions, Waste water treatment, Subsurface waters, Remedies, Pollutants, Damages, Overflow.

Plaintiff landowner brought an action for damages against defendant corporation which plaintiff contended was polluting his well and spring by discharging creosoting wastes. Plaintiff contended that defendant negligently maintained its creosoting vats and that it allowed poisonous fluids to overflow into a ravine which led into plaintiff's land. Plaintiff sought damages for destruction of his grazing land, his water sources and his livestock, asserting that the waste products in his water sources were the proximate causes of such damage. Defendant contended that the overflow was caused by an unforeseen, unusually heavy rainfall which was an act of God. In holding for plaintiff, the court found that there was no evidence of extraordinary rainfall and that there was sufficient evidence upon which it could be found that defendant's creosote wastes had polluted plaintiff's wells and springs. (Quesada-Florida)
W71-00538

GREISINGER V KLINHARDT (IMPLIED EASEMENT FOR THE MAINTENANCE OF WATER LEVEL OF LAKE IN UPLAND LANDOWNER).
9 SW2d 978-983 (Mo 1928).

Descriptors: *Missouri, *Water levels, *Dams, *Easements, Concrete structures, Legal aspects, Judicial decisions, Diversion, Remedies, Diversion structures, Competing uses, Recreation, Relative rights, Riparian rights, Lakes, Overlying proprietor.

Plaintiff upper riparian landowner sought to enjoin defendant lower riparian landowner from draining the waters of an artificial lake. Plaintiff contended that a common grantor of plaintiff and defendant had constructed the dam which divided the lake

nto two parts, one of which was later sold to plain-tiff. Plaintiff further contended that by such divi-sion, the grantor had burdened the lower land and created an implied easement for the maintenance of the water level in the lake in favor of the upper andowner upon severance of the two portions by ale. Defendant contended that he was draining the water from the upper portion only to the extent necessary to effect repairs in the dam. The Supreme Court of Missouri held that plaintiff had acquired such an implied easement, and, upon find-ng that defendant had not in good faith lowered he level of the lake, issued an injunction prohibit-ng defendant from any further draining activities. (Quesada-Florida)
W71-00539

ATONIA REFINING CORP V DUSING (OIL REFINERY LIABLE FOR STREAM POLLU-TION).
46 Ky 328, 55 SW2d 23-26 (1932).

Descriptors: *Kentucky, *Damages, *Industrial wastes, *Water pollution, Water injury, Pollutant identification, Watercourses (Legal), Non-naviga-le waters, Creeks, Oily water, Legal aspects, Judi-ial decisions, Oil, Oil industry, Oil wastes, Water emand, Pollutants, Relative rights, Water pollu-on effects.

Plaintiff landowner sought damages for defendant il refinery's pollution of a stream which flowed hrough his property. Defendant emptied oily water nto the stream. During heavy rans, such water was ashed away and no accumulation occurred on the tream surface. During the year involved there was drought, and considerable pollution occurred. Defendant contended the pollution was an act of God. Had it rained as usual, no pollution would ave resulted from its actions. Defendant also con-ended there was no other way to operate its busi-ess and that adjoining landowners must yield to ome inconvenience caused by the use of its pro-erty. The court stated that one cannot provide the onditions for a disaster and then claim it was an ct of God. The court did not concede that defen-ant had a right to pollute the non-navigable tream on which it was located. The business was rought to the land, not placed there by nature, and o public necessity required t to be there. Damages ere held to be that amount necessary to fairly and easonably compensate plaintiff for the diminution the value and use of his property. The judgment r plaintiff was affirmed. (Price-Florida)
W71-00540

ORTON COAL MIN CO V WILKEY (POLLU-ION OF STREAM AND FARM BY COAL MIN-NG WASTES).
32 Ky 539, 23 SW2d 942-945 (1930).

escriptors: *Kentucky, *Water pollution, Streams, *Coal mine wastes, Farms, Agriculture, rops, Crop production, Water pollution sources, Vater pollution effects, Pollutants, Coal mines, ydraulic mining, Rent, Economic rent, Compen-tion, Legal aspects, Judicial decisions, Adjudica-on procedure, Industrial wastes.

aintiff landowner sued defendant coal mining mpany for damages from pollution injury. A ream coursed through plaintiff's land, and defen-nt discharged coal mining wastes into the stream. aintiff claimed damages for injury to his farm and ops caused by this pollution of the creek. In an peal on procedural issues, the court held that the idence presented was a sufficient standard for easuring damages, and that the damages awarded ere not excessive. The decision of the lower court r plaintiff was affirmed. (Hart-Florida)
71-00541

UNZE V CITY OF CAPE GIRARDEAU (LIA-LITY FOR STREAM POLLUTION BY MU-ICIPALITY).
SW2d 882-883 (Mo 1931).

Descriptors: *Missouri, *Water pollution, *Ease-ments, *Condemnation, Eminent domain, Sewers, Cities, Water pollution effects, Water pollution sources, Pollutants, Surface runoff, Storm drainage, Judicial decisions, Legal aspects, Adjudi-cation procedure, Runoff, Storm runoff, Excess water (Soils), Sewage effluents, Municipal wastes, Sewage disposal.
Identifiers: *Nuisance.

Plaintiff landowner sued defendant city for damages from pollution. Defendant condemned an easement across plaintiff's land to install a sewer line, and also condemned an easement in a stream which crossed plaintiff's land for the discharge of excess surface water mixed with sewer effluent in times of heavy rainfall. The sewer clogged, and de-fendant diverted the sewer into the stream continu-ously, surcharging the stream easement. Defendant contended that the condemnation proceeding was res judicata to the instant action, and that proof of negligence was required for the recovery of damages. The court held that since the instant ac-tion was only for damages resulting from the ease-ment surcharge, the condemnation proceeding was not res judicata. Furthermore, the court held that in actions for damages for injury from creation of a nuisance, proof of negligence was not required, and affirmed the lower court's judgment for plaintiff. (Hart-Florida)
W71-00542

SHELLEY V OZARK PIPELINE CORP (CHARACTERIZATION OF OIL PIPELINE LEAK AS TEMPORARY OR PERMANENT NUISANCE).

37 SW2d 518-523 (Mo 1931).

Descriptors: *Pipelines, *Oil, *Water wells, *Mis-souri, Water pollution sources, Oil industry, Oily water, Water pollution, Pollutants, Legal aspects, Judicial decisions, Adjudication procedure, Groundwater, Wells, Water supply, Damages, Compensation, Remedies, Farm ponds, Stock water, Leakage.
Identifiers: *Oil leaks.

Plaintiff farmers brought an action against defen-dant oil company to recover damages caused by oil leaking from defendant's pipeline on plaintiffs' pro-perty, thereby contaminating plaintiffs' water supply. Plaintiffs had already recovered in a prior action for similar damage but contended that a new leak had caused further damage since the prior ac-tion. Defendant argued that plaintiffs had alleged in the first action that the oil damage was a permanent nuisance and therefore were barred from bringing another action since they should have recovered all their damages in the first action, although they only recovered in part. Reversing a judgment for defen-dant, the court held that a pipeline leak was a tem-porary, rather than a permanent nuisance despite plaintiffs' allegations to the contrary. Therefore, plaintiffs could not have recovered for future damages in the first action and were not barred from bringing a second action. (Liptak-Florida)
W71-00543

CALIFORNIA OREGON POWER CO V BEAVER PORTLAND CEMENT CO (UNAP-PROPRIATED WATER UNDER THE DESERT LAND ACT AS SUBJECT TO STATE RULES OF APPROPRIATION).

295 US 142, 55 S Ct 725-732 (1935).

Descriptors: *Desert Land Act, *Appropriation, *Water rights, *Unappropriated water, Beneficial use, Public lands, Non-navigable streams, Govern-ments, Natural flow, Riparian rights, Legal aspects, Judicial decisions, United States, Reservation doc-trine, State jurisdiction, Arid lands, Reclamation, Obstruction to flow, Federal jurisdiction.

Plaintiff power company sued to enjoin defendant cement company from interfering with the natural flow of a stream which flowed between plaintiff's and defendant's property. Plaintiff argued that its patent from the United States carried with it the riparian right to the uninterrupted flow of water past its property. Defendant contended that, except for previously exercised rights, state legislation had established the rule of prior appropriation and since plaintiff had not put the water to any benefi-cial uses, defendant's right of appropriation was not restricted. Affirming a judgment for defendant, the court held that the Desert Land Act, establishing a rule of appropriation as to unappropriated water, was not binding upon the states. The final choice of a rule was left to the individual states. Therefore, the state court's interpretation of its own rule as one of appropriation, rather than one of riparian rights must stand. (Liptak-Florida)
W71-00544

BRAIDBURN REALTY CORP V CITY OF EAST ORANGE (WITHDRAWAL OF GROUND-WATER FROM CONDEMNED PROPERTY AS AN ELEMENT OF DAMAGES).
153 A 714-716 (NJ 1931).

Descriptors: *New Jersey, *Groundwater, *Draw-down, *Condemnation value, Water supply, Cities, Wells, Eminent domain, Percolation, Damages, Compensation, Legal aspects, Judicial decisions, Water table, Withdrawal, Consumptive use, Water demand, Legislation, Assessments, Relative rights.

Defendant city condemned plaintiffs' land primari-ly for the purpose of withdrawing the groundwater beneath the property to augment the city water supply. Plaintiffs claimed that they were entitled, not only to the value of the land taken, but also to damages to injury to their adjoining property resulting from the drawdown of the water level. The court held the plaintiffs, as condemnees, were entitled to recover for damage to their remaining land resulting from any use to which the con-demned land was to be put. Therefore, to the ex-tent that the withdrawal of water from the con-demned property interfered with plaintiffs' reasonable use of the groundwater subjacent to their remaining property, recovery was allowed. The case was remanded to the lower court for as-sessment of these damages. (Caldwell-Florida)
W71-00545

WHITE RIVER CHAIR CO V CONNECTICUT RIVER POWER CO (DEFENDANT'S DAM AL-LEGED TO HAVE RAISED WATER LEVELS, FLOODING PLAINTIFF'S PROPERTY).
162 A 859-872 (Vt 1932).

Descriptors: *Vermont, *Dams, *Seepage, *Sub-surface drainage, Flood damage, Overflow, Hydroelectric plants, Damages, Water levels, Dikes, Percolation, Legal aspects, Drainage, Groundwater movement, Saturation, Structures, Slopes, Relative rights, Flooding, Obstruction to flow, Judicial decisions, Subsurface flow, Diver-sion, Drainage effects.

Plaintiff corporation claimed that defendant power company's dam had so raised the water levels in the surrounding area as to cause seepage onto plain-tiff's property. Also, the natural drainage of the property was alleged to have been interfered with, resulting in plaintiff's basement being flooded and the soil being saturated. The court found no evidence to support plaintiff's claim that the dam had caused seepage directly onto the property from the dam's millpond. A lower court finding that dikes built to keep water from overflowing onto plaintiff's property were impervious to percolation was upheld. Plaintiff's contention that interference with the natural drainage of groundwater gave ground for relief was also rejected by the court, holding that rules granting recovery for obstruction of surface drainage did not apply to groundwater movement. Defendant was entitled to overflow his property up to the boundary with plaintiff's land, and any effect of such overflow on subsurface drainage was held non-compensable. (Caldwell-Florida)
W71-00546

JESSOP V PASSAIC VALLEY WATER COMM'N (PRIOR APPROPRIATION BY PREDECESSOR IN INTEREST ESTABLISHED ADVERSE USE WHICH PASSED TO SUCCESSOR).
174 A 254-257 (NJ 1934).

Descriptors: *New Jersey, *Prior appropriation, *Diversion, *Riparian rights, Relative rights, Reasonable use, Legal aspects, Judicial decisions, Competing uses, Consumptive uses, Water allocation (Policy), Water distribution (Applied), Water utilization, Industrial water, Water users, Natural flow, Water demand.

Plaintiff riparian landowner sought to enjoin defendant water commission from diverting water from the river at a point above where plaintiff diverted water for commercial uses. Plaintiff contended that defendant was interrupting the natural flow of the river and that it should cease such interruption or cause plaintiff's land to be condemned. Defendant claimed a prescriptive right to divert the water as the successor in title of a water company. The Court of Chancery of New Jersey haeld that while the period during which the predecessor to defendant diverted water could not be counted as part of any prescriptive period, the use of the water was competent evidence to show to what extent defendant's predecessor had acquired diversion rights by adverse use. On this basis, the court held that plaintiff was entitled to an injunction against a diversion in excess of the amount which defendant had acquired the right to divert from its grantor. (Quesada-Florida)
W71-00547

CITY OF JOHNSTOWN V FEARL (ATTEMPT BY CITY TO REMOVE STRUCTURES WITHIN CHANNEL LINES OF STREAM).
176 A 20-22 (Pa 1935).

Descriptors: *Pennsylvania, *Obstruction to flow, *Cities, *Structures, Legislation, Channel flow, Ownership of beds, Non-navigable waters, Boundary disputes, Boundaries (Property), Legal aspects, Eminent domain, Channels, Channel improvement, Riparian land, Condemnation, Compensation.

Plaintiff city sought, by having them declared a public nuisance, to remove structures constructed by defendant within the channel lines of a river. The court held that the structures were not public nuisances, and that defendant could not be forced to remove them through abatement proceedings. The proper procedure was for the city to condemn defendant's property and remove the structures after it had gained title to the land. Because the stream was non-navigable, defendant's property extended to the middle of the stream. The fact that a statute had declared the stream to be a public waterway was held not to have deprived defendant of his title to the streambed. The value of this property had to be taken into account in any future condemnation action. (Caldwell-Florida)
W71-00548

PURYEAR V NIELSON (EFFECTS OF SURFACE WATER DIVERSION ON ADJACENT LANDOWNER).
211 NW 676-677 (Minn 1927).

Descriptors: *Minnesota, *Damages, *Storm runoff, *Diversion structures, Surface waters, Ditches, Diversion, Sand pits, Runoff, Gravel, Flooding, Floodwater, Dikes, Topography, Basins, Judicial decisions, Legal aspects, Diversion losses, Surface runoff, Relative rights.

Plaintiff sued defendant for damages alleged to have resulted from defendant's construction of a ditch and dike to protect his premises from surface water. The court ruled that there was too much evidence indicating that water would have gone onto plaintiff's property, and his buildings surrounded by water, even if no ditch or dike had been constructed. The burden was on plaintiff to show not only his damage, but also that defendant's ditch was the cause of such damage. Since plaintiff failed to so prove, the judgment for plaintiff was reversed. FLOOD DAMAGE ABATEMENT-FEDERAL ASSISTANCE TO LOCAL GOVERNMENT.
Virginia Polytechnic Inst., Blacksburg. Water Resources Research Center.

Virginia Polytechnic Institute and State University Water Resources Center Bulletin 39, July 1970. 138 p, 3 append. OWRR Project A-999-VA (9).

Descriptors: *Flood control, *Flood plain zoning, *Planning, *Virginia, Cities, Urbanization, Flood protection, Economics, Surveys, Hydrologic data, City planning, Area redevelopment, Governments, Legislation, Non-structural alternatives.
Identifiers: Flood plain planning.

To assist local governments in Virginia in coping with flood problems, the Virginia Water Center organized a seminar to show that something could be done at the local level, to highlight the economics associated with flooding, to provide detailed information about the federal and state assistance available, and to hear the testimony of community leaders who have reduced their flood losses with the financial and technical assistance available. This bulletin contains the papers presented at the seminar. (Knapp-USGS)

THE LOCAL-STATE-FEDERAL TEAM APPROACH TO FLOODPLAIN MANAGEMENT,
Tennessee Valley Authority.
John W. Weathers.
In: Water Resources Bulletin, Vol 6, No 1, February 1970, p 106-109.

Descriptors: *Planning, *Coordination, *Flood plains, State governments, Cities, Institutions, Federal government, Non-structural alternatives, Tennessee River, Tennessee Valley Authority Project, Land management.
Identifiers: *Flood plain management, *Flood plain information.

Results of the establishment of a local Flood Relations program in 1953 by TVA are discussed. In sixteen years, TVA has produced local flood plain information reports for 126 communities. As of September 1, 1969, 66 valley communities had adopted both. The local-state-federal team approach to floodplain management is viable and any other appears to be doomed to failure. The floodplain management program can be expected to succeed as a collaborative effort by all levels of government, each playing a part and assuming the responsibilities best fitted to it. Most of us now accept that our flood problems will not be solved by engineering works alone or even in combination upstream land management. The solution requires a linking of broad community planning with traditional engineering works. This means that the local, state and federal objectives and policies must be effectively coordinated. This method has been developed and satisfactorily applied in the Tennessee Valley during the past decade. Since a working relationship with the people of the Valley and their state and local institutions had been carefully nutured for by TVA for over twenty years, it was only natural that the new program would also be a cooperative one. DETECTION AT A DISTANCE OF EMERGENCE OF THE GIRONDE BY INFRARED RADIOMETRY. RELATIONS WITH THE COASTAL DRAINAGE CHANNELS (IN FRENCH),
Alain Cazal, Pierre Pouchan, and Jean Vouve.
Comptes Rendus Academie des Sciences, Paris, Vol 270, No 6, Serie D, p 760-763, 1970. 1 fig, 4 ref.

Descriptors: *Analytical techniques, Spectroscopy, Infrared radiation, Remote sensing, Underground streams, Water, Temperature, Rivers, Hydrogen ion concentration, Estuaries, Water circulation.
Identifiers: River temperature bands, Thermal profiles, Gironde Estuary (France), Seudre River (France), Radiometry.

The use of the infrared radiometry permitted the detection of the enrichment of the Gironde estuary by hard water of underground currents possessing a higher temperature than that of the estuary. The equipment included a radiometer recording infrared radiation with wave length between 8 and 14 microns. A continuous recording of data registered by an airborne thermometric device was effected photographically. The assembly was equipped with a system of differential amplification and provided a sensibility of 0.05C. The technique encountered several obstacles, such as adjustment or calibration difficulties, complications due to currents of diversified nature, high air humidity, and limitations connected with the recording of solely surface temperatures. Nevertheless, the study was able to reveal the pattern of circulation of water flowing from the important network of the karstian plateau. (Wilde-Wisconsin)

DETERMINATION OF ORGANIC MATTER BY PERMANGANATE OXIDATION. XIII. CONTRIBUTION TO THE DETERMINATION OF OXIDABILITY OF PHENOLIC WATERS (IN CZECHOSLOVAKIAN),
Charlova Universita, Prague (Czechoslovakia).
Antonin Berka, and Zdenek Zavesky.
English summary. Chemicke Listy, Vol 63, p 1148-1152, 1969. 3 tab, 8 ref.

Descriptors: *Organic matter, *Water analysis, *Analytical techniques, *Oxidation, Phenols, Analysis, Chemistry, Effluents.
Identifiers: Potassium permanganate, Sodium carbonate, Sulfuric acid, Oxalic acid.

The oxidation of phenol containing substances by permanganate was conducted in 1 mole solution of sodium carbonate and subsequently in a solution acidified by sulfuric and oxalic acids. In a simplified version of the procedure, the titration is accomplished with 0.1 mole fraction potassium permanganate. The described method achieves a significantly higher degree of oxidation of phenolic compounds in comparison with the 4-hour iodometric analyses. (Wilde-Wisconsin)

PERMEABILITY OF CRYSTALLINE ROCK INTERPRETED FROM MEASURED ORIENTATIONS AND APERTURES OF FRACTURES,
Ceara Univ., Fortaleza (Brazil). Dept. of Geosciences; and Colorado School of Mines, Golden.
Luiz Bianchi, and David T. Snow.
Annals of Arid Zone, Vol 8, No 2, p 231-245, September 1969. 13 fig, 2 tab, 14 ref.

Descriptors: *Permeability, *Crystalline rocks, *Fractures (Geology), *Isotropy, On-site data collections, Theoretical analysis, Colorado, Geology, Hydrogeology, Mathematical models, Groundwater, Instrumentation, Sampling, Rocks.
Identifiers: *Rock apertures, *Groundwater exploration, Penetrants.

Accelerating demands for groundwater supplies have created an increased interest in the subject of fractured crystalline rock permeability. A mathematical model of intersecting plane conductors approaches real fracture geometry, affording insight into its permeability characteristics. The theory is used to compute the permeability of Pike's Peak Granite from observed orientations and measured apertures. A line sampling method was utilized in which a maximum number of fractures could be measured. The sampling line was oriented in the direction of central tendency of the normals to the fractures and it was assumed that fracture frequencies and orientations beyond the sampling line were identical to those along the sample. Sampling lines along outcroppings were established with surveyors tape at 59 sampling stations. A penetrant-photographic method was used for measurement of fracture apertures and its strengths and weaknesses are discussed. It was found that apertures were log normally distributed and the surface apertures were much larger than subsurface apertures but size predictability at various depths was impossible from the data. Until measurements can be made in depth in undisturbed rock, direct permeability computations cannot be made. However, an extensive mathematical method for estimating permeabilities from fracture orientations is described. (Casey-Arizona)

REMOTE SENSING BIBLIOGRAPHY FOR EARTH RESOURCES, 1966-67,
Geological Survey, Washington, D.C.
Rita K. Llaverias.
Available from NTIS as PB-192 863, $3.00 in paper copy, $0.95 in microfiche. Geological Survey Interagency Report-189, May 1970. 127 p, 412 ref, 4 index.

Descriptors: *Bibliographies, *Remote sensing, *Information retrieval, *Water resources, Publications, Aerial photography, Agronomic crops, Forestry, Geomorphology, Geologic investigations, Glaciation, Hydrologic data, Meteorological data, Instrumentation, Methodology, Oceanography, Range management, Soil classifications, Urbanization, Satellites (Artificial).
Identifiers: *Earth resources data, Photographic techniques.

This is the second in a series of bibliographies on remote sensing of earth resources applications. The subject matter coverage is extended from the earlier more restricted area of hydrology to the broader field of earth resources, but the emphasis on water resources applications remains. Citations are given for 412 literature items appearing in 1966-1967, and represent such fields as agriculture, forestry, geography, geology, hydrology, meteorology, oceanology, range management, and urban planning. Indexes are provided for personal and corporate authors and subject. Each citation has three key word descriptors. (Lang-USGS)

Louisiana State University Coastal Studies Institute Bulletin No 4, p 73-76, February 1970. 4 p, 3 fig, 2 ref. ONR Contract Nonr 1575 (03), NR 388 002.

Descriptors: *Water level fluctuations, *Gages, *Waves (Water), Electrical equipment, Conductivity, Instrumentation, Beaches, Tides, Surf, Surveys, On-site tests.
Identifiers: Wave gages.

A resistance-wire gage was developed for measuring water level fluctuations, including waves, in shallow waters. The stainless-steel wire is set in a spiral groove cut in 3/4 inch PVC pipe. Because the wire is protected in a groove in the PVC pipe, the staff is much more rugged and more safely portable than are the classical wave staffs where the wire is simply stretched between two insulating end posts. In addition, the spiral groove means that there is a large length of wire per unit length of staff, so the staff is electrically linear to within 1 percent after only 4 inches of staff is submerged. The high resistance per unit length produces a large output voltage with a small power supply, permitting use of the very simple and inexpensive oscillator and detector circuits shown. The circuit uses readily available parts and has the advantages of reliability, portability (with a 12-volt auto battery as power source), low current drain (less than 1 amp), and stability. A NEW 'BASELESS' PROPORTIONAL WEIR,
Indian Inst. of Science, Bangalore (India). Dept. of Civil and Hydraulic Engineering.
N. S. Lakshmana Rao, and D. Chandrasekaran.

Also published in French. Journal of Hydraulic Research, Vol 8, No 3, p 341-355, 1970. 15 p, 6 fig, 3 plate, 2 tab, 7 ref.

Descriptors: *Discharge measurement, *Weirs, Discharge (Water), Water levels, Stage-discharge relations, Data collections, Water measurement, Flow measurement, Stream gages.
Identifiers: Proportional weirs.

The proposed new weir has some definite advantages over other types of weirs such as the exponential, logarithmic, sutro, quadratic, rectangular, triangular and parabolic weirs. Experimental verification of the head discharge relation is made for a typical weir and the coefficient of discharge is found to be 0.60. (Knapp-USGS)
W71-00359

REPEATABILITY OF THREE INSTRUMENTS USED TO DETERMINE THE UNDRAINED SHEAR STRENGTH OF EXTREMELY WEAK, SATURATED, COHESIVE SEDIMENTS,
Naval Oceanographic Office, Washington, D.C.
Joseph H. Kravitz.
Journal of Sedimentary Petrology, Vol 40, No 3, p 1026-1037, September 1970. 12 p, 6 fig, 3 tab, 30 ref.

Descriptors: *Test procedures, *Sediments, *Shear strength, *Instrumentation, Mechanical properties, Materials testing, Testing, Analytical techniques, Statistics, Quality control, Measurement.
Identifiers: Fall cone, Vane shear-testing, Torvane, Weak sediments.

Relative repeatability studies were made of the fall cone, motorized laboratory vane and torvane, when testing the undrained shear strength of extremely weak, saturated, cohesive sediments. The 26 sediment samples tested were collected from an artificial settling pond, tested for shear strength and analyzed for their chemical, mineralogical and physical properties. The fall cone showed the best repeatability with the motorized laboratory vane next and the torvane last. The individual repeatability of all three devices when testing extremely weak sediments is poor. Differences among the instruments were not significant at the 5 percent level. Instrument characteristics and testing methods rather than sediment characteristics are most likely responsible for differences among the instruments and for the low repeatability. None of the instruments are especially well suited for testing extremely weak sediments. Because of its greater repeatability the fall cone is preferred to the other two devices. (Knapp-USGS)
W71-00389

REMOTE SENSING FOR RESOURCE MANAGEMENT AND FLOOD PLAIN DELINEATION,
Wisconsin Univ., Madison. Dept. of Soil Science.
C. J. Milfred, D. E. Parker, and G. B. Lee.
Available from NTIS as PB-195 086, $3.00 in paper copy, $0.95 in microfiche. Reprint, Presented at the 24th Midwestern States Flood Control and Water Resources Conference, May 21-22, 1969, Milwaukee, Wisconsin. 17 p. OWRR B-002-WISC (11).

Descriptors: *Flood plain zoning, *Hydrologic data, *Soil surveys, *Aerial photography, Remote sensing, Radar.
Identifiers: Multiband photography, Infrared sensors, Multispectral sensors.

Remote sensing is becoming an extremely important research tool in modern resource management techniques. Water resource managers can use remote sensing systems to provide supplemental information in regions where planning has been hampered by the lack of suitable hydrologic data and other resource information. Continued pressure for encroachment and development on flood plains will generate a need for more comprehensive planning based on timely and accurate information about an entire river basin or watershed. With respect to flood plain delineation, remote sensors cannot be used to predict the height of future floods. They can provide information to indicate areas that have flooded which should help improve flood predictions based on theoretical models. Remote sensors offer a dynamic resource inventory system which can be used to complement traditional detailed studies and serve as an important source of information in regions where detailed studies are not available. Remote sensors generate a great deal of data and there is danger of accumulating more information than can be utilized. This problem can be largely overcome by maintaining a close working relationship between scientists working on applications of the sensors and resource managers who will use the information to help solve important natural resource problems.

BRIEF DESCRIPTIONS OF AND EXAMPLES OF OUTPUT FROM COMPUTER PROGRAMS DEVELOPED FOR USE WITH WATER DATA IN KANSAS,
Geological Survey, Lawrence, Kans.
Brent H. Lowell, Charles O. Morgan, and Jesse M. McNellis.
Kansas Geological Survey Special Distribution Publication 48, 1970. 54 p, 41 fig, 17 ref, append.

Descriptors: *Computer programs, *Data processing, *Hydrogeology, *Kansas, Hydrologic data, Water level fluctuations, Streamflow, Regression analysis, Mapping, Suspended load, Bed load, Sediment transport, Statistics, Statistical methods, Hydraulics, Channel morphology.
Identifiers: Water data computation.

Programs written in FORTRAN IV language were developed in the Kansas District of the U.S. Geological Survey to handle basic water data by use of the digital computer. The programs check, tabulate, graph, map, and statistically analyze data derived from hydrologic and geologic investigations. This report contains brief descriptions of and output from some of the digital computer programs. It is not meant to give detailed program information, but rather to acquaint the reader briefly with many of the programs that are currently available in Kansas for use with water data. All programs are written in FORTRAN IV programming language and are operational on the GE 635 computer at The University of Kansas Computation Center. The described programs can be used, with minor adaptations, on any computer with a FORTRAN IV compiler. Operational programs are separated into three general groups; checking and tabulation programs, standard analysis programs, and other programs. Additional programs that are in the development stage include: a program for performing a multitude of operations on water-level records including change maps for selected periods and regression analysis, a program for plotting graphically the suspended- and bed-load sediment data, and a program to treat statistically the parameters considered in hydraulic geometry of channels. T-WAVE, A COMPUTER CODE FOR ANALYZING THE NONSTEADY GRAVITY DECAY OF A GROUNDWATER ANOMALY,
California Univ., Livermore. Lawrence Radiation Lab.
John A. Korver.
Available from NTIS, as TID 4500, UC 35, price $3.00 paper copy, $0.95 microfiche. California University, Lawrence Radiation Laboratory UCRL-50830, March 16, 1970. 59 p, 3 fig, 2 ref, 5 append.

Descriptors: *Computer programs, *Mathematical models, *Water levels, *Groundwater movement, Water level fluctuations, Infiltration, Tracers, Permeability, Porosity, Hydrogeology.
Identifiers: T-Wave, Groundwater mounds.

The T-WAVE code is based on a one-dimensional numerical model describing the gravity decay of a groundwater mound. The Fortran program for the T-WAVE Code may be used to examine the time-dependent flow characteristics of anomalous groundwater mounds resulting from underground nuclear explosions near or below the regional water table. The code allows the permeability and porosity to be in either a cylindrical or spherical geometry surrounding the shot point, and it also allows for internal horizontal or vertical discontinuities of the permeability or porosity. It also possible to follow the horizontal displacement of ideally tagged water particles as a function of time. (Knapp-USGS)

OCEANS IV: A PROCESSING, ARCHIVING AND RETRIEVAL SYSTEM FOR OCEANOGRAPHIC STATION DATA,
Department of Energy, Mines and Resources, Ottawa (Ontario). Marine Sciences Branch.
M. E. Sweers.
Canada Department of Energy, Mines and Resources, Marine Sciences Branch Manuscript Report Series No 15, 1970. 137 p, 62 fig, 15 tab, 22 ref.

Descriptors: *Data storage and retrieval, *Computer programs, *Oceanography, Marine geology, Oceans, Data collections, Hydrologic data, Data processing, Information retrieval, Networks, Stations, Meteorological data, Gravity, Geophysics, Water temperature.
Identifiers: Oceanographic data.

OCEANS IV is a powerful system of programs used by the Canadian Oceanographic Data Centre to manage its oceanographic station data file. This file, at present, contains 30,000 stations consisting of, on the average, 10 observed levels each. The data are stored in geographical order on magnetic tape. The system can accept up to 35 different physical and chemical parameters in a partically open ended format. To date only 16 parameters have been assigned codes. The four basic functions of the OCEANS IV system are: (1) processing of reversing thermometer readings; (2) preparing temperature, salinity and chemical data for archival in the oceanographic station data file; (3) printing data reports on request; and (4) providing flexible retrieval of data from the file. (Knapp-USGS)
W71-00352

AUTOMATIC DEVICE FOR PLOTTING PROFILES OF HYDRAULIC MODELS,
Alberta Univ., Edmonton. Dept. of Electrical Engineering.
V. J. Kingma.
Also published in French. Journal of Hydraulic Research, Vol 8, No 3, p 329-339, 1970. 11 p, 7 fig, 1 ref.

Descriptors: *Hydraulic models, *Instrumentation, Sediment transport, *Profiles, *Channel morphology, Data collections, Light, Water levels, Sedimentary structures, Dunes, Ripple marks, Alluvial channels, Measurement.
Identifiers: Optical water-level measurement.

An optical probe is used as the sensor of an automatic hydraulic model contour follower. The sensor consists of a light source, a split lightpipe, and a photodiode. With an electromechanical servo system the probe is kept at a fixed, small distance from the contour to be measured. As the servo driven probe assembly is moved across the mode, output signals proportional to the horizontal and vertical displacements are fed into an X-Y plotter, thus producing a profile of the model. The accuracy is better than 0.8 mm. (Knapp-USGS)

ON THE DESIGN AND CONSTRUCTION OF INFILTRATION GALLERIES,
Truman W. Bennett.
Groundwater, Vol 8, No 3, p 16-24, May-June 1970. 9 p, 1 fig, 8 ref.

Descriptors: *Galleries, *Infiltration, Drainage, Drains, Water yield, Drainage engineering, Recharge, Drawdown, Aquifer characteristics, Well screens, Pipes, Filters, Design, Construction, Sumps, Wells, Operation and maintenance, Subsurface drains, Subsurface drainage.
Identifiers: Drain filters, Pumping tests, Infiltration rate, Filter criteria, Construction methods.

Present knowledge regarding factors controlling yield and maintenance requirements of infiltration galleries permits a more accurate evaluation than is generally employed. Pump test procedures and the analysis necessary for a reliable prediction of the yield of infiltration galleries are outlined. Gallery design, including pipe size, pipe materials, slot size, filter materials, and sump size, is discussed. Gallery construction by installing permeable conduit in an open excavation and backfilling and by pipe projection from a central caisson are discussed. Rules for successful operation and maintenance procedures for the most prevalent difficulties occurring in gallery installations are suggested. (USBR)

DESIGN OF CARTERS PUMPED STORAGE PROJECT,
Army Engineer District, Mobile, Ala.
Walter W. Burdin.
Proceedings, American Society of Civil Engineers, Journal of the Power Division, Vol 96, No P03, p 383-400, June 1970. 18 p, 9 fig, 1 tab, 12 ref, append.

Descriptors: *Multiple-purpose projects, Recreation, Geology, Design, *Electric power production, Flood control, Rockfill dams, Construction, Reservoirs, *Pumped storage, Penstocks, Hydraulic turbines, Costs, Pump turbines, Georgia, Spillways, Hydroelectric plants, Earth dams.
Identifiers: *Carters Project (Ga).

The Carters Project is under construction on the Coosawattee River about 75 mi north of Atlanta, Ga. When completed in 1974, the project will consist of a 440-ft-high, rockfill main dam with a powerhouse on the right bank, an emergency spillway on the left bank, and a low, earth and rockfill reregulation dam about 2 mi downstream of the main dam. The powerhouse, of conventional enclosed design, will contain 4 units. Nominal generator rating for each of the 4 units is 125,000 kw. The 2 conventional Francis turbines are rated at 172,000 hp at 345 ft net head and 163.6 rpm. The 2 pump-turbines are rated as turbines at 173,000 hp at 345 ft net head and as pumps at 4,435 cfs at 347 ft total head, both at 150 rpm. Normal operating head at maximum power pool elevation 1072.0 will be about 385 ft. The multipurpose project is being developed for flood control, recreation, and power. The geology, hydrology, and design of the project are discussed. (USBR)
W71-00270

EFFECT OF SAFETY FACTOR AND CONCRETE STRENGTH ON COST OF ARCH DAMS,
Harza Engineering Co., Chicago, Ill.
Roman P. Wengler.
Paper, Conference on Rapid Constr of Concrete Dams, Pacific Grove, Calif, Mar 1970. 9 p, 3 tab.

Descriptors: *Arch dams, *Safety factors, *Dam design, *Costs, Stress, Safety, Dam construction, Yield point, Volume, Formwork (Construction), Cooling, Cost comparisons, Hydrostatics, Temperature, Loads (Forces), Stability, Concrete dams, Dams.
Identifiers: Concrete properties, Design strength, Ultimate strength, Cooling systems, Cost savings.

A study made to determine the effect on cost of arch dams for various safety factors concluded that if the safety factor is to be reduced, keeping the concrete strength constant and reducing concrete volume are definitely more advantageous than keeping the concrete volume constant and reducing strength. If the concrete strength is kept constant and volume is reduced, a savings of 12% is achieved by reducing the safety factor from 4 to 3 and 22% by reducing it from 4 to 2. The effect on cost of increasing the concrete strength while keeping the safety factor constant was small. The question arises as to whether or not a safety of 4 at one yr as traditionally defined is really necessary. This is a complex question involving a multitude of intangibles. Safety factors are used to build in provisions for all underlying uncertainties. The safety factor probably could be decreased as the uncertainties decreased because of improvement in design and construction techniques and improvement of instrumentation measurement techniques for studying prototype behavior of dams. While this alone may not be adequate justification for reducing safety factors, the question seems to warrant further discussion. (USBR)
W71-00272

SMALL WELLS MANUAL--A MANUAL OF LOCATION, DESIGN, CONSTRUCTION, USE AND MAINTENANCE,
Minnesota Univ., Minneapolis. Div. of Environmental Health.
Ulric P. Gibson, and Rexford D. Singer.
Department of State Agency for International Development (AID) Manual, 2nd Printing, Sep-

tember 1969. 156 p, 108 fig, 3 tab, 23 ref, 2 append.

Descriptors: *Water wells, *Drilling, *Water resources development, Pumps, Pumping, Rotary drilling, Well screens, Well casings, Well filters, Water quality, Water yield, Water supply, Water pollution control.
Identifiers: Small wells manual, Well design, Well construction.

This manual is intended to serve as a basic introductory text book and to provide instruction and guidance to field personnel engaged in the construction, operation and maintenance of small diameter, relatively shallow wells used primarily for individual and small community water supplies, particularly in developing parts of the world. It is aimed particularly at those persons who have had little or no experience in the subject. An attempt has been made to treat the subject matter as simply as possible in order that this manual may be of benefit not only to the engineer or other technically trained individual (inexperienced in this field) but also the individual home owner, farmer or non-technically trained community development officer. This manual should also prove useful in the training of water well drillers, providing the complementary background material for their field experience. (Knapp-USGS)

W71-00433

HAZARDS TO PEOPLE AND ANIMALS FROM BUREAU-CONSTRUCTED CANALS, OPEN AND CLOSED CONDUIT SYSTEMS PROGRAM,
Bureau of Reclamation, Denver, Colo. Office of Chief Engineer.
Howard Latham, and James M. Verzuh.
Available from NTIS as PB-190 005, $3.00 in paper copy, $0.95 in microfiche. January 1970. 48 p. REC-OCE-70-2.
Identifiers: *Inland waterways, Hazards, Safety, Animals, Drowning, Water supplies, Humans, Irrigation systems, Economics, Construction.

Approximately 30 people drown in Bureau-constructed canals annually. An undetermined number of animals (mostly deer) also drown in these canals. Losses could be eliminated at considerable expense by covering existing canals or by placing them in buried conduits. Human and animal losses can be reduced at moderate expense by constructing adequate fencing. A survey of human drownings and a review of safety practices and policies are presented. Data relating to animal losses are provided. Unit costs of placing canals in buried conduits, covering canals and fencing canals are illustrated. Other suggested safety solutions, such as using stepped or corrugated canals linings and allowing canals and rights of way to be used for recreational purposes are examined. Recommendations for reducing drownings are given.
W71-00437

INVESTIGATION OF SOIL-STRUCTURE INTERACTION: FLEXIBLE CULVERT PIPES,
Ohio State Univ., Columbus. Engineering Experiment Station.
T. H. Wu.
Available from NTIS as PB-193 112, $3.00 in paper copy, $0.95 in microfiche. Interium Report EES-279-2. September 1969. 120 p.
Identifiers: *Roads, Sands, *Structures, Drainage, Interactions, Shear stresses, Pipes, Deflection, Compressive properties, Strain (Mechanics), Flexible structures, Mathematical models, Ohio, *Culverts, Soil stabilization.

Triaxial and 'trapdoor' tests were conducted on a sand to determine its stress-strain properties. Results of tests by Waterways Experiment Station and others are included in the report. Measured stresses compared closely to computed stresses. Computed deflections were many times greater than measured deflections for an undetermined reason. The report includes a print out of a finite element computer program developed by Brown of California and modified by the researchers to take into account nonlinear soil properties. Using the program, preliminary calculations were made for one set of conditions to illustrate the nature of results obtainable.

THERMAL ANALYSIS OF ABOVE-GROUND LIQUID DISTRIBUTION SYSTEMS (UTILIDORS) FOR POLAR APPLICATION,
Naval Civil Engineering Lab., Port Hueneme, Calif.
C. K. Smith.
Available from NTIS as AD-707 695, $3.00 in paper copy, $0.95 in microfiche. Technical Note N-1090, May, 1970. 34 p.
Identifiers: *Polar regions, Pipes, *Pipes, Thermal insulation, *Thermal insulation, Thermal analysis, Freezing, Structural shells, Configuration, Heat transfer, Mathematical models, Numerical analysis, Computer logic, Computer programs, Utilidors, Computer analysis.

In polar regions, service distribution pipes for water, sewage, and heating present special problems becuase they cannot be buried in the normal manner. One solution to this problem is to install an above-ground utilidor, which consists of a thermally insulated box-like structure through which the service lines run. One or more of the service lines provides the source of heat necessary to avoid freezing of all the other lines. A basic proolem in utilidor design is that the system must provide sufficient thermal protection to avoid freezing during coldest weather, but the temperatures of the liquids being distributed must not become undersirably high during warm weather. Therefore, thermal performance must be analyzed at both extremes of ambient and operating conditions before the utilidor design for a particular site is finalized. The document presents a general analysis and resulting computer program suitable for prediction of the thermal performance of various multi-pipe utilidor designs over a wide range of boundary conditions. The computed results are shown to compare favorably with experimental data for a particular design. The computer program is described, and sample calculations are presented.

STANDARD UTILITY LOCATIONS FOR THE CITY OF PHOENIX.
Standard Utility Locations Committee, Phoenix, Ariz.

June 1970. 17 p, 20 fig.

Descriptors: *Utilities, *Urbanization, *Locating, *Municipal water, *Municipal wastes, *Sewers, *Right-of-way, *Road design, *Water conveyance, *Public utilities, *Distribution systems, Irrigation systems, Trenches, Conduits, Pipes, Design standards, Cross-sections.
Identifiers: *Utility locations, *Utility standards, *Standard utility locations, Phoenix.

Standards are described that will serve as guidelines for the installation and relocation of all utility services within public rights-of-way in the City of Phoenix. Very few municipalities in the United States have adopted comprehensive utility location standards and fewer have been published. Because of urban growth and added demands for public services such as potable water, irrigation water, sewerage, power, communication, heating fuel and others, more efficient use must be made of underground and aboveground space in public rights-of-way. It is also desirable to locate utility services so that street cuts and traffic interference are minimized. The report specifies the required location of utility conduits, pipes, cables, or poles in typical street types by means of cross-sectional sketches. The standards require a minimum thirty inches of cover over all underground utilities located in paved areas of streets, except for irrigation water pipe which must have eighteen inches. Domestic water lines, and sanitary and storm sewers are always placed in the street area along major and collector routes, whereas irrigation water lines are located in the sidewalk area. Along local streets, domestic water lines are located beyond the sidewalk, adjacent to property lines; however, sewers are within the street area. Sanitary sewers are also permitted in alleys and on easements. (Poertner)

WATER WAVE PRESSURE ON HORIZONTAL PLATE,
Delaware Univ., Newark. Dept. of Civil Engineering.
Hsiang Wang.
Work supported by DASA. ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY 10, Paper 7629, p 1997-2017, October 1970. 21 p, 14 fig, 1 tab, 16 ref, append.

Descriptors: *Waves (Water), *Uplift pressure, *Shore protection, Standing waves, Hydraulics, Energy, Surges, Erosion, Erosion control, Pressure.
Identifiers: Water wave pressure.

Simple rules are developed to estimate the maximum uplift pressures induced on the underside of a flat plate by various types of incident waves. Theoretical prediction techniques are provided for both the slow-rise pressure component and the fast-rise pressure component (impact) for different incident waves: standing waves, regular progressive waves, and dispersive waves, all in constant water depth. Laboratory experiments were conducted in a dispersive wave basin partially to check the validity of prediction techniques and partially to provide additional information so that the prediction techniques can be extended empirically to cover the more complicated but more practical

situation of a plate in shoaling water. The fast-rise pressure should be of engineering concern not only because the magnitude of its peak is enormous but also because the magnitude of the corresponding impulse is significant. The slow-rise pressure component was found to range from one to two times the hydrostatic pressure. (Knapp-USGS)
W71-00019

PREDICTING CONCENTRATION PROFILES IN OPEN CHANNELS,
Geological Survey, Fort Collins, Colo.; and Iowa Univ., Iowa City. Inst. of Hydraulic Research.
Harvey E. Jobson, and William W. Sayre.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY 10, Paper 7618, p 1983-1996, October 1970. 14 p, 8 fig, 1 tab, 12 ref, append.

Descriptors: *Sediment transport, *Turbulent flow, *Open channel flow, *Dispersion, Diffusion, Mass transfer, Turbulence, Sedimentation, Path of pollutants, Settling velocity, Model studies, Flumes, Hydraulic models, Mathematical models, Mixing, Computer programs.
Identifiers: Waste dispersion.

A steady state two-dimensional conservation of mass equation is solved numerically in order to describe the process of vertical mass transfer for both neutrally buoyant liquid and suspended sediment particles in an open channel flow. The relevancy of the equation is illustrated by comparing its solution with laboratory data obtained from experiments conducted in a large flume. The solution is then used to graphically illustrate the effects of various hydraulicparameters on mass transfer. Parameters investigated include the velocity distribution, the magnitude and distribution of the turbulent mass transfer coefficient, the particle fall velocity and the boundary conditions at the channel bed. The solutions indicate that the fall velocity controls the rate of descent of the dispersant mass but has little effect on the rate of spread of the dispersant. Conversely, the transfer coefficient controls the rate of spread of the dispersant but has little effect on its rate of descent. The most striking conclusion drawn from this study is that the dispersant distribution is not very sensitive to the distribution of the turbulent mass transfer coefficient. (Knapp-USGS)
W71-00020

VIRTUAL MASS OF PLATES AND DISCS IN WATER,
Frederic T. Mavis.
ASCE Proceedings, Journal of the Hydraulic Division, Vol 96, No HY 10, Paper 7593, p 1947-1952, October 1970. 6 p, 4 fig, 4 ref, append.

Descriptors: *Settling velocity, *Particle shape, Hydraulics, Laboratory tests, Viscosity, Instrumentation, Photography.
Identifiers: Virtual mass.

A method of studying virtual mass of plates and discs in linear-accelerated motion involves: (1) simple apparatus for strobophotographic recording of small displacements at the rate of 500 per sec within a test interval of 1/25 sec under the same initial force; and (2) analysis of data from wet and dry tests plotted on a trilinear chart with displacement as ordinate, mass as abscissa, and time intervals as parameter. Variability of data is reported. (Knapp-USGS)

WAVE-HEIGHT PREDICTION FOR WAVE GENERATORS IN SHALLOW WATER,
Army Coastal Engineering Research Center, Washington, D.C.
Cyril J. Galvin, Jr.
Available from NTIS as AD-440 880, $3.00 in paper copy, $0.95 in microfiche. Technical Memorandum No. 4, Mar. 1964. 21 p.

Descriptors: *Beach erosion, *Shallow water, *Hydro dynamics.
Identifiers: *Wave-height, Wave generators, *Wave tanks.

The height of wave generated by displacement type wave generators in shallow water is approximately equal to 2piS/L times an appropriate dimension of the wave generator. S is the stroke of the wave generator, L is the wave length given by the small-amplitude theory, and the wave generator dimension is measured perpendicular to S. This relation agrees with the hydrodynamic theory for piston and flap-type wave generators over the range of relative depths usually used in coastal engineering experiments, and it agrees with data from four piston-type and two flunger-type wavegenerators for depths satisfying the condition (2piD/L) less than 1. This method of wave-height prediction can shorten the time spent on many coastal engineering experiments.

CONSTRUCTION RECOMMENDATIONS, DESIGN CRITERIA AND THEIR APPLICATION,
Gabriel A. Echavez.
Transl from Spanish of Bur Reclam Transl 841, July 1970. 10 p, 3 fig, 2 tab. Nat Univ Mex, Inst Eng, No 226, p 151-161, Aug 1969.

Descriptors: *Cavitation, Erosion, *Spillways, Aeration, Construction, *Tunnels, *Design criteria, Roughness (Hydraulic), Fluid flow, *Pressure head, Vaporization, Velocity, Foreign research, Alinements, Finishing, Fluid mechanics, Mexico.
Identifiers: Cavitation control, *Cavitation index, *Recommendations, High velocity, Infiernillo Dam (Mex).

Erosion from cavitation in a high-velocity conduit such as a spillway tunnel is the primary factor to consider in construction; proper alinement and finishing are important. In addition, studying the possible use of aerating devices is advisable. A formula using roughness, pressure head, vaporization head, and bottom velocity is given for computing the coefficient of cavitation. An analysis of the spillway tunnels of the El Infiernillo Dam, Mexico, shows that the coefficient of cavitation decreases as the water velocity increases. When a bend is reached, the cavitation index increases because of an increase in pressure on the floor. The minimum value is found at the end of the bend; below the bend the cavitation index increases slowly because of a reduction in velocity close to the tunnel wall. The situation is more critical on the sidewalls than on the bottom because the depth is negligible on the bottom, provided there are no disalinements or isolated obstacles. (USBR)

INTEGRATING-FLOAT MEASUREMENTS AT LOW VELOCITIES,
Missouri Univ., Columbia; and Tennessee Valley Authority, Norris.
Henry Liu, and Larry D. Martin.
Proceedings, American Society of Civil Engineers, Journal of the Hydraulics Division, Vol 96, No HY1, p 143-151, Jan 1970. 9 p, 1 fig, 1 tab, 7 ref, 2 append.

Descriptors: Hydraulics, Hydrology, *Open channel flow, *Floats, Flow, *Flow measurement, Instrumentation, *Stream gages, Streamflow, Fluid flow, Velocity, Laboratory tests, *Discharge measurement, Discharge (Water).
Identifiers: *Integrating-float method.

Accurate flow measurement by the integration-float method is possible if the method is used properly. Flow measurement by this method was tested in a rectangular flume 1 ft wide and 2 ft deep. Stainless steel hollow spheres, 5/8-in. dia were used as floats. Accuracy of the technique was evaluated by comparing discharges measured with floats to those measured with standard weirs. Despite the influence of flow nonuniformity on some measurements, the average error was only 2.4% for the range of velocities studied (0.02 fps to 0.3 fps); this error is much less than can be expected from conventional current meters at such low velocities. Because no apparent decrease in accuracy was observed for the lower range of velocities studied, the same accuracy can be expected at flows of even smaller velocities. The potential usefulness of the technique for streamflow measurement at low velocities should not be overlooked. (USBR)

ESTUARY ENTRANCE UMPQUA RIVER, OREGON--HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
G. M. Fisackerly.
Report available from NTIS, Springfield, Virginia. Corps of Engineers, Waterways Experiment Station Technical Report H-70-6, May 1970. 20 p, 2 fig, 177 plate, 83 photo, 3 tab.

Descriptors: *Hydraulic models, *Oregon, *Estuaries, *Channels, Navigation, River training, Erosion control, Sedimentation, Channel improvement, Inlets (Waterways), Jetties, Coastal structures, Harbors, Shore protection.
Identifiers: Umpqua River (Ore).

The Umpqua River estuary model of the fixed-bed type, was constructed to scales of 1:300 horizontally and 1:100 vertically, to reproduce the lower 28 miles of the Umpqua River, Oregon and an adjoining portion of the Pacific Ocean. The model was equipped for accurate reproduction and measurement of tides, tidal currents, waves, salinity intrusion, freshwater inflow, shoaling distribution, and other significant prototype phenomena. The purpose of the model study was to determine the optimum plan for the reduction of shoaling and elimination of cross-currents in the navigation channel at the entrance. The model hydraulic and salinity regimens were in satisfactory agreement with those of the prototype for comparable conditions; therefore the model provided quantitative answers concerning the effects of the proposed plans on the hydraulic and salinity regimens of the estuary. The optimum plan consisted of existing conditions plus a 2600-ft extension of the training jetty to the outer end of the south jetty. Results of model tests indicate that the optimum plan can eliminate cross-currents without aggravating the wave climate or shoaling conditions. (Knapp-USGS)

HYDRAULICS OF BRIDGE WATERWAYS.
Bureau of Public Roads, Washington, D.C. Bridge Div.

For sale by Superintendent of Documents, US Government Printing Office, Washington, D.C. 20402--Price $1.25. Bureau of Public Roads

Hydraulic Design Series No 1, Federal Highway Administration, 2d edition 1970. Bradley, Joseph N., Consultant. 111 p, 55 fig, 11 tab, 43 ref, 3 append.

Descriptors: *Stage-discharge relations, *Backwater, *Flow profiles, *Bridges, Abutments, Hydraulics, Streamflow, Discharge (Water), Water levels, Water level fluctuations.
Identifiers: Backwater computation (Bridges).

Design charts and methods are presented for a wide variety of bridge backwater problems. The method of computing backwater as presented is intended to be used for relatively straight reaches of streams having subcritical flow and approximately uniform slope. The design information applies specifically to the normal stage-discharge condition. The method described permits a direct solution for backwater but requires a trial solution for discharge. (Knapp-USGS)

MODEL SIMILARITY CONCERNING THE TRANSPORT OF SUSPENDED MATTER IN A TURBULENT FLOW FIELD,
Technical Univ. of Istanbul (Turkey). Dept. of Hydraulics and Water Power.
Mutlu Sumer.
Also published in French. Journal of Hydraulic Research, Vol 8, No 3, p 357-364, 1970. 8 p, 1 fig, 6 ref.

Descriptors: *Hydraulic models, *Hydraulic similitude, *Sediment transport, Model studies, Hydraulics, Settling basins, Settling velocity, Sedimentation rates, Particle shape, Particle size, Turbulent flow, Suspended load.
Identifiers: Model similarity.

Model similarity in studies of the transport of suspended matter in a turbulent flow field is investigated and the most general conditions that establish the equivalence between prototype and model are obtained. The results are applied to settling basins. Models may be constructed without distortion in order to give equivalence between prototype and model. (Knapp-USGS)

HYDRAULIC JUMP WITHIN A GRADUALLY EXPANDING CHANNEL,
Asian Inst. of Tech., Bangkok (Thailand).
Alejandro U. Abella.
M.Eng. Thesis No 276, Asian Institute of Technology, 1970. 62 p, 16 fig, 6 tab, 20 ref.

Descriptors: *Hydraulic jump, *Open channel flow, *Energy dissipation, Stilling basins, Energy losses, Mathematical models, Hydraulic models, Alluvial channels, Stream erosion, Scour, Turbulent flow, Transition flow, Critical flow, Supercritical flow.
Identifiers: Circular hydraulic jump, Expanding flow.

Hydraulic jump occurring was studied in the transition of a gradually expanding channel. This expanding channel jump is considered to behave as a section of a circular jump. Equations describing the characteristics of the expanding channel jump are derived from the three basic principles of fluid flow. Observations were conducted using six different angles of divergence. The experimental results showed a close agreement with the theoretical solutions. The general equation developed for the jump, with proper evaluation of the side pressure force effect, describes well the phenomenon regardless of the angle of divergence. Expanding channel jump is relatively better than the jump in a rectangular channel for energy dissipation. An empirical expression for approximating the location of the jump within the transition was also developed. (Knapp-USGS)
W71-00383

EFFECT OF RAINFALL ON THE VELOCITY DISTRIBUTION AND TRACTIVE FORCE IN A TRIANGULAR OPEN CHANNEL,
Mississippi State Univ., State College. Dept. of Agricultural and Biological Engineering; and Auburn Univ., Ala. Dept. of Agricultural Engineering.
E. Dale Threadgill, and Ronald E. Hermanson.
American Society of Agricultural Engineers Transactions, Vol 12, No 3, p 352-355, May-June, 1969. 4 p, 2 fig, 3 tab, 13 ref.

Descriptors: *Rainfall-runoff relationships, *Open channel flow, *Hydraulic models, Rainfall, Distribution, *Velocity, *Tractive forces, Model studies, Regression analysis, Temperature.
Identifiers: *Triangular open channel, Sensors.

The effect of rainfall on the velocity distribution and tractive forces in a shallow, triangular channel was determined in a research flume equipped with a rainfall simulator. All tests were conducted at each of three depths of flow, 2, 4, and 6 inches, measured at the centerline of the flume. Vertical velocity profiles were obtained at each of the flush-mounted sensors and at the centerline of the flume by taking point velocity readings with the cylindrical hot-film sensors. Readings of the point velocities and tractive forces were taken at each flow depth without rainfall and with each of the three rainfall intensities. All tests were made for flow over both the rough and the smooth boundary. The sensors were recalibrated if the temperature of the water or the cold resistance of the sensor changed. In general, rainfall did not have a significant effect on the velocity gradients for any rainfall intensity or flow depth. Analyses of the data are tabulated. (Woodard-USGS)
W71-00405

ENERGY DISSIPATION IN OPEN CHANNELS BY LARGE SEMI-CIRCULAR DISK ROUGHNESS ELEMENTS,
Asian Inst. of Tech., Bangkok (Thailand).
Eer-ruenn Charng.
M. Eng. Thesis No 232, Asian Institute of Technology, 1969. 66 p, 8 fig, 6 tab, 22 ref, append.

Descriptors: *Open channel flow, *Roughness (Hydraulic), *Hydraulic gradient, *Energy losses, Turbulent flow, Head loss, Flow resistance, Fluid friction, Flumes, Hydraulic models, Air entrainment, Manning equation, Froude number.
Identifiers: Steep channels.

Flume tests were conducted using semi-circular disks as roughness elements in steep channels. The disks were made of aluminum sheets. The relative depths investigated ranged from approximately 1 to 6. From the experimental results, no meaningful relationships could be found between the flow resistance, the relative depth and geometric parameters describing the channel shape. This indicated that other variables such as air entrainment and the Froude number of the flow, which were originally not considered to be significant, were important in describing the flow phenomenon. (Knapp-USGS)

DELAWARE RIVER MODEL STUDY, REPORT NO 1. HYDRAULIC AND SALINITY VERIFICATION.
Army Engineer Waterways Experiment Station, Vicksburg, Miss.

Available from NTIS as AD-70 9741, $3.00 in paper copy, $0.95 in microfiche. Technical Memorandum No. 2-337, May 1956. 113 p.
Identifiers: *Delaware Bay, Hydraulic models, *Estuaries, Salinity, Inland waterways, Tides, River currents, Water pollution, Wastes (Industrial), Wastes (Sanitary engineering), Drainage, Dams, Construction, Pennsylvania, Delaware, New Jersey, Rivers, *Delaware River, *Salinity intrusion, *Channel improvements, Salinity distribution, Fresh water discharge, Graphs (Charts).

The Delaware River model reproduces the entire estuarine portion of Delaware Bay and River from the Capes to Trenton, N.J. The model is of fixed-bed construction and is equipped with all necessary appurtenances for accurate reproduction and measurement of tides, tidal currents, salinity intrusion, channel shoaling, and other significant phenomena of the prototype. The principal problems to be studied on the model are concerned with reduction of shoaling and salinity intrusion, although other problems of a lesser degree of importance will also be investigated. This report is concerned with the hydraulic and salinity verification of the model, and contains complete data showing the degree of accuracy attained with respect to duplication in the model of observed portotype phenomena.
W71-00443

AN EXPERIMENTAL STUDY OF TURBULENT DIFFUSION OF DRAG-REDUCING POLYMER ADDITIVES,
LTV Research Center, Dallas, Tex.
R. R. Walter, and C. S. Wells.
Available from NTIS as AD-709 455, $3.00 in paper copy, $0.95 in microfiche. April 1970. 38 p. ONR 062-422.
Identifiers: *Diffusion, *Additives, *Drag, Reduction, *Polymers, Skin friction, Turbulence, Injection, Pipes, Fluid flow, Thickness, Concentration (Chemistry), *Drag reducing fluids, Pipe flow.

An experimental study of the mechanics of turbulent diffusion when uniformly injecting a drag-reducing polymer solution through a wall adjacent to a fully developed pipe flow of water is described. Experimental diffusion data were obtained using very low injection rates in a porous wall pipe tos section designed on the basis of a prior theoretical diffusion analysis with uniform injection. The drag-reducing effectiveness of the polymer only in the wall region, discovered previously, is substantiated by detailed concentration profile, velocity profile and wall shear stress data. These data indicate that an increase in the viscous sublayer thickness is accompanied by an increase in the diffusion sublayer thickness for uniform drag-reducing polymer injection. Also, uniform polymer injection at the wall appeared to somewhat inhibit the turbulent diffusion away from the wall. This type of injection provided drag reduction with a much smaller supply of polymer than required to raise the concentration throughout the shear layer to the same drag-reducing level.
W71-00469

MICROSCOPIC OPEN CHANNEL BOUNDARY LAYER VELOCITY MEASUREMENT USING A VERTUAL IMAGE METHOD,
Illinois Univ., Urbana. Water Resources Center.
Harry G. Wenzel, and Kuo C. Chang.
Available from NTIS as PB-195 163, $3.00 in paper copy, $0.95 in microfiche. Illinois Water Resources Center Research Report 31, April 1970. 31 p, 1 tab, 11 fig, 12 ref. OWRR Project A-026-ILL (1).

Descriptors: *Boundary layers, *Microscopy, *Open channel flow, *Tracers, Tractive forces, Velocity, Flow.

dentifiers: *Velocity measurement, Virtual image nethod.

A method for velocity measurement is described vhich employs a microscope and high speed mo- ion picture camera to record the motion of small racer particles suspended in the flow. The rocedure, termed the image method, involves par- icle illumination such that the particle itself and its irtual image created by reflection from a bounda- y both appear on the film. The boundary is then ocated equidistant from the two images. The plane f focus is oriented normal to the boundary giving a icture of the entire velocity profile normal to the oundary within the limits of the field of view. A rame by frame analysis of the particle motion can ield velocity profile and turbulence information. The image method was adapted to a small open hannel. Considerable difficulty was encountered n illuminating the particles with sufficient intensity o impress their image on the film. Thus, quantita- ive data was not obtained. It was concluded that he lens system used to focus the light source was nadequate. However, the method has potential ap- lications in velocity measurement near a bounda- y and flow visualization studies.

LOAD TRANSFER IN EARTH AND ROCKFILL DAMS,
Shannon and Wilson, Inc., Portland, Oreg.
L. Radley Squier.
Proceedings American Society of Civil Engineers, Soil Mechanics Foundation Division, Vol 96, No SM1, p 213-233, Jan 1970. 21 p, 20 fig, 4 tab, 23 ref, append.

Descriptors: Dams, *Earth dams, *Rockfill dams, nstrumentation, Loads (Forces), *Load distribu- ion, Stress concentration, Stress distribution, *Dif- erential settlement, Structural behavior, Soil nechanics, Cracking, Earth pressure, Compressi- ility, Differential displacements, Settlement Structural), Strain, Pore pressure, Stress, Bibliographies.
dentifiers: Stress reversal, Arching, Netzahual- coyotl Dam, Mexico, El Infiernillo Dam, Mexico, Arch action, Embankment subsidence.

nstrumentation data obtained from several major ockfill dams revealed that various modes of load ransfer and changes in modes may occur in an em- bankment. Load transfer may influence signifi- cantly the characteristics of embankment behavior, ettlements and cross-valley displacements, strains, pore-water pressures, and earth pressures. Effects of load transfer on embankment behavior are a unction of the stiffness of the core materials in conjunction with the settlement characteristics of he shell materials. Occurrence and effects of load ransfer in Mexico's El Infiernillo and Netzahual- coyotl Dams are described. The instrumentation used in the study consisted of inclinometers and crossarms installed during construction of the em- bankments. Settlement data were expressed in erms of strains or in terms of a percentage of the surface increment of settlement. Changes in strain at depth within certain intervals of time reflected changes in stress. A need exists for greater use of nstrumentation of the type which, during construc- ion and post-construction periods, reflects the mass behavior of the various zones comprising the dam. (USBR)

INFLUENCE OF GRAIN ORIENTATION ON DIRECT SHEAR STRENGTH OF A LOESSIAL SOIL,
Rudolph V. Matalucci, Mohamed Abdel-Hady, and John W. Shelton.
Engineering Geology, Vol 4, No 2, p 121-132, Apr 1970. 12 p, 10 fig, 2 tab, 12 ref.

Descriptors: Soil engineering, Soil mechanics, Soil properties, *Shear strength, Soil strength, *Soil structure, Soil tests, Shear tests, Shear planes, Direct shear, Anisotropy, *Loess, Undisturbed samples, Effects.
Identifiers: Failure surfaces.

Direct shear tests were used to evaluate strength anisotropics of undisturbed specimens of Vicksburg loess caused by particle imbrication and azimuthal preferred grain orientation. Average peak shear strength of dry specimens sheared parallel to imbrication was 9% lower than those sheared perpendicular to imbrication. Average peak strength of dry specimens sheared parallel to preferred grain orientation was 12% lower than those sheared perpendicular to grain orientation. For moist specimens the same trend was maintained, but the degree of strength variation was considerably smaller. Failure planes parallel to grain orientation produced off-lapping, short, discontinuous fractures; failure planes normal to grain orientation produced uniform, continuous fractures. Azimuthal preferred grain orientation and particle imbrication were determined from measurements on photomicrographs and by using a dielectric anisotropy instrument. (USBR)

ROCK PROPERTIES AND STEEL TUNNEL LINERS,
California State Dept. of Water Resources, Sacramento.
George H. Kruse.
Proceedings, American Society of Civil Engineers, Journal of the Power Division, Vol 96, No P03, p 415-435, June 1970. 21 p, 11 fig, 2 tab, 16 ref, 2 append.

Descriptors: *Steel linings, *Tunnel design, *Tunnel linings, Tunnels, Pressure tunnels, Bibliographies, Liner plates, *Rock properties, Rocks, Water tunnels (Conveyance), Rock mechanics, Design, Stress distribution, Design criteria, Stress analysis, Classification, Deformation, Strain, Relaxation.
Identifiers: Tehachapi Discharge Lines (Calif), Design improvements, Rock pressures, In situ tests, Deformation modulus, Tunnel supports.

The economical design of steel liners for underground pressure tunnels in rock is dependent upon the determination of the properties of the rock envelope and its state of stress. For maximum economy, liner plate thickness is held to a minimum by relying on the load-bearing response of the rock to resist part of the internal hydrostatic pressure while restraining the steel liner at a safe level of strain. A method is presented for evaluating the load-bearing response of the rock around the tunnel, based upon measurement of tunnel convergence (relaxation) during excavation. A system is described for classifying rock along the tunnel and providing appropriate adjustments of linear thickness and reinforcement. A design analysis based on a criterion of steel strain is presented. (USBR)

INSTALLATION, PRESSURIZATION, AND GROUTING OF HYDRAULIC FLAT JACKS IN MORROW POINT POWERPLANT,
Bureau of Reclamation, Denver, Colo.
M. L. Haverland.
Bureau of Reclamation Report REC-OCE-70-19, June 1970. 48 p, 36 fig, 13 tab.

Descriptors: *Underground powerplants, Underground structures, *Rock mechanics, Rocks, Installation, Pressure, Grouting, Calibrations, *Earth movements, Testing, Movement, Piping (Mechanical), Instrumentation, Measurement, *Stabilization.
Identifiers: *Flat jack method, *Jacking, Morrow Point Powerplantcolo), Rock pressures, Underground openings.

Hydraulic flat jacks were installed at strategic locations in the underground excavation for Morrow Point Powerplant, Colo, to provide a reaction against moving rock in a shear zone. Structural behavior monitoring instruments indicated that one rock wall of the underground chamber, located in a shear zone, was slowly moving toward the river. Because construction of the concrete powerplant structure was scheduled for the near future, installing and pressurizing the flat jacks would fill the void caused by concrete shrinkage and provide a known amount of post-stress load. The interior walls and floors would act as load-bearing struts across the powerplant. Twenty flat jacks 96-in. by 16-in. were installed, tested and calibrated, instrumented, pressurized, and grouted. Rock movement stopped while this program was being accomplished, but other remedial measures were in progress at the same time. Which measures had the most effect or whether all worked together to stop the movement cannot be determined. Descriptions of the flat jack installation are included. (USBR)

CONCRETE BECKONS POLYMERS.

Chemical Engineering, Vol 77, No 5, p 70-72, Mar 1970. 2 p.

Descriptors: *Concrete technology, *Polymers, *Strength, *Durability, Epoxy resins, Styrenes, Concrete pipes, Impregnation, *Irradiation, Heat, Catalysts, Construction materials, Road construction, Adhesion, *Monomers, Tunnel linings, Costs, Research and development.
Identifiers: *Concrete-polymer materials, *Polymer concretes, Rupture modulus, Polymerization, Bond strength, Brookhaven National Lab.

When polymers are combined with concrete, the resulting composite offers high strength and durability. Polymer addition might even made structural materials of soil or garbage and sewage. The polymer contributes to such properties as strength, durability, and water resistance. A broad range of polymers and monomers are being studied, including methyl methacrylate, polyesters, styrene, epoxies, and nylon. Projects involving concrete are aimed mainly at improving strength. Steel-reinforced concrete panels treated with methyl methacrylate and polymerized increases the modulus of rupture 2-1/2 times. Similarly, pullout strength is increased by a factor of 3 for concrete reinforced with steel bars. Surface impregnation of concrete increases durability. Soil-polymers for building materials and polymers in tunnel walls are discussed. (USBR)

FIELD AND LABORATORY TESTS FOR SAFETY OF DAMS INVESTIGATION AT SALT RIVER PROJECT, ARIZONA,
Bureau of Reclamation, Denver, Colo. Office of Chief Engineer.
W. G. Austin.
Available from NTIS as PB-191 775, $3.00 in paper copy, $0.95 in microfiche. REC-OCE-70-7, February 1970. 68 p.
Identifiers: *Dams, Safety, *Arizona, Dams, Test methods, Reinforced concrete, Stresses, Loading (Mechanics), Deformation, Construction materials, Drilling, Strain (Mechanics), Rivers, Drilling machines, Salt River Project, Coring.

Survey records indicated that Stewart Mountain and Horse Mesa Dams, San River Project, Ariz., had nonrecoverable displacements exceeding the elastic capability of concrete in order to assess the safety of these dams, the magnitudes of the internal stresses in the concrete under near maximum loading conditions were required. The internal strains were measured in situ by stress relief methods using a borehole deformation gage. A similar program also was conducted on Mormon Flat Dam. Several laboratory tests were performed on the 6-in. extracted cores to obtain physical properties. Laboratory preparations for the field tests, field stress relief tests, and laboratory core tests conducted for the Safety of Dams Program for the Salt River Project are reported.

IDEAS FOR PEACEFUL NUCLEAR EXPLOSIONS IN USSR.

International Atomic Energy Agency Bulletin, Vol 12, No 2, p 11-21, 1970. 11 p, 2 fig.

Descriptors: *Nuclear explosions, *Underground explosions, Mining, Underground storage, *Canal construction, *Reservoir construction, Field tests, Safety, Research and development, Foreign research, Seismic properties, Radiation effects, Radioactive contamination, Inter-basin transfers, *Investigations, Construction, Costs, Permafrost.
Identifiers: *Nuclear excavation, USSR, Underground cavities, Gas production, Explosive excavation.

Possible applications of peaceful nuclear explosions in the Soviet economy are reviewed. Scientific research figures prominently in plans for future industrial application of nuclear explosions. Contained blasts and excavation blasts have been investigated. Much work has been done to define fields of application and projects in which nuclear explosions can be used for industrial purposes. Excavation blasts discussed include: reservoir construction, canal construction, and uncovering mineral deposits. Contained blasts discussed include: intensified exploitation of oil and gas deposits; experimental explosions in salt formations; creation of underground cavities for storing natural gas, gas condensates, and oil products; and underground working of ore deposits. Identifiers: Mekong River Basin.

The Selected Bibliography-Lower Mekong Basin of over 3,000 references was prepared as a companion reference work for use with the Atlas of Physical, Economic and Social Resources of the Lower Mekong Basin which was published in September 1968. It is also offered as a research tool that may be used independently of the atlas. The 2 volumes were designed to accommodate change for long-range usefulness of their contents. The loose-leaf style provides the potential for a program of subject category expansion. In main the entries represent material available in the Washington, D. C. area. The file location of each item and additional information not included in the printed bibliography are available at the Engineer Agency for Resources Inventories (United Nations). Within each subject the entries are listed alphabetically by author with single authors preceding joint

or multiple authors, and with title used as main entry when there is no author. Titles by the same author are arranged alphabetically. Some compilations are entered under an editor or title if there are several authors. Entries are given in the language of the original with the exception of those in non-Roman alphabets which are translated or transliterated. (Knapp-USGS)

MRIS BULLETIN-DEVELOPMENT ISSUE.
National Academy of Sciences-National Research Council, Washington, D.C. Maritime Research Information Service.

National Academy Science, Maritime Research Information Service Bulletin, Summer 1970. 226 p. Maritime Administration Contract MA-4776.

Descriptors: *Bibliographies, *Abstracts, *Information retrieval, *Oceanography, Marine geology, Navigation, Water pollution control, Ships, Computers, Research and development, Transportation.

The Maritime Research Information Service (MRIS) is a system for acquisition, selection, storage, retrieval, and dissemination of references to proposed, ongoing, and completed research and development projects and to technical reports and journal articles in the maritime field. MRIS incorporates concepts and procedures that are compatible with data standards recommended by the Committee on Scientific and Technical Information (COSATI). The MRIS Bulletin is compiled and published from the computer tape records of the Maritime Research Information Service (MRIS). Each issue will contain only that information acquired since the previous issue, and an annual consolidated bulletin will be compiled containing all selections for the preceding year. Selections for this publication are made by the MRIS professional staff and include unclassified-unlimited contributions from the Maritime Administration, U. S. Department of Commerce; Science Information Exchange (SIE); Engineering Index (EI); National Technical Information Service (NTIS); Department of Defense (DOD); National Aeronautics and Space Administration (NASA); Atomic Energy Commission (AEC); Transportation Research Information Service of the National Academy of Sciences (TRIS); and Joint Publications Research Service (JPRS). Three indexes are provided, as follows: (1) Subject Term Index; (2) Author/Investigator Index; and (3) Publisher/Performing Organization Index. (Knapp-USGS)

GROWTH RATE
EFFECT OF NITROLOTIRACETIC ACID ON THE GROWTH AND METABOLISM OF ESTUARINE PHYTOPLANKTON,
W71-00132 05D

GULLY EROSION
CHANNEL-SCARP FORMATION IN WESTERN NORTH DAKOTA,
W71-00185 04D

HABITAT IMPORVEMENT
RANGE AND WILDLIFE HABITAT EVALUATION--A RESEARCH SYMPOSIUM,
W71-00209 06G

HABITATS
ATTRACTION OF COPROPHAGOUS BEETLES TO FECES OF VARIOUS ANIMALS,
W71-00340 05B

HARBORS
DISPOSAL OF RADIOACTIVE WASTES FROM U. S. NAVAL NUCLEAR-POWERED SHIPS AND THEIR SUPPORT FACILITIES, 1969,
W71-00030 05E

OPPORTUNITIES FOR DEVELOPMENT OF RIVER PORTS ON THE ARKANSAS RIVER WATERWAY SYSTEM SALLISAW, OKLAHOMA.
W71-00456 03E

OPPORTUNITIES FOR DEVELOPMENT OF RIVER PORTS ON THE ARKANSAS RIVER WATERWAY SYSTEM, DESHA COUNTY, ARKANSAS.
W71-00457 03E

OPPORTUNITIES FOR DEVELOPMENT OF RIVER PORTS ON THE ARKANSAS RIVER WATERWAY SYSTEM, VAN BUREN, ARKANSAS.
W71-00458 03E

TECHNIQUES FOR FORECASTING LOW WATER OCCURENCES AT BALTIMORE AND NORFOLK,
W71-00467 02B

IRIS V TOWN OF HINGHAM (DIVISION OF PLATS ADJACENT TO RIPARIAN LAND).
W71-00510 06E

HARVESTING OF ALGAE
SURFACE PROPERTIES AND ION EXCHANGE IN ALGAE REMOVAL,
W71-00138 05D

HAWAII
FLOOD HYDROLOGY OF SMALL WATERSHEDS EVALUATION OF TIME PARAMETERS AND DETERMINATION OF PEAK DISCHARGE,
W71-00403 02E

HEATED WATER
TEMPERATURE AND ROOTED AQUATIC PLANTS,
W71-00254 05C

HEAVY METALS
DETERMINATION OF SUBMICROGRAM QUANTITIES OF MERCURY IN LAKE WATERS,
W71-00355 05A

HERBICIDES
EFFECT OF SOIL WATER STRESS AND SOIL TEMPERATURE ON TRANSLOCATION OF DIURON,
W71-00226 02I

AN ANNUAL REPORT OF THE CHEMICAL CONTROL OF ALLIGATORWEED,
W71-00396 04A

HERBS
WATER-REPELLENT SOILS IN SOUTHERN CALIFORNIA,
W71-00155 02G

HETEROTROPHIC POPULATIONS
THE IRRELATION OF CARBON AND PHOSPHORUS IN REGULATING HETEROTROPHIC AND AUTOTROPHIC POPULATIONS IN AQUATIC ECOSYSTEMS,
W71-00475 05C

HIGHWAY ICING
KANARKOWSKI V BOROUGH OF NORTH BRADDOCK (DUTY OF CITY TO PROPERLY DRAIN STREETS).
W71-00399 06E

STRAUCH V CITY OF SCRANTON (DUTY OF MUNICIPALITIES TO PROVIDE DRAINAGE FOR SURFACE WATERS).
W71-00401 06E

HOG CONFINEMENT
OXIDATION DITCHES CAN ELIMINATE ODORS, MANURE HANDLING AND POLLUTION,
W71-00343 05D

HOGS
GASES AND ODORS FROM STORED SWINE WASTES,
W71-00326 05B

EFFECT OF STRESS ON SWINE HEAT AND COLD EXPOSURE AND STARVATION ON VANILMANDELIC ACID OUTPUT IN THE URINE,
W71-00335 05B

OXIDATION DITCHES CAN ELIMINATE ODORS, MANURE HANDLING AND POLLUTION,
W71-00343 05D

HORIZONTAL WELLS
MODEL TESTS FOR A HORIZONTAL WELL,
W71-00198 02F

HOUSTON
WATER FOR HOUSTON,
W71-00315 06D

HOUSTON(TEXAS)
URBAN HYDROLOGY OF THE HOUSTON, TEXAS METROPOLITAN AREA, COMPILATION OF BASIC DATA, 1967,

HUMIC ACIDS
NATURAL ORGANIC ACIDS AS AGENTS OF CHEMICAL WEATHERING,
W71-00174 02K

HUMIC SUBSTANCES FULVIC ACID-DIALKYL PHTHALATE COMPLEXES AND THEIR ROLE IN POLLUTION,
W71-00377 05B

HURRICANES
JOINT PROBABILITY METHOD OF TIDE FREQUENCY ANALYSIS APPLIED TO ATLANTIC CITY AND LONG BEACH ISLAND, N. J.,
W71-00378 04A

EFFECTS OF HURRICANES CAMILLE AND LAURIE ON THE BARATARIA BAY ESTUARY,
W71-00379 02L

BEACH CHANGES BY EXTRAORDINARY WAVES CAUSED BY HURRICANE CAMILLE,
W71-00380 02J

EFFECTS OF HURRICANE CAMILLE ON THE LANDSCAPE OF THE BRETON-CHANDELEUR ISLAND CHAIN AND THE EASTERN PORTION OF THE LOWER MISSISSIPPI DELTA,
W71-00381 02J

METEOROLOGICAL ASPECTS OF HURRICANE CAMILLE--AUGUST 14-22, 1969,
W71-00382 02B

HYDRAULIC GRADIENT
ENERGY DISSIPATION IN OPEN CHANNELS BY LARGE SEMI-CIRCULAR DISK ROUGHNESS ELEMENTS,
W71-00406 08B

HYDRAULIC JUMP
HYDRAULIC JUMP WITHIN A GRADUALLY EXPANDING CHANNEL,
W71-00383 08B

HYDRAULIC MODELS
MODEL TESTS FOR A HORIZONTAL WELL,
W71-00198 02F

ESTUARY ENTRANCE UMPQUA RIVER, OREGON--HYDRAULIC MODEL INVESTIGATION,
W71-00308 08B

MODEL SIMILARITY CONCERNING THE TRANSPORT OF SUSPENDED MATTER IN A TURBULENT FLOW FIELD,
W71-00358 08B

AUTOMATIC DEVICE FOR PLOTTING PROFILES OF HYDRAULIC MODELS,
W71-00360 07C

EFFECT OF RAINFALL ON THE VELOCITY DISTRIBUTION AND TRACTIVE FORCE IN A TRIANGULAR OPEN CHANNEL,
W71-00405 08B

HYDRAULIC SIMILITUDE
MODEL SIMILARITY CONCERNING THE TRANSPORT OF SUSPENDED MATTER IN A TURBULENT FLOW FIELD,
W71-00358 08B

HYDRAULIC STRUCTURES
ICE PRESSURE ON ENGINEERING STRUCTURES,
W71-00012 02C

HYDRAULICS
TRANSLATIONS OF FOREIGN LITERATURE ON HYDRAULICS.
W71-00015 10

HYDRAULIC GEOMETRY OF 12 SELECTED STREAM SYSTEMS OF THE UNITED STATES,
W71-00472 02E

HYDRO DYNAMICS
WAVE-HEIGHT PREDICTION FOR WAVE GENERATORS IN SHALLOW WATER,
W71-00143 08B

HYDROELECTRIC PLANTS
WARREN V GEORGIA POWER CO (LIABILITY FOR FLOOD DAMAGE CAUSED BY BACKWATER FROM DAM).
W71-00086 06E

HYDROELECTRIC POWER
NIAGARA FALLS POWER CO V MALTBIE (CONTROL OF HYDROELECTRIC POWER RATES).
W71-00501 06E

HYDROGEOLOGY
COMPARATIVE HYDROGEOLOGY AN EXAMPLE OF ITS USE,
W71-00029 02A

REGIONAL GROUNDWATER FLOW BETWEEN LAKE SIMCOE AND LAKE ONTARIO,
W71-00031 02F

GROUNDWATER RESOURCES OF THE LOWER HILLSBORO CANAL AREA, SOUTHEASTERN FLORIDA,

PRODUCTION FUNCTION
IDENTIFICATION AND SPECIFICATION ANALYSIS OF ALTERNATIVE EQUATIONS FOR ESTIMATING THE ELASTICITY OF SUBSTITUTION,
W71-00291 06B

PRODUCTIVITY
GEOBOTANIC APPROACH FOR IMPROVEMENT OF RANGE RESOURCES IN DESERT AND SEMI-DESERT AREAS OF KAZAKHSTAN, USSR,
W71-00146 03B

PROFILES
WATER-SURFACE ELEVATIONS AND CHANNEL CHARACTERISTICS FOR A SELECTED REACH OF THE APPLEGATE RIVER, JACKSON COUNTY, OREGON,
W71-00353 02E

AUTOMATIC DEVICE FOR PLOTTING PROFILES OF HYDRAULIC MODELS,
W71-00360 07C

PROFITS
IDENTIFICATION AND SPECIFICATION ANALYSIS OF ALTERNATIVE EQUATIONS FOR ESTIMATING THE ELASTICITY OF SUBSTITUTION,
W71-00291 06B

PROGRAMMING
THE SYMMETRIC FORMULATION OF THE SIMPLEX METHOD FOR QUADRATIC PROGRAMMING,
W71-00298 06A

PROGRAMS
TOWARD AN EFFECTIVE AND CREDIBLE PROGRAM WATER POLLUTION CONTROL,
W71-00311 06E

PROJECT PLANNING
A PROPOSED STREAMFLOW DATA PROGRAM FOR MICHIGAN,
W71-00199 02E

PROVENANCE
SOURCE AND DISPERSION OF SURFACE SEDIMENTS IN THE GULF OF MAINE--GEORGES BANK AREA,
W71-00387 02J

PUBLIC AWARENESS
LAND AND WATER RESOURCES MANAGEMENT FOR ENVIRONMENTAL IMPROVEMENT,
W71-00320 06B

PUBLIC BENEFITS
CITY OF CORAL GABLES V CRANDON (ESTABLISHMENT OF WATER CONSERVATION DISTRICT).
W71-00062 06E

PUBLIC GOODS
THE ECONOMICS OF CONGESTION AND POLLUTION AN INTEGRATED VIEW,
W71-00294 06B

PUBLIC HEALTH
WATER AND HEALTH--ARE WE CONCERNED ENOUGH,
W71-00312 05F

WHEELER V RIVER FALLS POWER CO (LIABILITY OF POWER COMPANY FOR VIOLATION OF BOARD OF HEALTH'S REGULATIONS).
W71-00535 06E

PUBLIC INVESTMENT
PUBLIC INVESTMENT AND PLANNING A RESPONSE,
W71-00310 06B

PUBLIC POLICY
TOWARD AN EFFECTIVE AND CREDIBLE PROGRAM WATER POLLUTION CONTROL,
W71-00311 06E

PUBLIC RIGHTS
STATE V STOUTAMIRE (RIGHT OF PEOPLE TO TAKE FISH FROM PUBLIC WATERS OF THE STATE).
W71-00082 06E

KUEHN V VILLAGE OF WAHTOMEDI (CONFLICT BETWEEN PUBLIC AND PRIVATE OPERATORS OF WATER SYSTEMS).
W71-00094 06E

PUBLIC UTILITIES
CITY OF MILWAUKEE V PUBLIC SERVICE COMM'N (PUBLIC UTILITIES REGULATION).
W71-00098 06E

ESTIMATED WATER USE IN FLORIDA, 1965,
W71-00376 06D

STANDARD UTILITY LOCATIONS FOR THE CITY OF PHOENIX.
W71-00484 08A

NORTHERN STATES POWER CO V FEDERAL POWER COMM'N (REGULATORY POWER OF THE FEDERAL POWER COMMISSION).
W71-00489 06E

PUERTO RICO
WATER RESOURCES OF THE GUAYANILLA-YAUCO AREA, PUERTO RICO,
W71-00228 02E

PULP AND PAPER INDUSTRY
RHODES V INTERNATIONAL PAPER CO (LIABILITY FOR DAMAGES CAUSED FOR DISCHARGE OF INDUSTRIAL WASTES).
W71-00531 06E

PULP WASTES
RHODES V INTERNATIONAL PAPER CO (LIABILITY FOR DAMAGES CAUSED FOR DISCHARGE OF INDUSTRIAL WASTES).
W71-00531 06E

PUMPED STORAGE
DESIGN OF CARTERS PUMPED STORAGE PROJECT,
W71-00270 08A

PUMPING
A COMPUTER METHOD FOR PUMPING-TEST ANALYSIS,
W71-00197 02F

PUMPING PLANTS
BOARD OF LEVEE COMM'RS V MANGUM (RIGHT TO HAVE STREAM FLOW IN NATURAL COURSE MAY BE EXPRESSLY OR IMPLIEDLY WAIVED).
W71-00532 06E

PYRAMID LAKE(NEV)
RECONNAISSANCE BATHYMETRY OF PYRAMID LAKE, WASHOE COUNTY, NEVADA,
W71-00189 02H

QUADRATIC PROGRAMMING
THE SYMMETRIC FORMULATION OF THE SIMPLEX METHOD FOR QUADRATIC PROGRAMMING,
W71-00298 06A

QUANTITATIVE ANALYSIS
MANAGEMENT EVOLUTION IN THE QUANTITATIVE WORLD,
W71-00286 06B

RADIOACTIVE WASTE DISPOSAL
DISPOSAL OF RADIOACTIVE WASTES FROM U. S. NAVAL NUCLEAR-POWERED SHIPS AND THEIR SUPPORT FACILITIES, 1969,
W71-00030 05E

DEEP-SEA DISPOSAL OF LIQUID AND SOLID WASTES,
W71-00349 05E

RADIOACTIVE WELL LOGGING
NOTES ON THE POSITION OF A PHOSPHATE ZONE AND ITS RELATION TO GROUNDWATER IN COASTAL GEORGIA,
W71-00178 02F

RADIOACTIVITY TECHNIQUES
RADIATION-INDUCED PREPARATION OF METALS FROM THEIR AQUEOUS SALT SOLUTIONS,
W71-00040 01B

RAINFALL
COMPILATION OF HYDROLOGIC DATA, ESCONDIDO CREEK, SAN ANTONIO RIVER BASIN, TEXAS, 1968.
W71-00013 02E

URBAN HYDROLOGY OF THE HOUSTON, TEXAS METROPOLITAN AREA, COMPILATION OF BASIC DATA, 1967,
W71-00046 02E

AGRICULTURAL EVOLUTION IN ISRAEL IN THE TWO DECADES SINCE INDEPENDENCE,
W71-00148 03F

A STATISTICAL ANALYSIS OF THE RAINFALL OVER THE SUDAN,
W71-00159 02B

COMPILATION OF HYDROLOGIC DATA, COW BAYOU, BRAZOS RIVER BASIN, TEXAS, 1968.
W71-00216 02E

RAINFALL-RUNOFF RELATIONSHIP
FLOOD PLAIN MODELING,
W71-00321 04A

RAINFALL-RUNOFF RELATIONSHIPS
WATERSHED RESEARCH IN WESTERN NORTH CAROLINA - A STUDY OF THE EFFECTS OF AGRICULTURAL COVERS UPON THE HYDROLOGY OF SMALL WATERSHEDS.
W71-00033 04A

RAINFALL-RUNOFF RELATIONS FOR SOUTHWESTERN LOUISIANA,
W71-00059 02A

PEAK FLOW AND CRITICAL DURATION FOR SMALL WATERSHEDS,
W71-00061 02E

EISENSTEIN V MAYOR, COUNSELOR AND ALDERMEN (CITY'S DRAINAGE SYSTEM MUST BE ADEQUATE TO ACCOMMODATE USUAL RAINFALL).
W71-00279 06E

FLOOD HYDROLOGY OF SMALL WATERSHEDS EVALUATION OF TIME PARAMETERS AND DETERMINATION OF PEAK DISCHARGE,
W71-00403 02E

EFFECT OF RAINFALL ON THE VELOCITY DISTRIBUTION AND TRACTIVE FORCE IN A TRIANGULAR OPEN CHANNEL,
W71-00405 08B

RAJASTHAN
WATER BUDGET IN THE ARID ZONE OF RAJASTHAN DURING 1941-1960,
W71-00153 02B

RAJASTHAN DESERT
GEOBOTANICAL STUDIES IN GEO-HYDROLOGICAL SURVEYS IN THE ARID ZONE OF W. RAJASTHAN,
W71-00145 02F

RANGE MANAGEMENT
RANGE AND WILDLIFE HABITAT EVALUATION--A RESEARCH SYMPOSIUM,
W71-00209 06G

RANGES
CONTRIBUTION OF RANGE LAND RUNOFF TO LAKE EUTROPHICATION,
W71-00118 02H

RATE OF DISCOUNT
RISK AND THE SOCIAL RATE OF DISCOUNT,
W71-00287 06B

RATE OF RETURN
ALTERNATIVE RATE OF RETURN CONCEPTS AND THEIR IMPLICATIONS FOR UTILITY REGULATION,
W71-00292 06B

REAERATION
USE OF CHANNEL SLOPE AND DISCHARGE TO DETERMINE REAERATION COEFFICIENTS FOR THE ELKHORN RIVER IN NEBRASKA,
W71-00176 05B

SANITARY BIOLOGICAL CONDITIONS, PROCESSES OF SELF-PURIFICATION AND CONTENT OF TRACE ELEMENTS IN THE WATERS OF THE RIVERS OF THE SHEKI-ZAKATALY ZONE OF AZERBAYDZHAN,
W71-00220 05B

REASONABLE USE
STURTEVANT V FORD (UPSTREAM OWNER LIMITED TO REASONABLE USE OF WATER).
W71-00513 06E

KYSER V NEW YORK CENT RR (RIPARIAN RIGHT TO MAKE REASONABLE USE OF RIVER'S WATERS).
W71-00518 06E

COOK V TOWN OF MEBANE (MUNICIPALITY'S LIABILITY FOR DIVERSION AND POLLUTION OF STREAM).
W71-00524 06E

RECESSION CURVES
A SEMIQUANTITATIVE METHOD FOR DETERMINING THE SOURCE OF SPRINGFLOW IN THE MISSOURI OZARKS,
W71-00181 02F

RECHARGE
EFFECTS OF A CONCENTRATED ACID ON WATER CHEMISTRY AND WATER USE IN A PLEISTOCENE OUTWASH AQUIFER,
W71-00194 05B

RECLAMATION ACT
SILAS MASON CO V TAX COMM'N OF WASHINGTON (STATE'S RIGHT TO TAX FEDERAL GOVERNMENT'S CONTRACTORS).
W71-00213 06E

RECOMMENDATIONS
CONSTRUCTION RECOMMENDATIONS, DESIGN CRITERIA AND THEIR APPLICATION,
W71-00264 08B

RECREATION
MCCAULEY V SALMON (RELATIVE RIGHTS OF RIPARIAN OWNERS AND THE PUBLIC ALONG NAVIGABLE WATERS).
W71-00109 06E

COMPETITIVE RECREATIONAL USES OF SELECTED IOWA LAKES,
W71-00230 06B

THE MEASUREMENT OF BENEFITS OF TROUT FISHING PRELIMINARY RESULTS OF A STUDY AT GRAFHAM WATER, GREAT OUSE WATER AUTHORITY, HUNTINGDONSHIRE,
W71-00275 06B

ACTIVITY SPECIALIZATION AMONG OHIO'S RECREATION BOATERS,
W71-00297 06B

RECREATION DEMAND
WATER QUALITY CRITERIA FOR SELECTED RECREATION USES,
W71-00471 06B

RECREATIONAL BENEFIT
TIME BIAS IN RECREATION BENEFIT ESTIMATES,
W71-00277 06B

RECREATIONAL DEMAND
TIME BIAS IN RECREATION BENEFIT ESTIMATES,
W71-00277 06B

RECREATIONAL USE PATTERNS
COMPETITIVE RECREATIONAL USES OF SELECTED IOWA LAKES,
W71-00230 06B

REGIONAL ANALYSIS
INTERPRETATION OF HYDROGEOLOGIC DATA FOR GROUNDWATER MANAGEMENT,
W71-00150 02F

ECONOMIC ASPECTS OF THE ENVIRONMENT,
W71-00276 06B

A NOTE ON REGIONAL INPUT-OUTPUT MODELS,
W71-00295 06A

COORDINATION IN ENVIRONMENTAL PLANNING,
W71-00301 06B

PRELIMINARY WASTE WATER REPORT FOR THE OUTER AREA.
W71-00485 05D

REGIONAL PLANNING
RICHMOND REGIONAL SEWERAGE PLAN AREA WIDE PLAN FOR LONG RANGE DEVELOPMENT.
W71-00445 05G

RICHMOND REGIONAL WATER PLAN. AREA WIDE PLAN FOR LONG RANGE DEVELOPMENT, TECHNICAL DATA.
W71-00446 05G

SURFACE STORM WATER RUNOFF AND DRAINAGE STUDY FOR ESSEX COUNTY, NEW JERSEY.
W71-00448 04A

REGIONAL PLANNING AND DEVELOPMENT
INVENTORY AND ANALYSIS OF EXISTING WATER SUPPLY SYSTEMS AND POTENTIAL SOURCES OF SUPPLY, VOLUME IV.
W71-00434 04A

WATER AND SEWERAGE STUDY, SECOND PHASE.

CIRCULATION, EFFLUENT DIFFUSION, AND SEDIMENT TRANSPORT, MOUTH OF SOUTH PASS, MISSISSIPPI RIVER DELTA,
W71-00036 05B

A METHOD OF ESTIMATING ANNUAL SUSPENDED-SEDIMENT DISCHARGE,
W71-00186 02J

GLACIAL EROSION, ICE RAFTING, AND GLACIAL-MARINE SEDIMENTS ANTARCTICA AND THE SOUTHERN OCEAN,
W71-00346 02J

MODEL SIMILARITY CONCERNING THE TRANSPORT OF SUSPENDED MATTER IN A TURBULENT FLOW FIELD,
W71-00358 08B

AUTOMATIC DEVICE FOR PLOTTING PROFILES OF HYDRAULIC MODELS,
W71-00360 07C

TURBID BOTTOM WATER ON THE CONTINENTAL SHELF OF THE NORTHERN BERING SEA,
W71-00390 02J

SEDIMENT YIELD
SEDIMENT YIELDS OF WISCONSIN STREAMS,
W71-00050 02J

SEDIMENTARY STRUCTURES
OSCILLATION RIPPLEMARKS AND ORBITAL DIAMETER,
W71-00035 02J

FORMATION OF THE BARRIER SPIT AND OTHER SAND RIDGES NEAR CHILKA LAKE ON THE EAST COAST OF INDIA,
W71-00365 02J

MAGNETIC PROPERTIES OF SOME CANYON SEDIMENTS,
W71-00366 02J

MAGNETIC FABRIC OF SEDIMENTS FROM THE SHELF AT LA JOLLA (CALIFORNIA),
W71-00367 02J

SEDIMENTATION
FORMATION OF THE BARRIER SPIT AND OTHER SAND RIDGES NEAR CHILKA LAKE ON THE EAST COAST OF INDIA,
W71-00365 02J

PATTERN FORMING FORCES IN DELTAS,
W71-00384 02J

SOURCE AND DISPERSION OF SURFACE SEDIMENTS IN THE GULF OF MAINE--GEORGES BANK AREA,
W71-00387 02J

THE LATERIAL DISTRIBUTION OF CLAY MINERALS IN LAKES PONTCHARTRAIN AND MAUREPAS, LOUISIANA,
W71-00391 02J

SEDIMENT PROBLEMS IN URBAN AREAS,
W71-00393 04C

SEDIMENTATION RATES
EVIDENCE OF SEDIMENTATION BY GRAVITY-ASSISTED BOTTOM CURRENTS IN THE MEDITERRANEAN SEA,
W71-00368 02J

SEDIMENTS
SEDIMENT-SEAWATER INTERACTION IN GLACIOMARINE SEDIEMENTS OF SOUTHEAST ALASKA,
W71-00027 02K

ADSORPTION AND DESORPTION OF INORGANIC PHOSPHORUS BY LAKE SEDIMENTS IN A 0.1 (MOLE) NACL SYSTEM,
W71-00115 02J

REPEATABILITY OF THREE INSTRUMENTS USED TO DETERMINE THE UNDRAINED SHEAR STRENGTH OF EXTREMELY WEAK, SATURATED, COHESIVE SEDIMENTS,
W71-00389 07B

SEDIMENT-WATER INTERFACES
ON THE FAUNA OF ASELIDAE IN THE BED OF A TRIBUTARY OF THE SAONE (IN FRENCH),
W71-00103 02F

SEEPAGE
UNSTEADY SEEPAGE TOWARD NARROW DITCH,
W71-00021 04A

EFFECTS OF GROUNDWATER SEEPAGE ON FLUVIAL PROCESSES,
W71-00028 02F

GOODWIN V TEXAS CO (LIABILITY FOR DAMAGES FOR SEEPAGE OF COLLECTED WATER AND OBSTRUCTION OF WATERCOURSE).
W71-00512 06E

WHITE RIVER CHAIR CO V CONNECTICUT RIVER POWER CO (DEFENDANT'S DAM ALLEGED TO HAVE RAISED WATER LEVELS, FLOODING PLAINTIFF'S PROPERTY).
W71-00546 06E

SEICHES
A METHOD FOR OBTAINING ANALYTICAL SOLUTIONS TO THE EQUATION FOR WIND-DRIVEN CIRCULATION IN A SHALLOW SEA OR LAKE,
W71-00192 02H

SELECTION
ENGINEERING AND ECONOMIC RELATIONS IN THE SELECTION AND CLASSIFICATION OF IRRIGABLE LANDS,
W71-00262 06B

SELF-PURIFICATION
SANITARY BIOLOGICAL CONDITIONS, PROCESSES OF SELF-PURIFICATION AND CONTENT OF TRACE ELEMENTS IN THE WATERS OF THE RIVERS OF THE SHEKI-ZAKATALY ZONE OF AZERBAYDZHAN,
W71-00220 05B

THE ROLE OF HIGHER WATER PLANTS IN THE SELF-PURIFICATION OF OIL-POLLUTED RIVERS,
W71-00223 05B

SEMIARID CLIMATES
LINEAR PROGRAMMING MODEL FOR ESTIMATING THE AGRICULTURAL DEMAND FUNCTION FOR IMPORTED WATER IN THE PECOS RIVER BASIN,
W71-00165 06D

SEPTIC TANKS
TOWN OF DICKSON V STEPHENS (SPECIAL DAMAGE REQUIRED TO RECOVER FOR POLLUTION DAMAGE FROM MUNICIPALITY).
W71-00425 06E

SEQUOYAH COUNTY(OKLAHOMA)
OPPORTUNITIES FOR DEVELOPMENT OF RIVER PORTS ON THE ARKANSAS RIVER WATERWAY SYSTEM SALLISAW, OKLAHOMA.
W71-00456 03E

SERVITUDE
HARRISON V GRANDISON CO (STATE OWNERSHIP OF BEDS UNDER NAVIGABLE WATERS).
W71-00419 06E

SETTLING BASINS
FEASIBILITY OF A STABILIZATION-RETENTION BASIN IN LAKE ERIE AT CLEVELAND, OHIO.
W71-00411 05D

SETTLING VELOCITY
VIRTUAL MASS OF PLATES AND DISCS IN WATER,
W71-00022 08B

SEWAGE
BIOLOGICAL AND CHEMICAL INVESTIGATIONS ON THE EFFECT OF SEWAGE ON THE EUTROPHICATION OF BAVARIAN LAKES,
W71-00117 02H

WATER AND SEWER REPORT.
W71-00420 05D

RICHMOND REGIONAL SEWERAGE PLAN AREA WIDE PLAN FOR LONG RANGE DEVELOPMENT.
W71-00445 05G

SEWAGE DISPOSAL
DETROIT TRUST CO V DINGMAN (AUTHORITY OF DRAINAGE DISTRICTS TO ALLOW INCIDENTAL SEWAGE DISPOSAL THROUGH DRAINAGE SYSTEM).
W71-00092 06E

POOVEY V CITY OF HICKORY (CITY'S LIABILITY FOR WATER POLLUTION RESULTING FROM SEWAGE DISPOSAL).
W71-00162 06E

CITY OF NEW BRUNSWICK V BOROUGH OF MILLTOWN (MUNICIPAL DISPOSAL OF WASTES).
W71-00328 06E

EFFECTS OF SAN DIEGO'S WASTE WATER DISCHARGE ON THE OCEAN ENVIRONMENT,
W71-00347 05C

TOWN OF DICKSON V STEPHENS (SPECIAL DAMAGE REQUIRED TO RECOVER FOR POLLUTION DAMAGE FROM MUNICIPALITY).
W71-00425 06E

PRELIMINARY REPORT ON GEOHYDROLOGIC EXPLORATION FOR DEEP WELL DISPOSAL OF EFFLUENT, WAIMANALO SEWAGE TREATMENT PLANT, OAHU,
W71-00430 05E

LINEBERGER V RUBY COTTON MILLS, INC (INJUNCTION AGAINST SEWER MAINTENANCE).
W71-00526 06E

ANDERSON V TOWN OF WAYNESVILLE (MUNICIPALITIES' LIABILITY FOR POLLUTION CAUSED BY SEWAGE DISCHARGE).
W71-00527 06E

SEWAGE OVERFLOWS
PROPOSED COMBINED SEWER CONTROL BY ELECTRODE POTENTIAL.
W71-00479 05G

SEWAGE TREATMENT
HIGH-RATE, FINE-MESH SCREENING OF COMBINED WASTE WATER OVERFLOWS,
W71-00127 05D

ROTARY VIBRATORY FINE SCREENING OF COMBINED SEWER OVERFLOWS, PRIMARY TREATMENT OF STORM WATER OVERFLOW FROM COMBINED SEWERS BY HIGH-RATE, FINE-MESH SCREENS.
W71-00476 05D

SEWERS
CHEMICAL CONTROL OF TREE ROOTS IN SEWER LINES,
W71-00137 05D

INVENTORY AND ANALYSIS OF EXISTING WATER SUPPLY SYSTEMS AND POTENTIAL SOURCES OF SUPPLY, VOLUME IV.
W71-00434 04A

WATER AND SEWERAGE STUDY, SECOND PHASE.
W71-00435 05G

ENGINEERING INVESTIGATION OF SEWER OVERFLOW PROBLEM - ROANOKE, VIRGINIA,
W71-00478 05G

STANDARD UTILITY LOCATIONS FOR THE CITY OF PHOENIX.
W71-00484 08A

LINEBERGER V RUBY COTTON MILLS, INC (INJUNCTION AGAINST SEWER MAINTENANCE).
W71-00526 06E

SHALLOW WATER
WAVE-HEIGHT PREDICTION FOR WAVE GENERATORS IN SHALLOW WATER,
W71-00143 08B

SHALLOW WELLS
ROLE OF INFILTRATION GALLERIES IN AUGMENTING SUPPLIES TO THE PUMPING WELLS IN THE DESERTS,
W71-00152 03B

SHEAR STRENGTH
DYNAMIC YOUNG'S MODULUS AND FLEXURAL STRENGTH OF SEA ICE,
W71-00043 02C

INFLUENCE OF GRAIN ORIENTATION ON DIRECT SHEAR STRENGTH OF A LOESSIAL SOIL,
W71-00260 08D

REPEATABILITY OF THREE INSTRUMENTS USED TO DETERMINE THE UNDRAINED SHEAR STRENGTH OF EXTREMELY WEAK, SATURATED, COHESIVE SEDIMENTS,
W71-00389 07B

SHEEP
IDENTIFICATION AND EXCRETION OF ESTROGEN IN URINE DURING THE ESTROUS CYCLE OF THE EWE,
W71-00330 05A

SHELVING AREAS
THE INFLUENCE OF LAKE LEVEL FLUCTUATION AND THE THERMOCLINE ON WATER CHEMISTRY IN TWO GRADUALLY SHELVING AREAS IN LAKE KARIBA, CENTRAL AFRICA,
W71-00101 02H

SHIPS
DISPOSAL OF RADIOACTIVE WASTES FROM U. S. NAVAL NUCLEAR-POWERED SHIPS AND THEIR SUPPORT FACILITIES, 1969,
W71-00030 05E

SHORE PROTECTION
WATER WAVE PRESSURE ON HORIZONTAL PLATE,
W71-00019 08B

SILICA
SILICATE MINERAL STABILITY AND MINERAL EQUILIBRIA IN THE GREAT LAKES,
W71-00204 02H

SIMPLEX METHOD
THE SYMMETRIC FORMULATION OF THE SIMPLEX METHOD FOR QUADRATIC PROGRAMMING,
W71-00298 06A

SIMULATION ANALYSIS
WATERSHED SIMULATION BY ELECTRONIC ANALOG COMPUTER,
W71-00072 02A

SIMULATION OF CONTINUOUS DISCHARGE AND STAGE HYDROGRAPHS IN THE NORTH BRANCH OF THE CHICAGO RIVER.
W71-00483 02E

SLOPES
USE OF CHANNEL SLOPE AND DISCHARGE TO DETERMINE REAERATION COEFFICIENTS FOR THE ELKHORN RIVER IN NEBRASKA,
W71-00176 05B

SLUDGE
DIATOMITE FILTRATION SLUDGE DISPOSAL (SUBCOMMITTEE PROGRESS REPORT),
W71-00125 05F

SLUDGE DISPOSAL
FEASIBILITY OF HYDROLYSIS OF SLUDGE USING LOW PRESSURE STEAM WITH SO-2 AS A HYDROLYTIC ADJUNCT AND UTILIZATION OF THE RESULTING HYDROLYSATE.
W71-00164 05D

SMALL WATERSHEDS
WATERSHED RESEARCH IN WESTERN NORTH CAROLINA - A STUDY OF THE EFFECTS OF AGRICULTURAL COVERS UPON THE HYDROLOGY OF SMALL WATERSHEDS.
W71-00033 04A

PEAK FLOW AND CRITICAL DURATION FOR SMALL WATERSHEDS,
W71-00061 02E

CHANNEL-SCARP FORMATION IN WESTERN NORTH DAKOTA,
W71-00185 04D

THE NUTRIENT CYCLES OF AN ECOSYSTEM,
W71-00374 02K

FLOOD HYDROLOGY OF SMALL WATERSHEDS EVALUATION OF TIME PARAMETERS AND DETERMINATION OF PEAK DISCHARGE,
W71-00403 02E

SOCIAL RATE OF DISCOUNT
RISK AND THE SOCIAL RATE OF DISCOUNT,
W71-00287 06B

SOIL
THICKNESS OF SOIL SOLUM AS A PARAMETER OF PLANT-AVAILABLE WATER STORAGE CAPACITY IN SOILS UNDERLAIN BY CARBONATE ROCKS,
W71-00414 02G

SOIL CLASSIFICATIONS
DESCRIPTION AND CLASSIFICATION OF FROZEN SOILS,
W71-00068 02C

SOIL EROSION
A METHOD OF COMPUTING SOIL MOVEMENT THROUGHOUT A FIELD,
W71-00069 02J

WATER-REPELLENT SOILS AND WETTING AGENTS AS FACTORS INFLUENCING EROSION,
W71-00157 02G

SEDIMENT PROBLEMS IN URBAN AREAS,
W71-00393 04C

SOIL FORMATION
NATURAL ORGANIC ACIDS AS AGENTS OF CHEMICAL WEATHERING,
W71-00174 02K

SOIL GASES
RESPONSE OF AGRICULTURAL CROPS TO FLOODING, DEPTH-OF-WATER TABLE AND SOIL GASEOUS COMPOSITION,
W71-00217 03F

SOIL HORIZONS
WATER-REPELLENT SOILS IN SOUTHERN CALIFORNIA,
W71-00155 02G

SOIL MOISTURE METERS
EVALUATION OF INSTALLATION METHODS FOR NEUTRON-METER ACCESS TUBES,
W71-00187 02G

SOIL NITROGEN TRANSFORMATIONS
EFFECT OF MANURE APPLICATION, AERATION, AND SOIL PH ON SOIL NITROGEN TRANSFORMATIONS AND ON CERTAIN SOIL TEST VALUES,
W71-00341 05D

SOIL PHYSICAL PROPERTIES
HUMIC SUBSTANCES FULVIC ACID-DIALKYL PHTHALATE COMPLEXES AND THEIR ROLE IN POLLUTION,
W71-00377 05B

SOIL PHYSICS
MEASUREMENT OF CONTACT ANGLE, WATER DROP PENETRATION TIME, AND CRITICAL SURFACE TENSION,
W71-00156 02G

SOIL PROPERTIES
WATER-REPELLENT SOILS AND ANNUAL PLANT COVER IN A DESERT SCRUB COMMUNITY OF SOUTHEASTERN CALIFORNIA,
W71-00158 02G

SOIL STRUCTURE
INFLUENCE OF GRAIN ORIENTATION ON DIRECT SHEAR STRENGTH OF A LOESSIAL SOIL,
W71-00260 08D

SOIL SURVEYS
RELATION OF PERCOLATION RATES TO SOIL TEXTURE ON SEVERAL INDIANA SOILS,
W71-00392 02G

REMOTE SENSING FOR RESOURCE MANAGEMENT AND FLOOD PLAIN DELINEATION,
W71-00415 07B

SOIL TEXTURE
OBSERVATIONS ON WATER-REPELLENT SOILS IN WESTERN UNITED STATES,
W71-00154 02G

RELATION OF PERCOLATION RATES TO SOIL TEXTURE ON SEVERAL INDIANA SOILS,
W71-00392 02G

SOIL WATER
THICKNESS OF SOIL SOLUM AS A PARAMETER OF PLANT-AVAILABLE WATER STORAGE CAPACITY IN SOILS UNDERLAIN BY CARBONATE ROCKS,
W71-00414 02G

SOIL WATER MOVEMENT
THEORY OF FLOW TO DRAINS,
W71-00007 02F

TWO-LIQUID FLOWS IN POROUS MEDIA,
W71-00009 02F

ESTIMATING STEADY-STATE EVAPORATION RATES FROM BARE SOILS UNDER CONDITIONS OF HIGH WATER TABLE,
W71-00370 02D

RELATION OF PERCOLATION RATES TO SOIL TEXTURE ON SEVERAL INDIANA SOILS,
W71-00392 02G

SOILS
PHASE BOUNDARY WATER IN FROZEN SOILS,
W71-00462 02C

SOIL-WATER-PLANT RELATIONSHIPS
EVAPOTRANSPIRATION AS AFFECTED BY PLANT DENSITY AND WATER-TABLE DEPTH,
W71-00402 02D

SOLAR RADIATION
ESTIMATES OF EVAPORATION IN EAST AFRICA IN RELATION TO CLIMATOLOGICAL CLASSIFICATION,
W71-00160 02D

SOLID WASTES
DEEP-SEA DISPOSAL OF LIQUID AND SOLID WASTES,
W71-00349 05E

SOLUTES
SOME ASPECTS OF THE DISTRIBUTION, CHEMISTRY, AND MINERALOGY OF SUSPENDED MATTER IN THE GULF OF MAINE,
W71-00364 02K

SOUTH AFRICA
PLANNING AND CONSTRUCTION OF WASTE WATER RECLAMATION SCHEMES AS AN INTEGRAL PART OF WATER SUPPLY,
W71-00427 05D

THE LOCAL GOVERNMENT PRESPECTIVE ON WASTE WATER,

WATER AND WASTE MANAGEMENT IN THE CAPE TOWN METROPOLITAN AREA,
W71-00431 05D

SOUTH CAROLINA
FLOOD PLAIN INFORMATION, FLORENCE, SOUTH CAROLINA.
W71-00067 04A

MACEDONIA BAPTIST CHURCH V CITY OF COLUMBIA (FLOODING FROM SURFACE DRAINAGE OF MUNICIPAL STREETS).
W71-00239 06E

SOME ECOLOGICAL RELATIONSHIPS OF THE ORGANIC DRIFT IN PRATER'S CREEK, PICKENS COUNTY, SOUTH CAROLINA,
W71-00303 05C

SOUTH DAKOTA
GEOLOGY AND WATER RESOURCES OF CAMPBELL COUNTY, SOUTH DAKOTA PART III-BASIC DATA,
W71-00210 02F

SOVEREIGNTY LANDS
JEFFERSON REALTY CO V BD OF COMM'R OF EVERGLADES DRAINAGE DIST (VALIDITY OF DRAINAGE DISTRICT TAXES ON SOVEREIGN LANDS).
W71-00074 06E

SPAWNING
THE INFLUENCE OF FLOW ON THE SPAWNING OF BROOK TROUT IN THE LABORATORY,
W71-00407 05C

WHITE SUCKER SPAWNING AND CULTURE OF THE YOUNG IN THE LABORATORY,
W71-00408 02H

SPECIFIC GRAVITY
SPECIFIC GRAVITY DETERMINATION OF MARINE SEDIMENTS,
W71-00461 02J

SPILLWAYS
CONSTRUCTION RECOMMENDATIONS, DESIGN CRITERIA AND THEIR APPLICATION,
W71-00264 08B

SPRAYS
CANNERY WASTE WATER TREATMENT BY HIGH-RATE SPRAY ON GRASSLAND,
W71-00134 05D

SPRINGS
A SEMIQUANTITATIVE METHOD FOR DETERMINING THE SOURCE OF SPRINGFLOW IN THE MISSOURI OZARKS,
W71-00181 02F

LARGE SPRINGS OF FLORIDA'S 'SUN COAST,' CITRUS AND HERNANDO COUNTIES,
W71-00207 02F

STAGE-DISCHARGE RELATIONS
WATER-SURFACE ELEVATIONS AND CHANNEL CHARACTERISTICS FOR SELECTED REACHES OF THE ROGUE RIVER AND ELK CREEK, JACKSON AND JOSEPHINE COUNTIES, OREGON,
W71-00190 02E

MAXIMUM KNOWN STAGES AND DISCHARGES OF NEW YORK STREAMS THROUGH 1967,
W71-00191 02E

HYDRAULICS OF BRIDGE WATERWAYS.
W71-00350 08B

WATER-SURFACE ELEVATIONS AND CHANNEL CHARACTERISTICS FOR A SELECTED REACH OF THE APPLEGATE RIVER, JACKSON COUNTY, OREGON,
W71-00353 02E

SIMULATION OF CONTINUOUS DISCHARGE AND STAGE HYDROGRAPHS IN THE NORTH BRANCH OF THE CHICAGO RIVER.
W71-00483 02E

STAGNANT WATER
CITY OF LOCKPORT V MCCOLLUM (RIGHT OF CITY TO ABATE NUISANCE CAUSED BY OBSTRUCTION TO STREAMFLOW).
W71-00522 06E

STANDARD UTILITY LOCATIONS
STANDARD UTILITY LOCATIONS FOR THE CITY OF PHOENIX.
W71-00484 08A

STANDARDS
WATER QUALITY CRITERIA FOR SELECTED RECREATION USES,
W71-00471 06B

STATE JURISDICTION
STATE V RUVIDO (DEFINITION OF TERRITORIAL WATERS IN CRIMINAL PROSECUTION FOR VIOLATION OF TERRITORIAL LIMITS).
W71-00300 06E

PEOPLE V REILLY (RIGHT TO REGULATE ACTIVITIES OVER OWNED BEDS).
W71-00503 06E

STATISTICAL ANALYSIS
COMMENT ON FACTOR ANALYSIS AND REGRESSION,
W71-00302 06A

STATISTICAL METHODS
MANAGEMENT EVOLUTION IN THE QUANTITATIVE WORLD,
W71-00286 06B

STATISTICAL MODELS
JOINT PROBABILITY METHOD OF TIDE FREQUENCY ANALYSIS APPLIED TO ATLANTIC CITY AND LONG BEACH ISLAND, N. J.,
W71-00378 04A

STEAM
STEAM INJECTION, OIL RECOVERY TECHNIQUES, AND WATER QUALITY,
W71-00371 05G

STEAM GENERATOR
MULTIPLE PHASE EJECTOR PILOT PLANT,
W71-00482 03A

STEEL
STEEL INDUSTRY WASTES (LITERATURE REVIEW),
W71-00121 05D

STEEL INDUSTRY
WATER POLLUTANT OR REUSABLE RESOURCE.
W71-00140 05D

STEEL LININGS
ROCK PROPERTIES AND STEEL TUNNEL LINERS,
W71-00269 08E

STEEL WASTES
TREATMENT OF WASTE EATER - WASTE OIL MIXTURES.
W71-00410 05D

STOCHASTIC PROCESSES
STOCHASTIC ASPECTS OF LAKE ONTARIO EVAPORATION,
W71-00233 02D

MULTIRESERVOIR OPERATION STUDIES,
W71-00281 06A

STORAGE
COMPILATION OF HYDROLOGIC DATA, COW BAYOU, BRAZOS RIVER BASIN, TEXAS, 1968.
W71-00216 02E

STORM DRAINS
HALE V KANSAS CITY, MO (CITY'S LIABILITY FOR FLOOD DAMAGE CAUSED BY FAILURE TO OPEN FLOODGATE DURING RAINSTORM).
W71-00444 06E

STORM RUNOFF
THE BENEFICIAL USE OF STORM WATER, FINAL REPORT, A SYSTEM STUDY, DESIGN, AND EVALUATION OF THE LOCAL STORAGE, TREATMENT, AND REUSE OF STORM WATER.
W71-00409 05D

PURYEAR V NIELSON (EFFECTS OF SURFACE WATER DIVERSION ON ADJACENT LANDOWNER).
W71-00549 06E

STORM SEWERS
SURFACE STORM WATER RUNOFF AND DRAINAGE STUDY FOR ESSEX COUNTY, NEW JERSEY.
W71-00448 04A

STORM DRAINAGE IN THE TOLEDO REGIONAL AREA.
W71-00454 04A

STORM STRUCTURE
METEOROLOGICAL ASPECTS OF HURRICANE CAMILLE--AUGUST 14-22, 1969,
W71-00382 02B

STORMS
OBSERVATIONS OF WATERSPOUTS AND THEIR PARENT CLOUDS,
W71-00038 02B

SURFACE STORM WATER RUNOFF AND DRAINAGE STUDY FOR ESSEX COUNTY, NEW JERSEY.
W71-00448 04A

STREAM EROSION
SEDIMENT-PICKUP FUNCTION,
W71-00017 02J

EFFECTS OF GROUNDWATER SEEPAGE ON FLUVIAL PROCESSES,

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWQA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

Supported by the Federal Water Quality Administration in cooperation with WRSIC.

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.
- Agricultural Livestock Wastes at the Department of Agricultural Engineering of Iowa State University.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 4, NUMBER 2
JANUARY 15, 1971

THE LIBRARY OF THE
FEB 24 1971

W71-00551 -- W71-01100

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information will now be provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $22 (domestic), $27.50 (foreign), single copy price $3. Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 4, NUMBER 2
JANUARY 15, 1971

W71-00551--W71-01100

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency A directory of the Centers appears on inside back cover.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1954, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SELECTED WATER RESOURCES ABSTRACTS

01. NATURE OF WATER

1A. Properties

STATISTICAL MODELS FOR SURFACE RENEWAL IN HEAT AND MASS TRANSFER, PARTS III. AND IV.,
Argonne National Lab., Ill.
L. B. Koppel, R. D. Patel, and J. T. Holmes.
AIChE Journal, 16 (1970), No 3, p 456-471; 5 fig, 2 tab, 15 ref.

Descriptors: *Interfaces, Boundary processes, *Heat transfer, *Mass transfer, Boundaries, *Statistical models, Frequency analysis, Systems analysis, Surfaces, Diffusion.
Identifiers: Fluid mechanics.

A method was developed for estimating the age density of transporting elements at a transport surface by using the spectral density of the total element counts. Only total counts, and not individual element histories, need be observed. The method was compared with autocorrelation methods used in an earlier work. Residence times were measured for several sizes of particles at a particular wall surface of a stirred fluidized bed and at various gas velocities using both spectral density and autocorrelation methods. A dimensionless plot brought all data points near a single curve, valid only for this surface in this bed. Checks of these residence times against values obtained by direct observation of individual particles confirmed the methods. Heat transfer coefficients were measured for glass particle at the same wall surface of a fluidized bed for which glass particles residence times were measured in a previous study. The data compared well with theoretical predictions of the dependence of heat transfer coefficients on particle residence times. Heat transfer coefficients for metal particle systems, for which direct measurements of residence times were not available, were predicted with fair accuracy by estimating residence times from a dimensionless correlation proposed in a previous study. The ability of the particle surface renewal models to accurately predict heat transfer coefficients is strong evidence of their physical validity. (Novotny-Vanderbilt)

THERMODYNAMIC PROPERTIES OF LIQUID H2O AND D2O AND THEIR MIXTURES,
National Aeronautics and Space Administration, Cambridge, Mass. Electronics Research Center.
Mark Salomon.
For sale by NTIS as NASA TND-5223, $3.00 in paper copy, $0.95 in microfiche. National Aeronautics and Space Administration Technical Note D-5223, May 1969. 12 p, 5 tab, 27 ref.

Descriptors: *Water properties, *Deuterium, Thermodynamics, *Enthalpy, Thermal properties, Data collections, Physicochemical properties, Chemical properties, Chemical reactions.
Identifiers: Equilibrium constants.

The liquid and gas phase equilibria H2O .. D2O — HDO have been reinvestigated. By combining spectroscopic and vapor pressure data, fairly good agreement is found between the experimental and calculated enthalpy for the liquid phase reaction. The value of the equilibrium constant for the liquid phase reaction is very close to the geometric mean value of 4.0. (Knapp-USGS)
W71-00887

1B. Aqueous Solutions and Suspensions

ADSORPTION OF ORGANIC COMPOUNDS ONTO SOLIDS FROM AQUEOUS SOLUTIONS,
Virginia Polytechnic Inst., Blacksburg.
James P. Wightman, Leslie R. Dole, Clarence A. King, and Russell K. Lengel.
Available from NTIS as PB-195 309, $3.00 in paper copy, $0.95 in microfiche. Virginia Water Resources Research Center Bulletin, Completion Report, October 1970. 12 p. OWRR Project A-026-VA (1).

Descriptors: *Adsorption, *Surface tension, *Surfaces, Aqueous solutions, Phenol, Polarity, Wettability.
Identifiers: *Gas chromatography, *Surface area, *Critical surface tension, Infrared spectra, Polymers.

The research involved a study of factors effecting adsorption of phenol from aqueous solution on six solids of varying polarity including polymers of known surface area. The amount of phenol adsorbed over a wide range of phenol concentration was determined by a gas chromatographic technique. The critical surface tensions of the polymers were determined by contact angle measurements. Reflection infrared spectra were obtained on the powdered solids. Anomalously large quantities of phenol were taken up by microcrystalline Nylon presumably by an adsorption process.
W71-00633

INFLUENCE OF SURFACE TURBULENCE AND SURFACTANTS ON GAS TRANSPORT THROUGH LIQUID INTERFACES,
California Univ., Berkeley.
Thomas G. Springer, and Robert L. Pigford.
Industrial Engineering Chemical Fundamentals, Vol 9, (1970), No 3, p 458-465. 8 fig, 5 tab, 17 ref.

Descriptors: *Boundary processes, *Air-water interfaces, Mass transfer, Heat transfer, Evaporation, Convection, *Turbulence, Statistical models, Mathematical models, Diffusion, *Surfactants.

A new experimental technique is used to measure the effects of surface turbulence and surfactants on mass transfer rates at gas-liquid interfaces. At high turbulence rates the statistical nature of interfaces, with and without surfactants present, may be described by a Danckwerts-type distribution function of surface ages. Measurements of surface film mass transfer resistances show that soluble surfactants offer no measurable resistance, while insoluble films show definite resistance to passage of gas molecules. The nature of surface films and their stability in the presence of interfacial turbulence are discussed. The results were drawn from data taken at high turbulence rates, where the scale of turbulence was much greater than the depth of penetration of the dissolving gas. In all turbulent runs, no visual change in the surface turbulence could be seen. (Novotny-Vanderbilt)
W71-00646

ION-ION AND ION-MOLECULE INTERACTIONS IN AQUEOUS SALT SOLUTIONS,
Connecticut Univ., Storrs. Inst. of Water Resources.
W. L. Masterton.
Available from NTIS as PB-195 312, $3.00 in paper copy, $0.95 in microfiche. Technical Completion Report, June 30, 1970. 5 p. OWRR Project A-013-CONN (7).

Descriptors: Osmosis, *Ions, *Electrolytes.
Identifiers: *Salt effect, *Osmotic coefficient, Complex ion electrolyte, Apparent molal value, Activity coefficient, Partial molal value, Solubility nonelectrolytes, Ion pair, Conductivity.

Studies have been carried out on the thermodynamic properties and structure of aqueous solutions of complex ion electrolytes derived from cobalt (III). The work involves the determination of osmotic and activity coefficients, conductivities, salt effects and partial molal volumes. The data indicates that complex ion electrolytes in aqueous solution are more strongly ion paired than simple salts of the same valence type. Aromatic hydrocarbons are salted in by complex ion electrolytes.

PROTON MAGNETIC RESONANCE STUDY OF COUNTERION AND SOLVENT EFFECTS ON 14N QUADRUPOLE RELAXATION IN TETRAALKYLAM-MONIUM IONS,
Missouri Univ., Kansas City. Dept. of Chemistry.
David W. Larsen.
Journal of Physical Chemistry, Vol 74, No 18, p 3380-3384, September 1970. 2 fig, 1 tab, 26 ref. OWRR Project A-022-MO (1).

Descriptors: *Electrolytes, Aqueous solutions, *Ions, *Soluation, Water properties, Water structure, Equilibrium, Ionization, Diffusion, Viscosity.
Identifiers: *Ion pairing, Detergents.

Nuclear magnetic resonance lineshapes for ocmethyl protons in (CH3)4N (..) and (CH3)3NCH2CH3 (..) salts were studied. The dependence of the lineshapes on salt concentration, added electrolyte concentrations, solvent, and temperature was studied. The observed effects are caused by the N (14) quadrupole relaxation rate, which is governed by the nature of fluctuating field gradients at the N (14) nucleus. Electric field gradients and correlation times are discussed in terms of structure of the cations, solvent interactions, and ion pairing. The small temperature dependence of the lineshapes suggests that the correlation decay mechanism is rotation of the cation. The results are interpreted in terms of contact ion pairs in dimethyl-sulfoxide solution and solvent separated ion pairs in aqueous solution. The present results for R4N (..)X (-) ion pairs are in agreement with previous results for R4N (..)MXn (3-) ion pairs from studies of n.m.r. pseudocontact effects.

02. WATER CYCLE

2A. General

PREDICTING AND MAPPING THE AVERAGE HYDROLOGIC RESPONSE FOR THE EASTERN UNITED STATES,
Georgia Univ., Athens.
James F. Woodruff, and John D. Hewlett.
Water Resources Research, Vol 6, No 5, p 1312-1326, October 1970. 15 p, 4 fig, 3 tab, 10 ref. OWRR Project A-d18-GA.

Descriptors: *Rainfall-runoff relationships, *Storm runoff, *Mapping, *Small watersheds, Synoptic analysis, Drainage patterns (Geologic), Maps, Runoff forecasting, Streamflow forecasting, Discharge (Water), Data collections, Hydrologic data, Hydrogeology, Flood forecasting, Water storage, Stream gages, Gaging stations.

An attempt was made to predict the average annual hydrologic response (ratio of annual direct runoff to annual precipitation) of ungaged watersheds in the East by regression against 15 planimetric, hypsometric, and land use factors available on 90 selected test basins (2 to 100 square miles) from New York to Alabama. The regression coefficients were nonsignificant indicating that the average percentage of a basins's annual precipitation that will become quick flow cannot be predicted from available basin morphometry and implying that response is controlled chiefly by porous mantle factors not measurable on normal data sources. A hydrologic response map of the eastern United States based on an expanded set of 201 basins up to 200 square miles revealed specific regions of high flood producing potential clearly related to geologic provinces. It is suggested that hydrologic response is a meaningful parameter that may be best derived by measuring precipitation and

streamflow by cheap, short-term methods traditionally rejected as uneconomical. (Knapp-USGS)

PARTIAL AREA CONTRIBUTIONS TO STORM RUNOFF IN A SMALL NEW ENGLAND WATERSHED,
Agricultural Research Service, Danville, Vt.
Thomas Dunne, and Richard D. Black.
Water Resources Research, Vol 6, No 5, p 1296-1311, October 1970. 16 p, 11 fig, 1 tab, 16 ref.

Descriptors: *Storm runoff, *Rainfall-runoff relationships, *Small watershed, *Overland flow, Soil water movement, Hydrogeology, Soil water, Permeability, Precipitation excess, Depth-area-duration analysis, Percolation, Rainfall disposition.
Identifiers: Sleepers River Experimental Watershed (Vt).

During an experimental study of runoff producing mechanisms in a small drainage basin, the major portion of storm runoff was produced as overland flow on a small proportion of the watershed. Where the water table intersected the ground surface before and during a storm, water ran quickly to the stream at velocities 100 to 500 times those of the subsurface system. Direct precipitation onto the saturated area was another major contributor of storm flow. Storage of water was small and travel times out of them were short. These areas contributing quick runoff could expand or contract seasonally or during a storm. Their position and expansion can be related to geology, topography, soils, and rainfall characteristics. In the study basin, water that remained below the ground surface on its way to the main stream channel was a relatively minor contributor to the storm hydrograph. Measurements of water table elevation and runoff from experimental plots in another small watershed with different geologic conditions confirmed the results. Runoff records from a large number of small basins of the Sleepers River experimental watershed indicate the general applicability of these findings. (Knapp-USGS)

Water Resources Research, Vol 6, No 5, p 1277-1286, October 1970. 10 p, 16 fig, 7 ref. OWRR Project C-1146.

Descriptors: *Rainfall-runoff relationships, *Mathematical models, *Hydrograph analysis, Time series analysis, Parametric hydrology, Systems analysis.
Identifiers: Non-linear models.

The developed nonlinear time varying model of a hydrologic system that relates the rainfall and the runoff is represented by a pair of nonlinear ordinary differential equations with time varying coefficients. The model does not require the linearity and time invariance assumptions necessary in conventional unit hydrograph methods. The nonlinear and time varying characteristics of the system are incorporated into the model through four basic system parameters. The model is empirical and its field application procedure is feasible and simple, since its derivation is based on the physical system response observed. In an illustrative field application the model and procedure proved effective, relative to other linear time invariant models, in predicting the rain-runoff relation, especially when the rainfall excess occurred during a very short time interval. AN UNCONVENTIONAL APPROACH TO FLOOD FREQUENCY ANALYSIS,
Technion - Israel Inst. of Tech., Haifa.
Joseph S. Dalinsky.
Bulletin International Association of Scientific Hydrology, Vol 15, No 3, p 55-59, September 1970. 5 p, 5 ref.

Descriptors: *Rainfall-runoff relationships, *Statistical methods, *Flood forecasting, *Frequency analysis, Rain gages, Data collections, Hydrologic data, Meteorological data, Data processing, Digital computers, Mathematical models.
Identifiers: Flood frequency.

It is suggested that flood-frequency analysis be based on regional rainfall analysis, a combination of physical and statistical analyses making use of all data. The statistical analysis should refer mainly to rainfall data. Rainfall data are more numerous, especially as data from a number of stations of the same region can be used simultaneously or alternately, as long as their rainfall regimes and rainfall quality are identical. Rainfall data are more reliable and easier to measure. Rainfall is stochastic. Generally, the known frequency distribution of rainfall intensities of different durations is log-normal, or nearly so. An analysis of rainfall-runoff relations should be based not only on all reliable data, but also on an understanding of the physical nature of hydrologic processes. (Knapp-USGS)

ON THE COMPUTER EVALUATION OF THIESSEN WEIGHTS,
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center.
M. H. Diskin.
Journal of Hydrology, Vol 11, No 1, p 69-78, July 1970. 10 p, 2 fig, 2 tab, 2 ref.

Descriptors: *Rainfall-runoff relationships, *Runoff forecasting, *Computer programs, *Small watersheds, *Routing, Hydrograph analysis, Networks, Data processing, Rain gages, Digital computers.
Identifiers: Thiessen weights, Thiessen method.

To shorten the time required for rainfall-runoff calculations in watersheds, an improved method is presented for evaluating the Thiessen weights or coefficients by a digital computer. The new method is based on covering the area of the watershed with uniform, equally spaced test points on a rectangular grid and assigning each such point to the nearest rain-gaging station. The number of points assigned to any station relative to the total number of points that fall inside the boundaries of the watershed gives the weight of the station. The new procedure is faster and gives more accurate results than a previous program based on random test points. The complete listing of the new computer program in Fortran IV may be obtained from the author or from the Southwest Watershed Research Center Tucson, Arizona. (Knapp-USGS)

Identifiers: France.

To establish the relative proportions of surface-r noff and groundwater discharge it is possible measure the amounts of tritium in rainwate groundwater, and the outflow from a particul drainage basin. From such data, the part of t total discharge due to direct runoff can established. At Pont des Blaves, France, the great part of the flood waters passing on 11/7/1968 a peared to consist of displaced groundwater. To lesser extent this proved also to be the case with t discharge at Charmoisy (2/8/1968), situated with the same drainage basin. On the other hand, t discharge at Verthier (23 to 29/12/1968) was la gely due to precipitation. Earlier radiometr methods have used Sr-90 and Cs-137 as indicato Tritium, however, is to be preferred because it not adsorbed by the soil. The proposed meth should give insight into water balance and esp cially into the hydrological cycle in drainage basi (Knapp-USGS)

THE PROGRESS OF HYDROLOGY: VOL NEW DEVELOPMENTS IN HYDROLOGY.
Illinois Univ., Urbana.

Ven Te Chow, Chairman. Proceedings 1st Intern tional Seminar for Hydrology Professors, Illin University, Urbana, July 13-25, 1969, published Univ of Illinois, 1969. 509 p.

Descriptors: *International Hydrological Decade, *Conferences, *Research and development, *Water resources development, Forecasting, Hydrology, Hydraulics, Planning, Projects, Research facilities, Exploration, Economics, Instrumentation, Laboratories, Model studies, Technology, Computers.
Identifiers: *Water resources research.

In recent years there has been a tremendous amount of activity in the field of hydrology. The International Hydrological Decade which began in 1965 is just one example of such activities. As it is generally recognized that the science of hydrology is basic to all plans of water resources development, new national and international attention and interest in water resources have further stimulated the progress of hydrology. These activities have exposed two significant facts: (1) new technologies applicable to hydrology are being rapidly developed, and (2) urgent need for modern hydrologic education is well recognized in government as well as in scientific communities. As a first step to meet the need for a progressive hydrologic education, an International Seminar for Hydrology Professors was held from July 13 to 25, 1969, in Urbana, Illinois, U.S.A. The theme of the seminar was limited to new developments in the field of hydrology, to hydrologic teaching and research at colleges and universities, and to the relation of hydrology with governments, society and professions. A total of 62 papers were presented and preprinted for distribution at the seminar. Of these papers, 20 were on new developments in hydrology, 19 on specialized subjects in hydrology, 10 on hydrologic education, and 13 on various country reports. Over the past 50 years hydrology has evolved from a largely descriptive science of the natural hydrologic cycle. Hydrology is in the process now of adapting technologies which have come in part from outside of hydrology for improved sensing, statistical evaluation, electronic calculation, and systems analyses. One of societies' problems is with quality of the environment, and a part of the response to this should be by far greater concern with natural and degraded water quality as well as the traditional concern with quantity. Identifiers: *Water resources research.

The present state of the science of hydrology is summarized for an IHD seminar held in 1969. A major part of international scientific effort in hydrology falls within the program of the International Hydrological Decade which, first proposed in 1961 was implemented under a Coordinating Council of UNESCO January 1, 1965. Efforts of the IHD fall into the general categories of (1) basic data; (2) inventories and water balances; (3) research projects; (4) exchange of information, symposia and publication, and (5) education and training in hydrology. The developing countries tend to place highest priority on development of their resources in order to meet the extremely pressing needs for economic growth; whereas, the developed countries tend to give relatively higher priority to environmental problems as such, and to the more sophisticated scientific problems. DETERMINISTIC NONLINEAR HYDROLOGIC MODELS,
Geological Survey, Washington, D.C.
J. Amorocho.
In: The Progress of Hydrology, Vol 1 - New Developments in Hydrology, Proceedings 1st International Seminar for Hydrology Professors, Illinois University, Urbana, July 13-25, 1969, p 420-472, published by Univ of Illinois, 1969. 53 p, 12 fig, 37 ref.

Descriptors: *International Hydrological Decade, *Conferences, *Research and development, *Model studies, *Mathematical models, Parametric hydrology, Forecasting, Hydrology, Hydraulics, Simulation analysis, Input-Output analysis, Operations research, Planning, Research facilities, Systems analysis, Model studies, Technology, Computers.
Identifiers: *Water resources research.

The deterministic approach has been very fruitful in the development of a number of techniques for the representation of various elements of the hydrologic cycle, and has led to useful results in practical application. Completely general models applicable to all circumstances are not available, but such generality may neither be necessary nor entirely desirable. While the types of models discussed operate in a deterministic manner on the input data supplied, the results of their operation must always be interpreted in a statistical sense. New techniques to handle the model uncertainties in terms of the risk associated with the use of model outputs are needed to make these methods truly effective for water resources planning and design. POSSIBILITY OF FORECASTING THE AREAL WATER TEMPERATURE DISTRIBUTION,
M. G. Glagoleva.
Translation from Trudy GMTs, No 51, p 75-85, 1969. Soviet Hydrology: Selected Papers, Issue No 3, p 252-257, 1969. 6 p, 5 fig, 3 tab, 7 ref.

Descriptors: *Water temperature, *Forecasting, *Oceans, *Atlantic Ocean, *Areal, Surface waters, Atmospheric pressure, Meterological data, Fishing, Mathematical studies, Computer programs, Equations, Regression analysis, Foreign projects.
Identifiers: *Russia, North Atlantic.

Methods of utilizing hydrometerological data to forecast areal ocean-water temperatures (needed as an aid in the fishing industry) are described. A mathematical method of comparing the atmospheric pressure with the water temperature distribution in the North Atlantic from data collected on weather ships is emphasized. The ocean water temperature in summer is determined mainly by the state of the atmosphere in the preceding winter. Therefore, the distribution of water temperature anomalies at the surface in the North Atlantic in August was compared with the pressure field over the ocean and neighboring regions in January and February. The coefficients of expansion in series of natural components were used as the indexes of the water temperature and atmospheric pressure fields. Equations were obtained on an electronic computer for each coefficient of the field of water temperature anomalies by the method of multiple correlations. Similar equations for forecasting the coefficients of the field of water temperature anomalies were obtained for other months. The study shows not only that long-range water temperature forecasts can be issued for individual points, but also that the areal distribution of water temperature can be forecast. Related maps, graphs, and tables of data are included. (Woodard-USGS)

CAUSES OF LONG-PERIOD STREAMFLOW FLUCTUATIONS,
N. P. Smirnov.
Translation from (Izvestiya VGO), Vol 10, No 5, p 433-440, 1969. Soviet Hydrology: Selected Papers, Issue No 3, p 308-314, 1969. 7 p, 5 fig, 27 ref.

Descriptors: *Streamflow, *Fluctuation, *Climatic data, Solar radiation, Earth (Planet), Polarity, Atmosphere, Tides, Rivers, Flow rates, Gravity.
Identifiers: *Earth rotation, Volga River, Dnieper River (USSR).

Physiography factors and climatic conditions concerning causes of fluctuations in the supply of water and flow of rivers over long periods are discussed. The influences of extraterrestrial factors on climate are emphasized with relationship graphs constructed from data pertaining to the Volga and Dnieper Rivers in the USSR as follows: (1) Comparison of variations of the long-period part of the tide-producing force with flow anomalies of the

Volga at Volgograd, (2) comparison of variations in the long-period part of the tide-producing force with flow anomalies of the Dnieper at Kiev, (3) comparison of mean annual relative sunspot numbers with the flow anomalies of the Volga at Volgograd, (4) comparison of the Y component of the radius-vector of the pole of rotation of the earth in February with flow anomalies of the Volga at Volgograd, and (5) comparison of the Y component of the radius-vector of the pole of rotation of the earth in February with flow anomalies of the Dnieper at Kiev. The results indicate that flow fluctuations are governed largely through atmospheric circulation by variations in tide-producing forces, solar activity, and the forces of deformation arising from the nutational fluctuations of the pole of rotation of the earth. (Woodard-USGS)

APPROXIMATE ESTIMATE OF THE POSSIBLE UTILIZATION OF THE WATER RESOURCES OF KAZAKHSTAN,
P. F. Lavrent'yev, and L. D. Lavrent'yeva.
Translation from Trudy KazNIGMI, No 32, p 89-99, 1969. Soviet Hydrology: Selected Papers, Issue No 3, p 270-279, 1969. 10 p, 2 fig, 5 tab, 6 ref.

Descriptors: *Water supply, *Water resources, *Surface waters, *Water utilization, *Foreign projects, Rivers, Runoff, Streamflow, Reservoirs, Water yield, Water loss, Water storage, Precipitation (Atmospheric).
Identifiers: *Kazakhstan (USSR).

Data of developed projects for long-period storage reservoirs were used to estimate the surface water resources that can be practically utilized in Kazakhstan, U.S.S.R. The coefficient of flow utilization which characterizes the ratio of the maximum economically feasible volume of regulated net yield to the mean annual volume of the potential surface-water resources, was used as the conversion factor from potential surface-water resources to the resources that can be utilized in practice. The flow-utilization coefficient corresponds to a given probability of yield. Most of the large rivers of Kazakhstan are of importance to several republics and countries since the upper parts of their basins are located outside the borders of the republic. Therefore, in estimating the water resources of Kazakhstan that can be used in practice, allowance must be made for the requirements of neighboring republics and countries. Related maps, graphs, and tables of data are included. (Woodard-USGS)

FOREST HYDROLOGY AND EXTREME RAINFALL FREQUENCY,
Missouri Univ., Columbia. School of Forestry.
Carl D. Settergren.
Water Resources Bulletin, Vol 6, No 5, p 775-783, September-October 1970. 9 p, 6 fig, 1 tab, 2 ref.

Descriptors: *Rainfall, *Frequency analysis, *Forests, Rainfall-runoff relationships, Hydrograph analysis, Runoff forecasting, Streamflow forecasting, Peak discharge.
Identifiers: Forest hydrology, Rainfall extremes.

Extreme rainfall frequency analysis provides a means to predict the average time interval between the recurrences of storms of a specified duration and magnitude. This furnishes the forest hydrologist a valuable tool for engineering design and runoff and erosion forecast. A modification in the application of the annual maximum and annual exceedance series analysis described by V. T. Chow can, for special purposes, lead to an even more useful estimate of extreme events on a seasonal basis. This can be particularly important on small forested headwater watersheds where the runoff response to extreme rainfall may vary considerably with seasonal changes in canopy cover and soil moisture characteristics. Under certain circumstances, for short-term recurrence interval forecast and for non-critical application, the analysis of extreme rainfall frequency from less than 20 years data seems justified. Journal of Hydrology, Vol 11, No 1, p 30-46, July 1970. 17 p, 3 fig, 3 tab, 13 ref. OWRR Project A-015-PA.

Descriptors: *Precipitation (Atmospheric), *Synthetic hydrology, *Mathematical models, *Simulated rainfall, Rainfall, Hydrographs, Markov processes, Monte Carlo method, Stochastic processes, Probability, Statistical models, Rainfall intensity, Pennsylvania, Simulation analysis.
Identifiers: Synthetic rainfall series.

An analytical model was developed for the synthesis of seasonal point precipitation at State College, Pennsylvania. This model was based on statistical properties of precipitation events obtained from 27 years of historical data. The means and variances of important precipitation characteristics were reasonably well preserved in the synthesized data. These characteristics include precipitation amounts, precipitation durations, length of dry periods between occurrences of precipitation events, and parameters describing the time patterns of precipitation intensities. The model utilized lognormal and lognormal bivariate distributions of the precipitation characteristics of interest. The lognormal bivariate distributions enabled the preservation of interdependence between selected variables in a Monte Carlo type of generation process. The seasonal cycle in precipitation was defined by subdividing the 365 days of the year into one period of 60 days and five periods of 61 days each, starting at January 1 of each year. The one extra day in leap years was ignored. Time patterns of precipitation intensities were described by the incomplete beta-function. Precipitation events were arbitrarily separated when a period without precipitation lasted for or exceeded 30 min. (Knapp-USGS)

For sale by NTIS as NASA TND 5964, $3.00 in paper copy, $0.95 in microfiche. National Aeronautics and Space Administration Technical Note D-5964, October 1970. 62 p, 20 fig, 2 tab, 24 ref, 3 append.

Descriptors: *Tornadoes, *Vortices, *Equations, *Fluid mechanics, Hydrodynamics, Atmospheric pressure, Winds, Rotational flow, Mathematical models.
Identifiers: Jet stream effects (Atmospheric).

A new equation is derived for the motion of vorticity in a general fluid, including the effects of viscosity, compressibility, nonhomogeneity, and nonconservative forces. The equation holds, in particular, for vortices which may not move with the fluid. A linearized form of this equation is applied to tornado cyclones and to the twin tornado of April 11, 1965, near Elkhart, Indiana. It is shown that the displacement of tornado cyclones to the right of the mean tropospheric winds may be accounted for by the upward efflux of fluid from the cyclone into the jet stream. Also, the retarded revolution rate of the twin tornado may be due in part to an attractive 'buoyancy' force acting on the partially rarefied cores of the pair. (Knapp-USGS)

RIVERS OF DUST.

Chemistry, Vol 42, No 11, p 24, December 1969. p, 1 fig.

Descriptors: *Dust storms, *Air circulation, *Fallout, Eluvium, Weather modification, Cloud seeding, Hurricanes, Atlantic Ocean, Cores, Sediment distribution, Satellites (Artificial), Remote sensing.
Identifiers: *Sahara Desert dust, Ocean sediments.

Red dust originating as dust storms on the Sahara Desert has been found in the atmosphere 3 mi above the Atlantic Ocean. The dust flows west with the trade winds, at a rate of about 15 mi per hour until it reaches the Caribbean near Cuba about 3,000 mi away. There, it splits into three small streams; one crosses Central and South America, another the United States, and the third moves into the north Atlantic. The dust river may influence weather and even play a part in hurricane formation. Discovered accidentally in Barbados in 1965 by British scientists searching for cosmic dust, daily measurements show a peak during the summer when large sand storms are more frequent in the Sahara. Satellite photographs show that it takes about a week for dust to travel from Africa to Barbados. In addition to being useful for tracing atmospheric patterns from satellites, the dust may lead to a better understanding of ocean sediments. Some cores from the Atlantic areas affected by the

dust river have shown material that can be traced to Africa. (Land-USGS)

ATMOSPHERIC AEROSOL: DOES A BACKGROUND LEVEL EXIST,
Washington Univ., Seattle. Dept. of Atmospheric Sciences.
William M. Porch, Robert J. Charlson, and Lawrence F. Radke.
Science, Vol 170, No 3955, p 315-317, October 16, 1970. 3 p, 1 fig, 1 tab, 13 ref.

Descriptors: *Aerosols, *Atmosphere, *Atmospheric physics, Air environment, Light penetration, Instrumentation, Data collections, Remote sensing, Measurement.
Identifiers: *Atmospheric aerosols, *Background level, World climate.

To determine a background level of atmospheric aerosol, for comparison with increases measured in the past 20 years and speculation on the effect of increasing aerosol on World climate, and for use in efforts to control air pollution, measurements of light-scattering were made at Point Barrow, Alaska, and Mount Olympus, Washington. These measurements agree in magnitude, and both sets of data are in agreement with other measurements of light-scattering and turbidity made in remote locations. Results suggest that a background level of aerosol does exist and that the concept of a background is applicable. Background values of the scattering component of the extinction coefficient of air are tabulated for 9 locations. Records are for varying time intervals from 1963 to 1970. The nephelometer was used at 5 of the locations, the Bolz sunphotometer at 3, and a searchlight at the other. (Lang-USGS)

CLOUD SEEDING, AREA OF EFFECT NUMERICAL MODEL,
Aerometric Research, Inc., Goleta, Calif.
Robert D. Elliott.
Report, January 1969, revised. 67 p, 12 tab, 27 fig, 9 ref, 3 append.

Descriptors: *Cloud seeding, *Numerical models, Precipitation (Atmospheric), *Weather modification, Model studies, Weather patterns, Weather forecasting, Storms, Storm structure.

A computerized numerical seeding area of effect model is presented for the orographic winter storm situation. The required inputs are: Vertical profile of wind, temperature, and moisture in the air mass approaching the barrier; The artificial nucleant source strength production curve, and position; Topographic data over the area of interest. Outputs include an outline of the area in which seeding will enhance precipitation. The model handles both the laminar flow and the convection cases. Drift, diffusion, nucleation, growth and fallout from the ground plume is predicted. The model includes a nuclei/water vapor/liquid water/ice/precipitation budget. Growth by both diffusion and accretion is maintained. In the case of convection, growth and fallout of precipitation particles from a tilted convection column to the ground is predicted. A prediction can also be made for an aerial source. Provision is made for reading out in 50-second computational steps the status of all parameters within the ground plume, convection columns, and the fallout therefrom to ground level. The model reproduces results in accord with information gleaned from seeding test projects. It also successfully predicts the temperature dependent division into positive and negative effects found by Grant and Mielke in their statistical analysis of seeding effects in the Rockies.

PROBABLE MAXIMUM PRECIPITATION, MEKONG RIVER BASIN,
Environmental Science Services Administration, Washington, D.C.
John T. Riedel, and Francis K. Schwartz.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Price $1.25. Hydrometeorological Report, No 46, May 1970. 152 p, 60 fig, 71 ref, append.

Descriptors: Design flood, Maximum probable flood, *Precipitation, Spillways, *Probable maximum precipitation, Weather patterns, Storms.
Identifiers: Typhoon rainfall, *Mekong River Basin, Cambodia, Laos, Thailand, Vietnam, China, *Rainfall climatology.

This study is divided into two main parts. The first gives generalized estimates of probable maximum precipitation (PMP) for the Mekong River Basin south of the China border. Drainage areas covered range from 5000 to 25,000 km (2) in size. The prototype to the PMP storm is a typhoon crossing the Vietnam coast into the Mekong River Basin. The second part gives rainfall estimates for calculating the probable maximum flood at three potential dam sites on the Mekong River. These sites and the drainages involved are Luang Prabang, Laos, 262,000 km (2), Pakse, Laos, 539,000 km (2) and Kratie (Sambor) Cambodia, 646,000 km (2). The criteria for these large basins consist of rainfall frequencies over large subareas for the entire southwest monsoon rainy season, and portions thereof, along with rainfall from two critically-spaced typhoons. (Thompson-ESSA)

THE USE OF ENVIRONMENTAL SATELLITE DATA FOR MAPPING ANNUAL SNOW-EXTENT DECREASE IN THE WESTERN UNITED STATES,
Allied Research Associates, Inc., Concord, Mass.
James C. Barnes, and Clinton J. Bowley.
Final report for the Environmental Science Services Administration, June 1970. 105 p, 6 tab, 16 fig, 10 ref, append.

Descriptors: *Snow cover, *Snowmelt, *Snow surveys, *Remote sensing.
Identifiers: Satellite data, Columbia River Basin, Salt River Basin, Southern Sierra Nevada Region.

Techniques to map areal snow extent from satellite photography were tested during the 1967 and 1969 snowmelt seasons in three regions of characteristically different terrain, forest cover, and snowfall climatology in the western United States. Principal data sample used was AVCS photography from ESSA satellites. Also examined were IDCS photographs and Daytime HRIR data from the Nimbus III satellite. Snow-extent measurements from aerial surveys were used as ground-truth data. Results indicate that of the three regions tested satellite imagery provides the most reliable measurements of snow extent in the southern Sierra Nevada in California. For typical river basins in this region, snow extent in terms of percentage of basin covered can be determined to within plus or minus 5% of the aerial-survey measurement. In the Upper Columbia Basin in Idaho and Montana, satellite snow mapping is less reliable because of excessive springtime cloudiness and more densely forested mountain ranges with less horizontal snow-cover extent. In the Salt River Project Area in Arizona shallower snow depths can be mapped because of the sparse vegetation. (Thompson-ESSA)

THE FULL-GLACIAL CLIMATE IN THE SOUTHWESTERN UNITED STATES,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia).
Robert W. Galloway.
Association of American Geographers, Annals, Vol 60, No 2, p 245-256, June 1970. 5 fig, 4 tab, 64 ref.

Descriptors: *Glacial soils, *Playas, *Hydrologic cycle, *Climatic data, *Paleoclimatology, Evaporation, Precipitation (Atmospheric), Runoff, Lakes, Solifluction, Arizona, New Mexico, Arid lands, Temperature, On-site investigations, Southwest U.S., Inflow, Climatology.
Identifiers: *Pluvial climate, *Full-glacial lakes, *Periglacial solifluction deposits, *Lake formation.

Studies on full-glacial closed lakes in the Southwestern U.S. have led to the general conclusion that the last glacial period (23,000-17,000 B.P.) had a generally wet, pluvial climate. Temperatures of the period may be estimated from periglacial solifluction deposits which indicate mean summer temperatures 10 degrees (centigrade) lower than the present arid climate and mean winter temperatures 11 degrees lower. In order to evaluate the significance of this and other full-glacial climatic data in terms of the hydrologic cycle, 8 conservative assumptions were made relating temperature, lake evaporation and inflow, precipitation and runoff. The validity of these assumptions are discussed in terms of existing data. Precipitation on several full-glacial lakes in Arizona and New Mexico was calculated from estimates of evaporation and inflow. It appears that as a result of the prevailing low temperatures, precipitation was somewhat less than present levels, but evaporation was less than one-half, and the large differences between the two led to lake formation. Although the evidence is still inconclusive, it is felt that the theory of pluvial conditions is probably incorrect. (Casey-Arizona)

HEAT AND MASS TRANSFER IN A CHANNEL WITH SURFACE MASS ADDITION: APPLICATION TO PHASE CHANGE PROCESSES,
Minnesota Univ., Minneapolis.
E. M. Sparrow, and H. S. Yu.
AIChE Journal, 16, No 4, 1970, p 588-594. 9 fig, 7 ref.

Descriptors: *Heat transfer, *Mass transfer, Channel flow, Evaporation, Air-water interfaces, Turbulence, Air temperature, Hydraulic water temperature, Thermal properties, Heat budget, Properties, Diffusion properties, Density, Momentum transfer, Reynolds number, Turbulent flow.
Identifiers: Fluid mechanic slushes.

The heat and mass transfer processes in a binary mixture flowing in a parallel plate channel with mass addition at the bounding surfaces are investigated analytically. The rate of mass addition, the temperature, and the mass fraction are arbitrarily prescribed at each of the bounding walls. Similarity solutions are evaluated numerically to yield pressure gradient, Nusselt number, and Sherwood number results for a wide range of each of three governing parameters. Increasingly strong surface mass addition markedly increases the magnitude of the axial pressure gradient. Mass addition decreases the Nusselt and Sherwood numbers at the channel wall at which the injection is strongest but may actually increase these moduli at the opposite wall. A generalizing analysis is performed to accommodate phase change processes as well as to accommodate the specification of plenum conditions rather than wall surface conditions. Application is made to the evaporation of liquid water by air stream. The rate of evaporation is augmented as the rate of air injection increases, but the extent of the augmentation is less than the causative increase in the air flow rate. (Novotny-Vanderbilt)

HYDRODYNAMIC STABILITY OF BOUNDARY LAYERS WITH SURFACE MASS TRANSFER,
Drexel Univ., Philadelphia, Pennsylvania.
F. K. Tsou, and E. M. Sparrow.
Applied Scientific Research, Vol 22, No 314, p 273-286, May 1970. 1 tab, 5 fig, 9 ref.

Descriptors: *Mass transfer, *Heat transfer, *Boundary layers, Air-water interfaces, Evaporation, Energy transfer, Convection, Reynolds number, Laminar flow, Turbulent flow, Turbulence.
Identifiers: Mass transfer theory, Heat transfer theory.

The linear stability of the flat plate boundary layer with surface blowing and suction is investigated by the application of numerical techniques. Complete neutral stability curves, critical Reynolds numbers and wave numbers, and other stability characteristics are determined for a wide range of surface mass transfer intensities. The critical Reynolds number, based on the displacement thickness, is found to vary from 59 to 32500 between the extreme limits of blowing and suction that are investigated. Comparisons are made between the present results and available linear stability information for boundary layers with surface mass transfer and with free-stream pressure gradients. The universal stability bound of Joseph is evaluated and compared with the corresponding numerically exact neutral stability curve. (Novotny-Vanderbilt)

ACTUAL EVAPOTRANSPIRATION AS DETERMINED FROM SOIL-WATER AND CANOPY CHARACTERISTICS AND POTENTIAL EVAPOTRANSPIRATION,
Wisconsin Univ., Madison. Dept. of Soil.
C. B. Tanner, and W. R. Gardner.
Available from NTIS as PB-193 149, $3.00 in paper copy, $0.95 in microfiche. Progress Report, June 1970. 65 p. ESSA Grant E-287-68 (G).
Identifiers: *Evapotranspiration, Predictions, *Plants (Botany), Evapotranspiration, *Soils, Plant tissue, Moisture, Site selection, Water, Vegetables, Energy, Seeds, Atmospheric temperature, Heat flux, Production, Agriculture, Irrigation systems, Stress (Physiology), Plant canopy, Onion plants, Heat budget.

Transpiration and evaporation from a sparsely populated onion field were computed separately from measured evapotranspiration, potential evaporation, stomatal resistances and leaf area indices. Transpiration also was calculated independently from measured stomatal resistance, air vapor pressure, plant-temperature and wind. Daily transpiration estimates found by these two methods agree within 5 percent. The transpiration was only about 25 percent of total evapotranspiration. This field, which was at 1/3-normal population, would transpire at proportionately greater rate if population were increased to normal; however, measurements show that soil evaporation decreases so that evapotranspiration would increase only about 15 percent. The portion of transpiration accounted for by each plant part was 3 percent for umbels, 42 percent for leaves and 55 percent for scapes.

EVAPORATION OF GROUNDWATER FROM COASTAL PLAYAS (SABKHAH) IN THE ARABIAN GULF,
Raikes and Partners, Rome (Italy).
J. G. Pike.
Journal of Hydrology, Vol 11, No 1, p 79-88, July 1970. 10 p, 2 fig, 3 tab, 3 ref.

Descriptors: *Evaporation, *Brines, *Playas, *Deserts, *Groundwater movement, Saline water systems, Water table, Water levels, Salt marshes, Coastal marshes, Evaporation pans.
Identifiers: Sabkhah, Arabian Gulf, Groundwater evaporation.

A sabkhah (plural: sibakh) is a coastal or inland saline mud flat or playa. They are commonly saturated with brine and are often salt encrusted. These sibakh occur in a belt, some 50 km in width, along the southern coast of the Arabian Gulf, extending from Kuwait to the Gulf States. During and after infrequent winter rainfall, these areas may sometimes flood for short periods. Much of the ponded water is lost to evaporation. Many sibakh have shallow water tables at depths of between 0.5 and 1.0 m, and show very little variation with time. A regional groundwater study of the eastern coastal belt of The Gulf suggests that the sibakh complex is either an evaporation sink for rising groundwater or that their water tables are perched. Net radiation, air temperature, vapor pressure, both dry and wet bulb temperatures, surface temperature, and windspeed records were collected. These data were then used to calculate the energy balance. Evaporation is taking place at a constant proportion of the energy income and from a constant depth to water table. Evaporation of groundwater from these sibakh is large and important in an area of limited water resources. (Knapp-USGS)

THE EFFECT OF NITROGEN SUPPLY ON TRANSPIRATION AND STOMATAL BEHAVIOUR OF BEANS (PHASEOLUS VULGARIS L.),
National and Univ. Inst. of Agriculture, Rehovoth (Israel). Volcani Inst. of Agriculture Research.
Daniel Shimshi.
New Phytologist, Vol 69, No 2, p 405-412, April 1970. 1 fig, 2 tab, 8 ref.

Descriptors: *Nitrogen, *Transpiration control, *Soil-water-plant relationships, *Stomata, *Moisture deficit, Leaves, Beans, Laboratory tests, Soil moisture, Plant physiology, Arid lands, Wilting point, Deserts, Moisture stress.
Identifiers: *Nitrogen deficit, Primary leaves, Trifoliate leaves, Desert soils, Seedlings, Negev Desert.

Arid lands are generally characterized by low soil N levels. Potted bean seedlings were grown and maintained in low-N Negev Desert soil and half were fertilized with N. The N-supplied plants exhibited normal leaf habits while only the primary leaves of the N-deficient leaves were green. With high soil moisture (14-20 percent) transpiration rates were highest in N-supplied plants, but on approaching the wilting point (7-10 percent) they dropped below the N-deficient plants. The stomata appeared closed, but coating with vapor-impervious compounds revealed they were open but below microscopic resolution and could be experimentally induced to much greater apertures. Apparently moisture stress occurs even at 17-20 percent soil moisture. When stomata were fully open, apertures were smaller in N-deficient plants but transpiration rates were comparable in all plants at higher levels of plant hydration. It was tentatively concluded that: (1) N-deficient plants cannot achieve normal stomatal openings and (2) The degree of leaf hydration probably effects some control on transpiration rates independently of stomatal control. (Casey-Arizona)
W71-00956

THE EFFECT OF NITROGEN SUPPLY ON SOME INDICES OF PLANT-WATER RELATIONS OF BEANS (PHASEOLUS VULGARIS L.),
National and Univ. Inst. of Agriculture, Rehovoth (Israel). Volcani Inst. of Agriculture Research.
Daniel Shimshi.
New Phytologist, Vol 69, No 2, p 413-424, April 1970. 3 fig, 2 tab, 21 ref.

Descriptors: *Nitrogen, *Transpiration control, *Soil-water-plant relationships, *Stomata, *Moisture deficit, Laboratory tests, Beans, Leaves, Chlorophyll, Electrolytes, Plant physiology, Soil moisture, Wilting.
Identifiers: *Nitrogen deficiency, Primary leaves, Trifoliate leaves, Sap solutes, Seedlings, Sap, Sugar, Desert soils.

In N-supplied single bean seedling leaves chlorophyll content was high and stomatal apertures were wide open while corresponding values for N-deficient leaves were 50 percent or less. A high soil moistures N-supplied trifoliate transpiration rate leaf values were higher than primary leaf values but dropped faster with decreasing soil moisture. In N-deficient plants the situation was reversed and both types of leaf had lower values than N-supplied plants. The differences were ascribable to 3 interacting factors: (1) Soil moisture (2) Leaf age and (3) N-status. Apparently stomata in N-deficient leaves fail to close as tightly as those of N-supplied leaves, accounting for their higher transpiration rates in drier soils. Below 9 percent soil moisture, N-supplied plants exhibited clear wilting symptoms never seen in N-deficient plants. N-supplied plants had consistently higher electrolyte and sap sugar levels in all ranges of soil moisture. Apparently N-deficiency inhibits sap sugar content response to moisture stress onset. Various theories concerning the mechanisms of these effects are discussed and it is concluded that the plant's abilities to regulate stomatal opening and sap-solute concentrations are affected by N deficiency. (Casey-Arizona)

SNOW COVER EVAPORATION IN THE SEMIDESERT ZONE OF KAZAKHSTAN,
S. P. Rylov.

Translation from Trudy KazNIGMI, No 32, p 64-77, 1969. Soviet Hydrology: Selected Papers, Issue No 3, p 258-270, 1969. 13 p, 3 fig, 8 tab, 29 ref.

Descriptors: *Evaporation, *Snow cover, *Foreign projects, Runoff, Vapor pressure, Snowmelt, Soil moisture, Statistical methods, Correlation analysis, Precipitation (Atmospheric), Meteorological data, Air temperature, Humidity, Hydrology, Wind velocity, Topography.
Identifiers: *Semidesert zone, *Kazakhstan (USSR).

Observational data of the West Kazakhstan runoff station for a 14-year period (1952-65) were used to estimate snow evaporation in winter and spring in the semidesert zone of Kazakhstan U.S.S.R. Two types of relationships were constructed on the basis of measurements of snow evaporation and average meteorological elements (temperature, absolute humidity, and vapor pressure deficit). The first of these included the relationship between snow evaporation and air temperature and absolute humidity, and the second was constructed from the relationship between snow evaporation and the vapor pressure deficit. Results indicate the following: (1) the rate of evaporation from snow is 0.09-0.12 in winter and 0.40-0.60 mm/day in spring; (2) the computed evaporation from snow in the December-March period ranges from 15 mm in the north to 25-30mm in the south; (3) the losses in snow storage through evaporation are 15% in winter, and 5% for the nonreduced evaporation depth and 18% for the reduced evaporation depth during the snow melting period; (4) verification of the existing methods of computing evaporation from snow in the semidesert zone of Kazakhstan showed that the most accurate and simple method of computing it is that based on the vapor pressure deficit. THE CENTRAL AUSTRALIAN STREAM FLOODS OF FEBRUARY-MARCH 1967,
Adelaide Univ. (Australia). Dept. of Geology.
George E. Williams.
Journal of Hydrology, Vol 11, No 2, p 185-200, August 1970. 16 p, 6 fig, 4 tab, 11 ref.

Descriptors: *Floods, *Deserts, *Arid lands, *Historic flood, Stage-discharge relations, Hydrologic data, Data collections, Sediment transport, Sedimentary structures, Flood damages, Turbulent flow, Critical flow, Velocity.
Identifiers: *Australia.

Between Feb. 5 and Mar. 8, 1967, central Australia received some of its heaviest rains on record. Derived from three separate southward intrusions of monsoonal weather, the rains gave total gagings of 120-350 mm, with some stations receiving overnight falls of over 150 mm. The ensuing floods were the most devastating in the western Lake Eyre basin in living memory. Accurate hydrological data are available only for the Todd and Finke rivers. During the 1967 floods the Todd attained a maximum gage height of 2.17 m and a mean velocity of 1.95 m/sec; the Finke, a maximum gage height of 6.95 m. Other major streams flooded to depths of 3-5 m and locally spread to widths of several kilometers. On March 15, floodwaters were observed entering Lake Eyre by way of the Macumba and the Neales. Finke waters did not reach Lake Eyre, being absorbed by the sands of the Simpson Desert. Large-scale ripples (dunes) were preserved on most sand-bed channels at the recession of the floods, indicating that subcritical flow prevailed for most streams. By estimating the Froude number and the Darcy-Weisbach resistance coefficient for large-scale ripples, mean stream velocities of about 0.8-2.8 m/sec have been calculated for such chan-

nels. In contrast, flat-bedded sand with parting lineation was deposited in the middle reach of the Finke. It is estimate d that there the Finke attained a mean velocity of about 3 m/sec and a peak discharge of about 1200 cu m/sec. (Knapp-USGS)

STREAMFLOW SYNTHESIS FOR UNGAGED RIVER,
Corps of Engineers, Sacramento, Calif. Hydrologic Engineering Center.
Leo R. Beard.
Tech Paper No 5, The Hydrologic Engineering Center, Corps of Engineers, US Army, Sept-Oct 1967. 14 p, 6 tab, 4 ref.

Descriptors: *Mathematical models, *Simulation analysis, *Streamflow, *Monthly.
Identifiers: Model coefficients.

A mathematical model for simulating monthly streamflow, developed by the Hydrologic Engineering Center of the Corps of Engineers was described Model coefficients for each of the 12 calendar months and number 48 for a single location. For the purpose of deriving a monthly streamflow model for ungaged locations, these coefficients were combined into a small number of generalized coefficients, which can feasibly be related to drainage basin characteristics. Generalized coefficients for simulating monthly streamflows were developed with the requirement that important characteristics of flows generated using the generalized coefficients compared reasonably with those characteristics of recorded data at long-record stations throughout the United States. Means of establishing generalized model coefficients and generating hypothetical streamflows for ungaged locations were described. The generalized model required 4 statistics for use at a single station. These were indexes of wet-season average flow, dry season average flow, flow variation from year to year, and flow persistence from month to month. The statistics represented the important characteristics of streamflow and were designed so that any amount and type of information could be used in their estimation. (Kriss-Cornell)

Tech Paper No 6, The Hydrologic Engineering Center, Corps of Engineers, US Army. 13 p, 5 tab, 4 ref.

Descriptors: *Simulation analysis, *Mathematical modes, *Computer programs, *Markov processes, *Streamflow, Monthly, Stations.

Generation of daily streamflow for a location where daily flow records existed and where monthly total flows for the periods of generation were given was accomplished by two elaborate computer programs usable in high-speed computers. The model described was based on adequate representation of daily streamflow variations at the 7 selected stations listed. Data used for tests of the model were limited to the 7 stations. The procedure was based on generation of monthly streamflows and subsequent allocation of the monthly total amounts to each day. The monthly streamflow generator used was developed in the Hydrologic Engineering Center of the Corps of Engineers and for a single station it consisted of a simple Markov chain, with each flow consisting of a random component and a component correlated with the preceding month's flow. The mathematical model used for daily streamflow simulation consisted of a second order Markov chain, using standardized variates. Results for the 7 stations used were summarized. A summary of the procedure and a test of the over-all results was given. (Kriss-Cornell)

THE MATHEMATICAL SIMULATION OF THE HYDROLOGY OF SMALL WATERSHEDS,
Purdue Univ., Lafayette, Ind. Dept. of Agricultural Engineering.
L. F. Huggins, and E. J. Monke.
Purdue University Water Resources Research Center, Lafayette, Indiana, Tech Rep No 1, Aug 1966. 130 p, 19 fig, 5 tab, 3 append, 52 ref.

Descriptors: *Mathematical models, *Hydrology, *Digital computers, *Hydrographs, *Simulation analysis, Watershed management, Runoff.

A mathematical model which integrated the relationships for various hydrologic components of runoff at all points in a watershed to obtain the runoff hydrograph for a complete area was proposed. The procedure consisted of the development of relationships describing the runoff dynamics for very small elemental areas or points within the watershed. Quantitative relationships were suggested for five of the basic hydrologic components which described the runoff processes: interception, infiltration, depression storage or surface retention, surface detention and surface runoff. A general purpose digital computer program, written in Fortran IV was developed to evaluate the resulting mathematical watershed model. The ability of the proposed watershed model to simulate observed runoff hydrographs from small (two acre) watersheds was investigated for several storm events. The model was capable of simulating complex storm events very satisfactorily. A comparison between the runoff hydrograph predicted for each storm event by the synthetic hydrograph analysis and the proposed model was made. The sensitivity of the predicted hydrographs of selected storm event to changes in the values of the assumed initial parameters was reported. (Kriss-Cornell)

SOME ASPECTS OF THE AVAILABILITY OF WATER FROM THE EVERGLADES TO THE EVERGLADES NATIONAL PARK, FLORIDA,
Geological Survey, Tallahassee, Fla.
J. H. Hartwell.
Geological Survey Open-file Report 70007, September 1970. 36 p, 10 fig, 2 tab, 7 ref.

Descriptors: *Florida, *Water sources, *Swamp, Surface drainage, *Rainfall-runoff relationship, *Depth-area-curves, Surface waters, Streamflow, Canals, Levees, Stream gages, Flow rate, Discharge measurement, Flow characteristic, Water management (Applied), Discharge (Water)
Identifiers: *Everglades, *Everglades National Park (Florida).

Hydrologic information was evaluated to determine the source of water in south Florida that flowed from the north into Everglades National Park. In particular, consideration was given to overland flow of water to the park. A comparison was made of discharges at several locations for two 12-year periods, 1940-51 and 1952-63. The first period was prior to the construction of water control works for the Central and Southern Florida Project. The second period covered the time during which control works were progressively being built. Discharge from Lake Okeechobee to the Everglades was 5.4 million acre-feet for the period 1940-51 and 1.5 million acre-feet during 1952-63. In spite of the reduction in flow from Lake Okeechobee to the Everglades in the second period, the flow to the Everglades National Park into the Shark River Slough was 2.7 million acre-feet greater in the second period than during the first period. An increase in rainfall on Conservation No. 3 in the period 1952-63 probably contributed significantly to the increased discharge to Shark River Slough, but some of the increase in discharge apparently resulted from new control works of the Central and Southern Florida Project, which reduced flow to the sea through the coastal canals. Related maps, graphs, and tables of data are included. (Woodard-USGS)

LOW-FLOW FREQUENCIES OF ILLINOIS STREAMS,
Geological Survey, Washington, DC.
Oscar G. Lara.
Illinois Department Public Works and Building Division of Waterways Report, 1970. 317 p, 11 fig, 6 tab, 11 ref.

Descriptors: *Low flow, *Frequency, *Streamflow, *Illinois, Data collections, Hydrologic data, Frequency analysis, Statistical methods, Streamflow forecasting, Duration curves.
Identifiers: Low-flow frequency.

This report contains low-flow data and regionalized low-flow frequency curves for all areas in Illinois where at least five years of record (through 1965) have been collected. Minimum average flows for periods of 1, 7, 15, 30, 60, 120, and 183 days are tabulated for the benefit of those who are

erested in the amount of flow available in the tream with minor or no storage. Data for 12, 24, nd 60 months are also included in the tables for hose concerned with the minimum expected in- low into large impounding reservoirs. Six separate egionalized frequency curves for each station have een fitted on the plotted data. These curves evalu- te the minimum average flow expected in periods f 7, 15, 30, 60, 120, and 183 days, respectively. A echnique is derived to serve as a guide in fitting requency curves to observed data on a regional- ed basis, and for the purpose of extrapolating hort-term records. This technique is based on rela- ons empirically developed between low-flow and ow-duration parameters. (Woodard-USGS)

/ATER RESOURCES OF THE CENTRAL NEW ORK REGION,
eological Survey, Albany, N.Y.
/illiam G. Weist, Jr., and G. L. Giese.
ew York Water Resources Commission Bulletin 4, 1969. 58 p, 21 fig, 2 plate, 3 tab, 22 ref.

escriptors: *Water resources, *Surface waters, Groundwater, New York, Hydrologic cycle, reamflow, Flow rates, Geology, Geologic forma- ons, Aquifers, Bedrock, Water quality, Water sources development, Regional flood, Ground- ater recharge, Irrigation, Water pollution.
entifiers: Water-related problems, Streamflow xtremes, Available water supply.

his report summarizes the available data on the ater resources of the Central New York Region hich includes Cayuga, Cortland, Madison, Onon- ga, and Oswego Counties--an area of 3,622 uare miles centering around Syracuse. The 0,000 people living in the region use about 310 gd (million gallons per day) of water for domestic d industrial purposes. About 90% of this water esently comes from surface-water sources. The gion includes parts of four major drainage basins: e Mohawk River, the Oswego River, the squehanna River, and the Lake Ontario plains. reamflow in the region is highly variable both om time to time, and from place to place. roundwater in the region occurs in both con- lidated deposits (bedrock) and unconsolidated posits (sand, gravel, etc.). The bedrock can be vided into seven units on the basis of similarity of hology and hydrologic porperties. These units e, in ascending order, lower shale, sandstone, ndstone-shale, dolomite, middle shale, limestone, d upper shale. The best sources of groundwater the region are the unconsolidated deposits of nd and gravel in the major valleys. Maps, graphs, d tables pertinent to the study are included. Woodard-USGS)

VER TIME-OF-TRAVEL AS DETERMINED Y FLUORESCENT DYE MEASUREMENTS ND KINEMATIC WAVE PROCEDURES,
yoming Univ., Laramie. Dept. of Engineering.
erald R. Zimmerman.
S. Thesis, Wyoming University Graduate hool, August 1970. 104 p, 43 fig, 9 tab, 31 ref, pend. OWRR Project A-001-WYO (31).

escriptors: *Streamflow, *Flow rates, *Time, Dye releases, Tracers, Fluorescence, Channel orphology, Discharge measurements, Low flow, e, Maps, Wyoming.
entifiers: *Time-of-travel, *Laramie River /yo), High flow, Ice conditions, Curves.

ree time-of-travel measurements using a orescent dye as a tracer were conducted on a 8-mile reach of the Laramie River in the vicinity Laramie, Wyoming, and one measurement on a 5-mile reach of Nash Fork in the Snowy Range ountains. For the Laramie River the studies were ring relatively high flow, low flow, and ice condi- ns. One of the unique portions of the study was at it was conducted under ice conditions. A arch of the lieterature failed to find a previous study of travel time with ice cover. Because of the added friction at the surface, the time-of-travel under ice was longer than for open water even for a larger discharge. It was determined that the peak travel time could be reproduced by an overlapped dye cloud while the centroid travel times were not consistant. Because of this, the peak travel times were used to define the mean velocity of the river in a test reach. The results from the time-of-travel studies were compared with mathematically routed dye clouds using the continuity and momentum equations. These comparisons were in good agreement. (Woodard-USGS)

WATER RESOURCES OF THE CHAMPLAIN-UPPER HUDSON BASINS IN NEW YORK STATE,
Geological Survey, Albany, N.Y.
G. L. Giese, and W. A. Hobbs, Jr.
New York State Water Resources Commission and Office of Planning Coordination Report, 1970. 153 p, 31 fig, 2 plate, 6 tab, 23 ref, 8 append.

Descriptors: *Water resources, New York, Surface waters, Groundwater, Water quality, Water resources development, Hudson River, Streamflow, Aquifers, Water yield, Water supply, Runoff, Hydrogeology, Data collections, Hydrologic data, Water wells.
Identifiers: Lake Champlain (NY), Hudson River basin (NY).

This report describes the surface- and groundwater resources of the Lake Champlain-Upper Hudson region--a 6,108-square mile area in northeastern New York State. The region is water rich, having an average yearly precipitation of 38 inches. Major rivers include the Saranac, Ausable, Bouquet, Schroon, Sacandaga, and Hudson Rivers. Runoff in streams averages about 1.8 cubic feet per second per square mile but ranges from less than 1.0 to more than 2.0. The valley-fill deposit of the Glens Falls area is the largest groundwater aquifer in the study area. Yields from individual wells in this area average 67 gpm but are as much as 400 gpm from properly constructed wells. The bedrock is most productive where it constitutes an artesian system in the Plattsburgh area. Wells in this system yield an average of 35 gpm and may yield as much as 200 gpm. The chemical quality of the waters is good to excellent. Dissolved solids content, even of the groundwaters, rarely exceeds 500 ppm. In large sections of the Adirondack Mountains underlain by crystalline rocks, dissolved solids content of the groundwaters is less than 100 ppm. The amount of dissolved material in surface waters is even less. High hardness and alkalinity are sometimes found in eastern and northern parts of the area. (Knapp-USGS)

FITZGERALD V FORTIER (LIABILITY FOR OBSTRUCTION OF WATERCOURSES).

198 NE 167-170 (Mass 1935).

Descriptors: *Massachusetts, *Watercourses (Legal), *Obstruction to flow, *Surface drainage, Surface runoff, Culverts, Legal aspects, Judicial decisions, Drainage, Natural flow, Diversion, Channels, Meanders, Beds, Banks, Lakes, Springs, Landfills, Damages.

Plaintiff brought suit against defendant for injunctive relief and damages for defendant's obstruction of a natural watercourse which caused the backing up of water onto plaintiff's land. Plaintiff contended that defendant had filled in his land so that the natural flow of the alleged watercourse was blocked. The prime question was whether the stream of water diverted by defendant onto plaintiff's land was from a natural watercourse or merely surface drainage which ran from defendant's land over the land of plaintiff. The trial court ruled for plaintiff, and the Supreme Judicial Court of Massachusetts affirmed. The court held that the evidence supported the trial court's finding that there was a natural watercourse. Such evidence showed the existence of a natural channel with beds and banks, even though water did not flow on a continual basis. (Duss-Florida)

Identifiers: Streamflow data (Mich.).

Michigan gaging station data of 10 or more years of record and which were not seriously affected by regulation are tabulated. Selected summaries--summaries used most frequently by consultants and water managers--are compiled for this report. For each gaging station the following data are provided: duration table of daily discharge; lowest mean discharge; highest mean discharge; monthly mean discharges; annual mean discharge; and annual peak discharges. For stations having 19 or more years of record duration hydrographs are shown. (Knapp-USGS)

LAND SUBSIDENCE RELATED TO DECLINE OF ARTESIAN HEAD AT BATON ROUGE, LOWER MISSISSIPPI VALLEY, U. S. A.,
Geological Survey, Washington, D. C.
G. H. Davis, and J. R. Rollo.
French resume. In: Land Subsidence, Proceedings Tokyo Symposium - International Association of Scientific Hydrology and UNESCO, September 1969, Vol 1 of 2 Vol, p 174-184, 1970. 11 p, 8 fig, 15 ref.

Descriptors: *Subsidence, *Withdrawal, *Artesian wells, *Louisiana, *Mississippi River Basin, Water levels, Water level fluctuations, Potentiometric level, Confined water, Water utilization, Discharge (Water).
Identifiers: Baton Rouge (La).

Comparison of precise levelling in the Baton Rouge area of the Lower Mississippi Valley indicates as much as 30 cm of subsidence of the land surface during the period 1900-1965. Maximum subsidence is centered in the Baton Rouge industrial district, the area of greatest withdrawals from wells and maximum decline of artesian head. Lines of equal subsidence for the period 1934 to 1965 show a bowl-shaped depression slightly elongated east-west; the 5-cm subsidence line encloses an area of about 250 sq mi. The areal distribution of subsidence corresponds closely with distribution of decline in head in the confined aquifer system. Increases in rate of head decline in heavily pumped zones are reflected in accelerating subsidence. Presumably head decline in the multiple aquifier system of the Baton Rouge area has caused compaction of fine-grained sediments interbedded with and separating the beds of water-bearing sand. Average head decline in the aquifer system in the area of maximum subsidence approximates 200 feet since pumping of confined water began about 1890. The ratio of subsidence to head decline is about 0.5 foot of subsidence for each 100 feet of head decline. Subsidence can be expected to continue with continuing head decline. (Knapp-USGS)

NONUNIQUENESS OF STEADY STATE FINGERING SOLUTIONS IN POROUS MEDIA,
Purdue Univ., Lafayette, Ind.
James E. Varnon, and Robert A. Greenkorn.
Water Resources Research, Vol 6, No 5, p 1411-1414, October 1970. 4 p, 8 ref. ACS-PRF Grant 1797-A2, A6.

Descriptors: *Mathematical studies, *Flow, *Porous media, *Interfaces, Oil-water interfaces, Surfaces, Equations, Boundary processes.
Identifiers: Multiphase flow, Fingering.

Steady state solutions for single viscous fingers in 2-phase flow in porous media are nonunique because the position of the interfacial boundary is not specified. Expanding the steady state problem to include an arbitrary number of fingers does not make the solution unique. The initial value problem however does have a unique solution. This suggests that it is futile to look for additional conservation equations in the hope of making the steady state solutions unique. (Knapp-USGS)
W71-00580

FLUID TRAVEL TIME BETWEEN A RECHARGING AND DISCHARGING WELL PAIR IN AN AQUIFER HAVING A UNIFORM REGIONAL FLOW FIELD,
Geological Survey, Denver, Colo. Water Resources Div.
D. B. Grove, W. A. Beetem, and F. B. Sower.
Water Resources Research, Vol 6, No 5, p 1404-1410, October 1970. 7 p, 5 fig, 1 ref.

Descriptors: *Groundwater movement, *Confined water, *Velocity, *Equations, *Computer programs, Mathematical studies, Aquifers, Artesian wells, Injection wells, Tracers, Path of pollutants, Recharge, Discharge (Water), Flow, Steady flow.
Identifiers: Travel time.

Equations describing steady state flow between a recharging-discharging pair of wells in a confined aquifer which has a uniform regional flow field are used in a computer solution for the travel time of fluid between the wells. The time required for a contaminant or a tracer to travel from the recharging well to the discharging well, and the temporal variation in concentration of the contaminant can be read directly from generalized plots of the computer solution. (Knapp-USGS)

THE EFFECT OF CONTACT POINTS ON SPECIFIC RETENTION OF RUBBLY ROCK PARTICLES,
Khartoum Univ. (Sudan). Dept. of Geology.
Ismail M. El Boushi.
Journal of Hydrology, Vol 11, No 2, p 159-168, August 1970. 10 p, 3 fig, 3 tab, 6 ref.

Descriptors: *Specific retention, *Capillary water, Hydraulic models, Laboratory tests, Porosity, Porous media, Groundwater, Soil water, Permeability, Specific yield, Water storage, Particle size, Gravels.
Identifiers: Water retention (Porous media).

Most of the water of retention of rubbly rock particles is held by contact points in the form of funicular or pendular water bodies. The contact of 38 mm spheres marks the point where the tendency to form funicular water bodies ends and the tendency to form pendular rings starts. Although the particle surface area for sizes below 38 mm is an important factor in controlling water of retention, water held at the contact points is of more importance. (Knapp-USGS)

FACTORS CONTROLLING THE LOCATION OF THE GROUNDWATER DIVIDE IN NORTHERN ISRAEL,
Israel Geological Survey, Jerusalem.
U. Kafri.
Journal of Hydrology, Vol 11, No 1, p 22-29, July 1970. 8 p, 4 fig, 1 tab, 18 ref.

Descriptors: *Groundwater movement, *Groundwater basins, *Hydrogeology, *Carbonate rocks, Recharge, Discharge (Water), Water levels, Water level fluctuations, Geohydrologic units, Water yield, Water resources development.
Identifiers: Israel.

The location and formation of the regional groundwater divide in the Cenomanian-Turonian carbonate aquifer of Galilee, which today is situated west of the structural axial region, is controlled by two factors: 1, the shifting of the ancient groundwater divide from the structural axis zone westward, due to tectonic movements and formation of new base levels since the Neogene; 2, facies changes within the carbonate aquifer and differences in permeability between its lower and upper subaquifers. As a result, an upconing of the water table may occur during the process of natural recharge, and thus, regional or local groundwater divides may be formed. (Knapp-USGS)

GEOLOGY AND GROUNDWATER RESOURCES OF NEW HANOVER COUNTY, NORTH CAROLINA,
Geological Survey, Raleigh, N.C.
George L. Bain.
North Carolina Division of Groundwater Bulletin No 17, April 1970. 79 p, 22 fig, 5 tab, 21 ref.

Descriptors: *Hydrogeology, *Aquifers, *Water resources development, *North Carolina, Groundwater, Water resources, Water quality, Water wells, Artesian wells, Water yield, Transmissivity, Withdrawal, Water supply, Water levels, Data collections, Hydrologic data.
Identifiers: New Hanover County (NC).

This report describes the groundwater resources of New Hanover County in southeastern North Carolina. The county is a part of the Atlantic Coastal Plain Province and occupies a peninsula between the Atlantic Ocean and the Cape Fear and Northeast Cape Fear Rivers. The climate is humid; the average annual precipitation is about 50 inches. Groundwater occurs in a system of slightly inclined formations underlying the Coastal Plain. Maximum thickness in New Hanover County is slightly more than 1,500 feet. Most of the formations are composed of unconsolidated sands and clays containing a few beds of limestone and calcareous sandstone. The volume of water stored in the Coastal Plain formations in New Hanover County is large; however, water in all but the shallow formations is too salty for most uses. Water of acceptable chemical quality for most purposes is available throughout the county, but a wide range in quality of water within the aquifers is common. The current withdrawal of groundwater is only a small part of the available supply. (Knapp-USGS)

dy made with funds administered by US Army ps of Engineers. Geological Survey Open-file ort, 1970. 76 p, 22 fig, 6 tab, 37 ref.

criptors: *Water resources, Michigan, oundwater, *Aquifers, Water resources elopment, Hydrologic data, Data collections, drogeology, Water quality, Water yield.
ntifiers: Grand River basin (Mich).

principal aquifers in the Grand River basin, higan include beds of sand and gravel of glacial in and bedrock formations of sandstone and estone. As these aquifers vary considerably in meability from one area to another, maximum yields range from less than 10 gpm to more 1000 gpm. Large yields generally can be ob-ed from wells adjacent to streams where the ifers are recharged by the streams. Most of the er obtained from wells is hard to very hard, and ch of it contains objectionable concentrations of . Most water can be made satisfactory for rly all uses with commonly-used water treat-t processes and equipment. Saline water is sent at depth throughout the basin, and in some lities, saline water is at relatively shallow depth. groundwater reservoirs, although extensively zed at the present, have considerable potential additional development. Research Inst. for Water Resources Development, Budapest (Hungary).
J. Galfi, and M. Palos.
Bulletin International Association of Scientific Hydrology, Vol 15, No 3, p 41-46, September 1970. 6 p, 6 fig.

Descriptors: *Groundwater, *Water table, *Seismic studies, *Exploration, Locating, Seismographs, Instrumentation, Sounding, SUBSURFACE INVESTIGATIONS, Sands, Aquifers.
Identifiers: Groundwater prospecting.

In sandy areas the groundwater level can be revealed by seismic refraction measurements. In arenaceous grounds the groundwater level shows a characteristic sudden velocity increase; the groundwater table is in general a refracting boundary. The propagation velocity of compressional seismic waves in the dry sands overlying the groundwater level is 200-350 m/s in general, while in the saturated, wet sands the characteristic value is 1200-1500 m/s. At the groundwater level the acoustic inpedance shows a significant jump, which is partly due to the increase in velocity, and partly to the difference in density. The high increase in impedance accounts for the observed very low energy of waves refracted on the groundwater table. (Knapp-USGS)

THE POISEUILLE ANALOGUE FOR FLOW OF WATER IN WYOMING BENTONITE,
Commonwealth Scientific and Industrial Research Organization, Griffith (Australia). Div. of Soils.
A. V. Blackmore.
Journal of Hydrology, Vol 11, No 1, p 59-68, July 1970. 10 p, 2 fig, 1 tab, 22 ref.

Descriptors: *Groundwater movement, *Bentonite, *Hydraulic gradient, Darcys law, Hydrostatic pressure, Porosity, Ion transport, Clays, Porous media, Ion exchange, Membrane processes, Viscosity, Osmosis.
Identifiers: Poiseuille flow.

Water movement, parallel to the plane of orientation, is measured in a Wyoming bentonite as a function of hydrostatic pressure gradient and interparticle spacing; a simple system and technique are used so that some of the difficulties normally associated with the movement of water through reactive materials are avoided. The data are interpreted with the object of establishing a mathematical model based on the slit analogue of the Poiseuille equation, modified for electro-osmosis and anomalous viscosity, as suggested by Kemper. Pore velocity, at constant spacing, is very nearly proportional to pressure gradient (Darcy's law) while at constant pressure gradient it is linearly related to the square of the spacing. When the implications of these results are applied to the analogue an expression is obtained that describes the flow in a satisfactory manner. This expression is compared with one developed for flow in inert materials both within and beyond the limits of the present experiment. (Knapp-USGS)

North Carolina Department of Water Resources Ground Water Bulletin No 16, April 1970. 127 p, 14 fig, 28 tab, 29 ref.

Descriptors: *Hydrogeology, *Groundwater, *Aquifers, North Carolina, Water wells, Water supply, Water quality, Water yield, Geology, Water levels, Data collections, Hydrologic data.
Identifiers: Asheville (NC), Madison County (NC), Buncombe County (NC), Henderson County (NC), Transylvania County (NC).

The Asheville area, comprising Madison, Buncombe, Henderson, and Transylvania Counties, covers 1,860 square miles entirely within the Blue Ridge province in western North Carolina. Springs are the most important source of water in northwestern Madison County for homes, small communities, schools, and other institutions. Dug wells are of some importance as a source of groundwater, whereas bored wells are comparatively rare. The average drilled well in the area is 120 feet deep and has a reported yield of about 15 gallons per minute. Generally, the groundwater is slightly acid, contains less than 100 ppm dissolved solids, and is soft. Dug wells are considerably more susceptible to contamination than springs or drilled wells. Groundwater types can be mapped but are shown to extend across, and change within, boundaries of rock units. Thermal springs occur at Hot Springs in Madison County. The thermal water has a calcium sulfate composition, more than three times the dissolved solids of other groundwater in the Asheville area, and temperatures greater than 100 deg F. (Knapp-USGS)

MULTIVARIATE ANALYSIS IN GROUNDWATER HYDROLOGY -- THEORY,
California State Coll., Long Beach. Dept. of Civil Engineering.
A. Eshett.
Water Resources Bulletin, Vol 6, No 5, p 821-825, September-October 1970. 5 p.

Descriptors: *Mathematical models, *Groundwater movement, *Recharge, *Aquifers, Water resources development, Data processing, Statistical models, Statistical methods, Hydrogeology, Correlation analysis, Systems analysis, Linear programming.
Identifiers: Multivariate analysis.

A practical model was developed for the unique determination of the recharge into an aquifer system. The analysis is used to estimate the coefficients of the linear relationship which represent the effective contributions into a groundwater system. The model may be used for the analysis of historic and observed data. The estimates of the procedure are unbiased and consistent, and the statistical model has a good asymptotic efficiency. The application of the statistical analysis to a field situation can be readily carried out. The determination of the effective recharge for distinct hydrologic elements should enable the hydrologist to compute the aquifer response and match it with corresponding historic data. (Knapp-USGS)

2G. Water in Soils

EQUATIONS FOR APPROXIMATING VERTICAL NONSTEADY-STATE DRAINAGE OF SOIL COLUMNS,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
Ray D. Jackson, and Frank D. Whisler.
Soil Science Society of America Proceedings, Vol 34, No 5, p 715-718, September-October 1970. 4 p, 5 fig, 1 tab, 13 ref.

Descriptors: *Soil water movement, *Drainage, *Unsteady flow, Hydraulic conductivity, Capillary action, Mathematical models, Equations, Simulation analysis, Unsaturated flow.
Identifiers: Soil drainage.

Equations are derived, from a capillary tube model, that predict vertical nonsteady-state drainage from soil columns over the entire time of drainage for which experimental data are available. The model assumes that a soil column is a bundle of capillaries of various radii with the effective conductivity of the column decreasing as drainage progresses. The conductivity is first considered to be a linear function of the average water level in the column, and then considered to be a quadratic function of the water level. Both resulting equations predict drainage reasonably well when particular values are assigned to the ratio of the average height of capillary rise to the column length. A simplified expression is obtained by neglecting an insignificant term and assigning values to constants in the equation in which the conductivity was taken as a quadratic function of the average water level. The equations are compared with experimental data. (Knapp-USGS)

EFFECTS OF STEMFLOW WATER ON A MIAMI SOIL UNDER A BEECH TREE: I. MORPHOLOGICAL AND PHYSICAL PROPERTIES,
Ohio Agricultural Research and Development Center, Wooster.
P. L. Gersper, and N. Holowaychuk.
Soil Science Society of America Proceedings, Vol 34, No 5, p 779-786, September-October 1970. 8 p, 8 fig, 3 tab, 16 ref.

Descriptors: *Stemflow, *Soil-water-plant relationships, *Soil formation, *Soil horizons, Soil chemistry, Soil texture, Soil water movement, WATER CHEMISTRY.
Identifiers: Beech trees.

The effects of the stemflow portion of the biohydrologic soil-forming factor on the physical properties of a Miami soil under a beech tree were determined by comparing properties of soil profiles located at different distances from the tree stem. The most obvious effects of stemflow water are a thickening of the A2 horizon, considerable low-chroma mottling in the B horizon, and an increase in the number of subdivisions of the B horizon. Bulk density of the A1 horizon was lowered considerably. Clay content of the A horizon was increased while the content of the B2 horizon was decreased. Correspondingly, the silt content of the A horizon was decreased while the content of the B2 horizon was increased. (Knapp-USGS)

EFFECTS OF STEMFLOW WATER ON A MIAMI SOIL UNDER A BEECH TREE: II. CHEMICAL PROPERTIES,
Ohio Agricultural Research and Development Center, Wooster.
P. L. Gersper, and N. Holowaychuk.
Soil Science Society of America Proceedings, Vol 34, No 5, p 786-794, September-October 1970. 9 p, 11 fig, 3 tab, 30 ref.

Descriptors: *Stemflow, *Soil-water-plant relationships, *Soil chemical properties, Soil formation, Soil physical properties, Soil structure, Soil horizons, Soil chemistry, Soil texture, Soil water movement, Water chemistry.
Identifiers: Beech trees.

The stemflow component of the biohydrologic soil-forming factor caused a much wetter environment, of highly enriched water, in a Miami soil contiguous to a beech tree stem than that prevailing in this soil farther from the stem. This markedly affected the soil such that in A horizons there were progressive increased inward toward the stem in organic C, total N, exch. acidity, exch. K, CEC, and free Fe2 03; and progressive inward decreases in pH, exch. Ca, exch. Mg, and base saturation. In B horizons there were progressive inward decreases in pH, exch. Ca, exch. Mg, exch. K, CEC, base saturation, and free Fe2 03. (Knapp-USGS)

STEADY INFILTRATION FROM LINE SOURCES AND FURROWS,
Agricultural Research Service, Madison, Wis., and Wisconsin Univ., Madison. Coll. of Agriculture.
P. A. C. Raats.
Soil Science Society of America Proceedings, Vol 34, No 5, p 709-714, September-October 1970. 6 p, 5 fig, 22 ref.

Descriptors: *Furrow irrigation, *Infiltration, *Unsaturated flow, *Leaching, Soil water movement, Irrigation design, Irrigation efficiency, Flow, Irrigation systems, Hydraulic conductivity, Equations, Steady flow, Unsteady flow.
Identifiers: Stream function, Partly saturated flow.

Steady infiltration from an array of equally spaced line sources or furrows at the surface of a semi-infinite soil profile is analyzed, based on the assumption that the hydraulic conductivity is an exponential function of the pressure head. Under this assumption, the matric flux potential and the stream function for plane flows satisfy the same linear partial differential equation. Explicit expressions for the stream function, the flux, the matric flux potential, the pressure head, and the total head are obtained. Some implications with regard to furrow irrigation are discussed. The solution provides a rational basis for the discussion of leaching under furrow irrigation. (Knapp-USGS)

SOIL-WATER SAMPLING USING PAN AN DEEP PRESSURE-VACUUM LYSIMETERS,
Pennsylvania State Univ., University Park. Miner Conservation Section; and Water and A Resources Commission, Dover, Del.
Richard R. Parizek, and Burke E. Lane.
Journal of Hydrology, Vol 11, No 1, p 1-21, Ju 1970. 21 p, 8 fig, 1 tab, 14 ref.

Descriptors: *Lysimeters, *Soil water, *Samplin Monitoring, Irrigation water, Soil water movemer Percolation, Infiltration, Water balance, Pennsy vania, Instrumentation, Leaching, Path of poll tants, Landfills, Water quality.
Identifiers: Suction lysimeters.

Two soil-water sampling devices and succe achieved in obtaining soil water on a routine ba at depths of 1 to 36 feet below land surface a described. In one facility, metal pans with copp spounts are driven into the wall of an open tren to intercept gravitational water to a depth of feet. From 4 to 6 inches of water are irrigated a jacent to the trench on a weekly basis. The de trench lysimeter provides gravitational water sa ples on a routine basis when waters are artificia applied to the site but failed to yield samples duri the growing season in the absence of irrigati under Pennsylvania's climate. A modified versi of a commercially available lysimeter can extra soil water under tension from depths in excess of feet. This improved soil-water sampler has be named a pressure-vacuum lysimeter or 'sucti lysimeter'. One or more lysimeters may be install in a 6-inch diameter drill hole. The ceramic tip embedded in a pulverized silica deposit to insu hydraulic continuity with the soil-water reservo When sufficient soil-moisture is available 500 970 mls of water may be obtained on a weekly b sis. During prolonged dry periods, no samples c be collected when soil water has been deplet around the ceramic point. This may be 4 to 8 wee after pan lysimeters fail to yield water samples. (napp-USGS)

THE MOISTURE REGIMES OF SOI DEVELOPED ON KEUPER MARL,
Soil Survey of England and Wales.
A. J. Thomasson, and J. D. Robson.
Journal of Soil Science, Vol 18, No 2, p 329-3 September 1967. 12 p, 4 fig, 5 tab, 20 ref.

Descriptors: *Soil moisture, *Regime, Foreign p jects, Moisture content, Soil profiles, Poros Precipitation (Atmospheric), Water levels.

lentifiers: Moisture release, Subsoiling effects.

he moisture regimes of several representative rofiles of the Worcester series developed on euper Marl in England and Wales are described nd interpreted using a simple field technique sup- emented by determinations of pore space, oisture content, and moisture release charac- ristics. It is suggested that the textural B horizon coarse blocky structure is the cause of water- gging which occurs seasonally in the upper 61 cm these soils. The C horizon, which has a fine ocky structure and a lower clay content, is more rmeable, and determinations of pore space and oisture content showed an appreciable volume of voids in it when the overlying horizons were lly saturated with water. After subsoiling to a pth of 76 cm at one site, the soil was waterlogged s often and then only for shorter periods than rmerly. (Woodard-USGS)

ntifiers: *Lovegrass, *Australia, *Depth to ter.

eld studies of lovegrass (Eragrostis curvula chrad.) Nees) were undertaken in the deep ndy soils of Western Australia in an effort to cover how soil properties affect the annual grass ld. Sites were tested for a water table down to m. On those plots which had a water table there s a close relationship between annual yield and two following properties: depth to the water le and silt and clay content in the 30-60 cm soil er. This relationship, maintained through the rs and over a range of nutrition levels, ac- unted for 87% of the between-site variation in ld. At sites without a water table there was a h negative correlation (PS0.001) between the vival rate of the grass and the coarse sand con- t of the soil profile. Soil mechanical composition s the most important determinant of yield. In mmary, strong associations between yield, chanical composition, and depth to water sug- ted that soil moisture status exerted the greatest trol on growth of grass. (Carr-Arizona)

ANT DESICCATION CRACKS IN CENTRAL UTH DAKOTA SOILS,
ith Dakota State Univ., Brookings.
M. White.
l Science, Vol 110, No 1, p 71-73, July 1970. 2 6 ref.

escriptors: *Cracks, *Sinks, *South Dakota, il moisture, *Soil environment, Alfalfa, Soil er, Soil-water-plant relationships, Semiarid cli- tes, Soil types, Clays, Silts, Soil surfaces.
ntifiers: *Desiccation cracks, *Prisms.

kholes in central South Dakota occur when 20 30 cm wide subsoil desiccation cracks extend ward to the surface. Surface soil collapsing into cracks forms holes which are 1 to 3 m wide and o 3 m deep. A desiccation and contraction cess takes place in the clay and silty soils as ll prisms give way to large prisms. In humid as the subsoil remains moist and in arid areas subsoil is already dry, so that subsoil cracks sel- n occur in these regions. It appears that desicca- n cracks are confined to semiarid areas. Since al- a has perennial roots that can dry the soil to great depth and since sinkholes are most common in 5 to 10 year old alfalfa fields, indications are that water consumption and evapotranspiration by alfalfa cause subsoil desiccation. SOIL MOISTURE EFFECTS ON COMPETITIVE ABILITY OF WEEDS,
Southwestern Great Plains Research Center, Bushland, Tex.
Allen F. Wiese, and C. Wendell Vandiver.
Weed Science, Vol 18, No 4, p 518-519, July 1970. 3 fig, 9 ref.

Descriptors: *Weeds, *Competition, *Plant growth, *Dry farming, *Soil moisture, Soil water, Weed control, Wilting, Corn (Field), Sorghum, Agronomy, Arid lands, Semiarid climates, Irrigation, Drying, Wetting, Grasses, Soil-water-plant relationships.
Identifiers: *Russian thistle, *Irrigated agriculture, Dry matter.

Ten species of plants were grown in competition with each other at wet, medium, and dry soil moisture levels in a greenhouse. Corn (Zea mays L.), barnyardgrass (Echinochloa crusgalli (L.) Beauv.), cocklebur (Xanthium pensylvanicum Wallr.), large crabgrass (Digitaria sanguinalis (L.) Scop.), and sorghum (Sorghum vulgare L., var. RS 626) produced the most dry matter when growing in wet soil. These species showed a great reduction in growth on dry soil. Palmer amaranth (Amaranthus palmeri S. Wats.) grew moderately well on wet and medium soil, but less well on dry soil. Even though kochia (Kochia scoparia (L.) Schrad.), Russian thistle (Salsola kali L., var. tenuifolia Tausch), buffalobur (Solanum rostratum Dunal.), and tumblegrass (Schedonnardus paniculatus (Nutt.) Trel.) produced less dry matter than the other species under wet conditions, their growth was not reduced in dry soil. In fact, kochia and Russian thistle produced their greatest amount of dry matter under dry conditions. These results show that soil moisture conditions greatly affect the competitive ability of the weeds. This should partially explain why kochia, Russian thistle, buffalobur, and tumblegrass are problems in dryland farming in arid and semiarid areas, while barnyardgrass, cocklebur, and large crabgrass are pests on irrigated farms. (Carr-Arizona)

CLAY WATER INTERACTIONS. AN EXPERIMENTAL STUDY OF INTERFACE PHENOMENA,
Royal Inst. of Tech., Stockholm (Sweden). Nuclear Magnetic Resonance Group.
E. Froslind, and A. Jacobsson.
Available from NTIS as AD-710 418, $3.00 in paper copy, $0.95 in microfiche. Final Technical Report, May 1970. 55 p.

Descriptors: *Nuclear magnetic resonance, Montmorillonite, *Montmorillonite, Surface properties, Water, Adsorption, Colloids, Interfaces, Dielectric properties, Crystal structure, Sweden, *Surface chemistry, *Hectorite, Mineral.

The structural properties of water adsorbed on hydrophilic intercrystalline clay mineral surfaces have been investigated by way of NMR and dielectric measuring techniques. It is shown that structural ordering of the adsorbed water layers occurs, that the adsorption takes place independent at the exchange cations present in the intercrystalline spaces and that these ions only modify the structural and relaxation properties of the water. The conventional hypotheses regarding the origin of the hydrophilic clay properties are shown to be untenable.

THROUGHFLOW ON HILLSLOPES AND ITS RELATION TO THE STREAM HYDROGRAPH,
Bristol Univ. (England).
D. R. Weyman.
Bulletin International Association of Scientific Hydrology, Vol 15, No 3, p 25-33, September 1970. 9 p, 3 fig, 11 ref.

Descriptors: *Rainfall-runoff relationships, *Storm runoff, *Surface-groundwater relationships, *Subsurface runoff, *Soil water movement, Hydrograph analysis, Subsurface drainage, Percolating water, Base flow, Hydrographs, Overland flow, Flood forecasting.
Identifiers: Throughflow.

Throughflow was measured from three soil horizons on a 12 deg slope. Storm flow comes from the 10-45 cm horizon and is controlled by the upslope extent of saturated conditions. Base flow comes from the 45-75 cm horizon and is supplied by slow unsaturated flow from the whole soil mass to a small constant zone of saturation. Differences between input and output stream hydrographs over 270 m of channel are attributed to throughflow and correlate well with measured values providing a basis for separating throughflow components from the stream hydrograph. Observed stream flows contain no overland flow or groundwater flow components. The main basin flood peak is not generated within this control section of channel but is produced in the headwater zone by the faster runoff characteristics of the soils in that area and by topographic factors which lead to rapid channel extension. (Knapp-USGS)

RESPONSE UNITS FOR EVALUATING THE HYDROLOGIC PERFORMANCE OF RANGELAND WATERSHEDS,
Agricultural Research Service, Boise, Idaho. Northwest Watershed Research Center.
C. B. England, and G. R. Stephenson.
Journal of Hydrology, Vol 11, No 1, p 89-97, July 1970. 9 p, 1 fig, 2 tab, 14 ref.

Descriptors: *Infiltration, *Rainfall-runoff relationships, *Soil water movement, Soil texture, Simulated rainfall, Rainfall simulators, Mathematical models, Storage capacity, Water storage, Permeability, Grasslands, Soil conservation, Water conservation, Hydrograph analysis, Systems analysis.
Identifiers: Rangelands.

A technique is presented for isolating areas within rangeland watersheds which are homogeneous enough in hydrologic characteristics to permit their use as field experimental units or as computational units in hydrograph synthesis. A study of the interactions among geology, soils, topography, and climate on the 90-square mile Reynolds Creek Experimental Watershed, Idaho, revealed predictable relations among these features and the capacity of a given unit of landscape to retain precipitation. The range site concept incorporates similar considerations and may be used in deriving hydrologic units for synthesizing the hydrology of ungaged areas. (Knapp-USGS)

RELATION OF SOIL HYDRAULIC CONDUCTIVITY TO EXCHANGEABLE CATIONS AND SALINITY,
New Mexico State Univ., University Park. Dept. of Agronomy.
Hessam Mojallali, and H. E. Dregne.
New Mexico State University Agricultural Experiment Station Bulletin 540, November 1968. 11 p, 3 fig, 2 tab, 16 ref.

Descriptors: *Hydraulic conductivity, *Soil water movement, *Ion exchange, *Adsorption, *Soil

chemistry, Soil chemical properties, Soil physical properties, Chlorides, Sodium, Potassium, Ammonia, Calcium, Magnesium, Leaching.
Identifiers: Soil salinity effects.

Leaching experiments on a calcareous Berino sandy loam subsoil showed that soils saturated with exchangeable sodium, potassium, and ammonium became completely impermeable when leached with distilled water. Hydraulic conductivity decreased slightly on soils leached with distilled water after saturation with exchangeable calcium and magnesium. Continued leaching over a six-week period with 5-percent solutions of chloride salts produced a gradual decrease in soil conductivity with sodium and magnesium, but no change with potassium and calcium. Resin column hydraulic conductivity varied with the type of chloride salt used even when the electrical conductivity of the chloride solutions was the same. Hydraulic conductivity decreased in the order of potassium, sodium, calcium, and magnesium, just as in the high salt soil column treatments. Soil hydraulic conductivity is a function of both the elctrical conductivity and the kind of cation of the leaching water. (Knapp-USGS)

THE RELATIONSHIP BETWEEN HEAT TREATMENT AND WATER REPELLENCY IN SOILS,
Forest Service (USDA), Glendora, Calif. Pacific Southwest Forest and Range Experiment Station.
L. F. DeBano.
In: Symposium on Water-Repellent Soils, Proceedings, University of California, Riverside, May 6-10, 1968, Pub March 1969, p 265-279. 4 fig, 2 tab, 4 ref.

Descriptors: *Soil sealants, *Wettability, *Burning, *Chaparral, *Soil water movement, Volatility, Heat treatment, Soil physical properties, On-site investigations, Laboratory tests, Semiarid climates, Convection, Condensation, Soil temperature, Soil texture, Soil investigations, Soil structure, California, Watersheds (Basins).
Identifiers: *Water-repellent soils, Litter, Vaporization.

Samples of water-repellent soils from a burned-over chaparral area were heated in a muffle furnace over temperature ranges of 300-900 degrees fahrenheit (F). Burning times varied in separate samples over 5-20 minutes. From 300-800 F, water-repellency increased with temperature and teatment time, and decreased over 800 F. Calculations of soil temperatures at various depths as a function of surface temperature indicate that the intensification of repellency in situ is unlikely and that volatilization, convection and condensation of hot gases may be occurring. Two subsequent experiments were performed: (1) A 2-inch layer of water-repellent soil was placed over wettable sand and the surface was heated to 1400 F and (2) A 1-1/2 inch layer of undecomposed litter was placed over wettable sand and surface heated until the 3-inch depth reach 200 F. In both cases hydrophobic layers moved down through the soil to deeper depths. These results are similar to recent observations in burned-over areas. Probably the downward movements of volatilized hydrophobic substances are affected by soil texture as well as surface temperature. (Casey-Arizona)

FACTORS RESPONSIBLE FOR WATER REPELLENCE OF SOILS,
Commonwealth Scientific and Industrial Research Organization, Glen Osmond (Australia).
R. D. Bond.
In: Symposium on Water-Repellent Soils, Proceedings, University of California, Riverside, May 6-10, 1968, Pub March 1969, p 259-264. 1 fig, 11 ref.

Descriptors: *Soil fungi, *Soil water movement, *Soil sealants, Soil environment, Soil microbiology, Soil moisture, Semiarid climates, Arid lands, On-site investigations, Soil investigations, Shrubs, Acids, Fungi, Infiltration, Sands, Seasonal, Variability.
Identifiers: *Water-repellent soils, *Australia.

Observations made on a variety of Australian soils showed a close correlation between the presence of fungi and soil water repellence. Occurrance of specific fungal species seems to be dependent on specific shrub species. It is felt that such associations may explain variations of water repellency beneath differing plant communities. Extraction of water-repellent soils with nonpolar compounds left repellency unaltered, but extraction with acids considerably reduced it. Seasonal variations in water repellency occur in Mediteranean-type climates in South Australia. The greatest levels existed in the autumn after onset of rains and lowest levels took place in the dry summer. (Casey-Arizona)

CONTRIBUTION OF SOME SOIL FUNGI TO WATER REPELLENCY IN SOIL MATERIALS,
California Univ., Riverside. Dept. of Soils and Plant Nutrition.
S. M. Savage.
Supported by U.S. Department of Agriculture, Forest Service Grant No. 4000. In: Symposium on Water-Repellent Soils, Proceedings, University of California, Riverside, May 6-10, 1968, Pub March 1969, p 241-257. 5 fig, 3 tab, 16 ref.

Descriptors: *Soil sealants, *Wettability, *Soil physical properties, *Soil fungi, *Soil texture, Soil water movement, Chaparral, Soil temperature, Clays, Sands, Laboratory tests, Soil structure, Soil investigations, Repellents, Fungi, California, Organic matter, Heating.
Identifiers: *Water-repellent soils.

Eight different fungal species were collected and isolated from water-repellent soils of California chaparral areas and injected into sterilized quartz sand with nutrient media. Each culture was incubated for 7, 17, 33 and 53 days. Water repellency appeared, slightly, only in cultures of Penecillium nigricans and Aspergillus sydowi. When the 53-day cultures were heated from 200-400 degrees centigrade, all demonstrated water repellency which decreased with increasing temperature. Solvent extraction indicated that the repellency substances were polar in nature and chemically altered by heating. Cultures of A. sydowi and P. nigricans were initiated in sand-clay mixtures. Results with A. sydowi were: (1) An extremely high repellency occurred in 1 percent clay which decreased with increasing clay percentages and, (2) The sand-clay cultures contained almost twice as much organic matter as the pure sand cultures. By contrast, the wettability of the P. nigricans cultures increased in sand-clay mixtures. The implications of these results are discussed in this paper. It is felt that natural soil-water repellency is probably a product of microbial action. (Casey-Arizona)

THE GRAVIMETRIC METHOD OF SOIL MOISTURE DETERMINATION, PART I - A STUDY OF EQUIPMENT, AND METHODOLOGICAL PROBLEMS,
South Pacific Regional Coll. of Tropical Agriculture, Alafua (Western Samoa).
S. G. Reynolds.
Journal of Hydrology, Vol 11, No 3, p 258-273, September 1970. 16 p, 1 fig, 6 tab, 28 ref.

Descriptors: *Gravimetry, *Soil moisture, *Sampling, *Laboratory tests, Gravimetric analysis, Soil moisture meters, Moisture content, On-site tests, Analytical techniques, Cores, Soil analysis, Test procedures.
Identifiers: Soil moisture analysis.

The type of sampling device, whether a screw or coring auger, is shown to influence soil moisture determinations. Moisture losses after storage of samples in glass tubes or aluminum foil for periods up to 7 days are shown to be negligible. Aluminum foil is recommended as a very inexpensive and efficient container. As the rate and length of drying needed for different soils is quite variable, preliminary investigations should be undertaken to establish the times after which negligible losses occur for further periods of drying. In most field studies samples of 50-100 q of soil are adequate; larger samples of 500 q require much longer periods of drying but give similar results. Methodological problems discussed include the site destruction caused by the gravimetric method and the fact that the method itself accounts for some of the variability found in soil moisture distribution and possibly for supposedly significant changes in soil moisture content in time and space. (See also W71-01065) (Knapp-USGS)
W71-01064

THE GRAVIMETRIC METHOD OF SOIL MOISTURE DETERMINATION, PART II - TYPICAL REQUIRED SAMPLE SIZES AND METHODS OF REDUCING VARIABILITY,
South Pacific Regional Coll. of Tropical Agriculture, Alafua (Western Samoa).
S. G. Reynolds.
Journal of Hydrology, Vol 11, No 3, p 274-287, September 1970. 14 p, 1 fig, 5 tab, 24 ref.

Descriptors: *Gravimetry, *Sampling, *Soil moisture, Laboratory tests, Gravimetric analysis, Soil moisture meters, Moisture content, Analytical techniques, Cores, Soil analysis, Test procedures.
Identifiers: Soil moisture analysis.

The variability of soil moisture in the 0-8 cm horizon was studied over a range of soil types. Typical sample sizes required to estimate the true mean within variability limits of 10%, 5% and 2% are discussed. The magnitude of variability is shown to vary greatly from area to area, depending in particular upon the stoniness and nature of the soil and the type and extent of the vegetation cover. Three methods which might reduce sample size are the use of the gravimetric volume basis method instead of the weight basis method, removal of surface vegetation, and removal of stones and rhizomes from samples. (See also W71-01066) (Knapp-USGS)

THE GRAVIMETRIC METHOD OF SOIL MOISTURE DETERMINATION, PART III - EXAMINATION OF FACTORS INFLUENCING SOIL MOISTURE VARIABILITY,
South Pacific Regional College of Tropical Agriculture, Alafua (Western Samoa).
S. G. Reynolds.
Journal of Hydrology, Vol 11, No 3, p 288-3, September 1970. 13 p, 4 fig, 4 tab.

Descriptors: *Soil moisture, *Vegetation effects, *Variability, Sampling, Rainfall, Solar radiation, On-site tests, Climates, Seasonal, Heat budget, Evapotranspiration, Moisture content, Retention, Root zone, Slopes, Rainfall, Weather, Soil physical properties.

lentifiers: Soil moisture variability.

he influence of various environmental factors on oil moisture variability in the 0-8 cm horizon is examined. The investigation of the influence of egetation types revealed at least three tentative riability groups (in order of increasing variabili-) corresponding to areas of recent cultivation, eas of permanent or ley grass, and predominantly ncultivated moor or heathland areas. The dynam- nature of seasonal variability changes are illus- ated and correlations established with the nounts of rainfall and insolation in the week eceding sample collection, and the degree of oisture saturation at the time of sampling. equired sample size was directly related to mean oisture content, or the degree of moisture satura- n, and the amount of insolation. It is suggested erefore that a decrease in soil moisture content is sociated with a decrease in the variance of sam- e means, and an increase in moisture content is sociated with an increase in variance. ntifiers: Reservoir water temperature predict-

eral recent mathematical models for analyzing ervoir temperature stratification involve ex- ination of hourly temperature changes. Their in practical applications is limited by the large ount of data required, and a more general model calculate reservoir storage for bridging long ught periods requires examination of many nbinations of reservoir storage levels and sonal inflow patterns. Because 30 or more years lata are required, the model is practical only if a g computation interval, such as one month, can used. A practical management model must use eralized data such as average air temperature average radiation must be capable of planning ases through specific outlets or automatically cting the outlets that will maintain outflow tem- atures within a desired range as long as possible the temperature of the remaining stored water uld be held at an optimum value. A computer gram was developed that conforms to these uirements and automatically calibrates the del. (Knapp-USGS)

RTICAL TEMPERATURE STRUCTURE AND TER SURFACE HEAT EXCHANGE,
nsylvania Univ., Pa.
n Eric Edinger.
er Resources Research, Vol 6, No 5, p 1392-5, October 1970. 4 p, 1 fig, 1 tab, 6 ref.

criptors: *Water temperature, *Heat transfer, xing, Meteorology, Lakes, Convection, Mathe- ical studies, Diffusion, Dispersion, Heat budget, t balance, Seasonal, Thermal stratification, ervoirs.
tifiers: Temperature structure (Lakes).

alance is assumed between the time change in storage and the net vertical dispersive heat sfer within a water column. The average sur- temperature and its amplitude are related to surface heat exchange using the concept of equilibrium temperature. This results in a set of relationships for using meteorological data for estimating the seasonal time-variance of vertical temperature structure of lakes or reservoirs. (Knapp-USGS)

WATER BALANCE OF LAKE CHALA AND ITS RELATION TO GROUNDWATER FROM TRITIUM AND STABLE ISOTOPE DATA,
International Atomic Energy Agency, Vienna (Austria).
Bryan R. Payne.
Journal of Hydrology, Vol 11, No 1, p 47-58, July 1970. 12 p, 3 fig, 2 tab, 12 ref.

Descriptors: *Surface-groundwater relationships, *Lakes, *Tracers, *Water balance, *Tritium, Hydrologic budget, Stable isotopes, Radioisotopes, Tracking techniques, Recharge, Discharge (Water), Groundwater movement, Water chemistry, Water yield, Irrigation water.
Identifiers: Lake Chala (Kenya).

Artificially injected tritium was used to estimate the water balance of Lake Chala, Kenya, which has no surface inflow or outflow. Over 5 years mean annual subsurface inflow and outflow are estimated to be 12.5 million cu m and 8.2 million cu m respectively. Environmental tritium cannot be used for such a balance estimation. The relation of the lake to springs in the area was studied on the basis of the deuterium and oxygen-18 content of the waters. None of the springs derives a major component of its discharge from the lake. Tritium concentrations of two springs point to a high probability of partial recharge by lake water. (Knapp-USGS)

DYNAMIC MODEL STUDY OF LAKE ERIE, PART I. SIMILITUDE CRITERIA AND EXPERIMENTAL SET-UP,
State Univ. of New York, Buffalo. Faculty of Engineering and Applied Sciences.
Ralph R. Rumer, Jr.
Available from NTIS as PB-195 544, $3.00 in paper copy, $0.95 in microfiche. Civil Engineering Report No. 18.1, August, 1970. 43 p, 9 fig, 21 ref. FWQA Program Grant WP-00837.

Descriptors: *Lake Erie, *Model studies, *Hydraulic models, *Simulation analysis, Currents (Water), *Hydraulic similitude, Synthetic hydrology, Water circulation, Movement, Water quality, Water pollution control, Dilution.
Identifiers: Rotating model.

Both analytical and experimental investigations employed to provide basic information concerning water movement in the Lake. The knowledge and experience acquired in the course of this study should improve our capability to construct and operate rotating hydraulic models. This information should also assist in the overall water quality management of the Lake. The studies reported here deal with the idealized conditions of zero wind stress (including the inflow of the Detroit River and the outflow of the Niagara River) and, under this same flow condition, with the superposition of a uniform westerly wind over the surface of the Lake. The water mass is isothermal and variations in density are assumed absent. Under these conditions, investigations of the circulation patterns were conducted. Also studied was the oscillation of the entire water mass in the model lake. In particular, attention was given to the transient effect that this mass oscillation had on the otherwise steady-state circulation pattern and its effect on the mixing and dilution of waste discharges into the lake. The mixing and dilution of tracers introduced at various positions in the model lake were also studied under these same conditions of zero wind stress and constant throughflow and with the superposition of the westerly wind. A highly idealized model of Lake Erie was also constructed and operated. This model was rectangular in shape, of constant depth, and had the same length to width ratio as Lake Erie. Circulation patterns, the decay of sciches, and mixing of tracers were also studied in this idealized model. The results obtained from the idealized rectangular basin helped to delineate the major effects of geometrical variations that were present in the scaled Lake Erie model. This report recounts the development of the laboratory and the model lake and summarizes the analytical and experimental work accomplished thus far. (See also W71-00622).

DYNAMIC MODEL STUDY OF LAKE ERIE, PART II, ANALYTICAL AND EXPERIMENTAL RESULTS,
State Univ. of New York, Buffalo. Faculty of Engineering and Applied Sciences.
Ralph R. Rumer, Jr.
Available from NTIS as PB-195 545, $3.00 in paper copy, $0.95 in microfiche. Civil Engineering Report No 18.2, August, 1970. 39 p, 2 tab, 22 fig, 33 ref. FWQA Program Grant WP-00837.

Descriptors: *Lake Erie, *Model studies, Hydraulic models, *Simulation analysis, Currents (Water), *Hydraulic similitude, Synthetic hydrology, Water circulation, Movement, Water quality, Water pollution control, Dilution.
Identifiers: Rotating model.

This second report considers the experimental results obtained and the relationship of these results to various mathematical model approaches to the hydraulic study of Lake Erie. Based on the experimental and analytical results of this study, the following summarizing statements are made regarding the dynamic behavior of Lake Erie. In the absence of wind, the throughflow caused by the inflow of the Detroit River and the outflow of the Niagara River generates significant currents and easily observable patterns of circulation. The presence of westerly wind significantly alters the circulation patterns of Lake Erie as observed in the absence of wind. A procedure for relating model wind speeds to prototype wind speeds based on similarity between wind set-up in model and prototype has been presented. The period for the first mode mass oscillation in the model lake is in good agreement with calculated and observed periods. Observed detention periods show significant short circuiting for the homogeneous lake with no wind stress. Only limited correspondence can be achieved in modeling dispersion in vertically distorted Froude models of very large bodies of water. (See also W71-0062).

COMPILATION OF DATA FOR MICHIGAN LAKES,
Geological Survey, Lansing, Mich.
J. B. Miller, and T. Thompson.
Geological Survey Open-file Report, June 1970. 368 p, 1 fig, 1 tab.

Descriptors: *Hydrologic data, *Lakes, *Synoptic analysis, Data collections, Gaging stations, Inflow, Lake stages, Hydrographs, Maps.
Identifiers: Lake outflow, Lake drainage area, Basic data.

Lake data collected in Michigan through water year 1968 (September 30, 1968) are presented. Included, for each lake, are a description of the lake, a list of discharge measurements made on the inlet and outlet streams, quality of water data, location maps, and lake-stage hydrographs. Daily readings of lake levels were usually made on the lakes, but in this report only the monthly extremes are shown in the hydrographs. That is, the highest and lowest readings each month are plotted. (Woodard-USGS)

PHOSPHATE REDUCTION IN LAKES BY PRECIPITATION WITH ALUMINIUM SULPHATE,
Swedish Water and Air Pollution Research Laboratory, Stockholm.
A. Jernelov.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 2, 1970. Preprint. 5 p, 4 fig, 1 tab.

Descriptors: *Chemical precipitation, *Phosphates, *Lakes, Aluminum, Sulfates, Eutrophication, Oxygen, Sediments, Algae, Calcium, Chlorophyta, Cyanophyta, Toxicity, Seasonal, Municipal wastes, Depth, Coliforms, Iced lakes, Diatoms, Water management, Water pollution control, Water quality control, Flocculation.
Identifiers: *Phosphate reduction, Stockholm (Sweden), Phragmites, Nymphaea, Grass- and silver-carps, Invertebrates, Mysis relicta, Neuropteran larvae, Cryptophyceae, Lake restoration.

Release of phosphate from anaerobic bottom sediments with and without addition of aluminum and calcium were studied. Aluminum was chosen rather than calcium because it gave better flocculation. Toxicological studies of invertebrates were made to determine effect of aluminum hydroxide formed at precipitation of lake water with aluminum sulphate. Experiments showed the most suitable time for adding aluminum sulphate was when the greatest amount of the 'mobile' phosphorus in the aquatic system was in phosphate form. Swedish shallow lakes should be precipitated in early spring immediately after ice desolution. In deeper lakes, the treatment can be done in spring or autumn, immediately before the circulation. Lake Langsjon--a eutrophic shallow lake near Stockholm--was precipitated in April 1968 with about 50 grams granulated aluminum sulphate/cubic meter of lake volume. Results were: lowered concentration of total phosphorus, somewhat better oxygenation during the 1968-1969 winter, and no release of phosphate from the sediments although conditions were anaerobic. As the trend for the standing crop of planktonic algae in the lake is negative, no certain effect of precipitation on algae numbers can be determined from the precipitation. (Jones-Wisconsin)

DISTRIBUTION OF RIVER WATERS IN THE NORTHERN PART OF THE LAKE BAIKAL AS INDICATED BY HYDROCHEMICAL DATA (IN RUSSIAN),
V. T. Bogdanov.
Doklady Academy of Sciences of USSR, Vol 185, No 3, p 649-652, 1969. 1 fig, 2 tab, 4 ref.

Descriptors: *Lakes, *Tributaries, Chemical analysis, Hardness (Water), Oxygenation, Temperature, Winds.
Identifiers: Lake Baikal (USSR), Hydrocarbonates.

Waters of the rivers flowing into the northern part of the Lake Baikal are distinguished from the lake water by the relative contents of several constituents, such as hydrocarbonates, calcium, and silica, as well as the degree of hardness and oxygenation. These features permitted to establish the range of the beneficial influence of northern tributaries on the volume and oxygenation of the lake. The latter process is augmented by winds, especially those of the fall season. (Wilde-Wisconsin)

INTERRELATIONS BETWEEN SULPHUR AND CARBON TURNOVER IN MEROMICTIC LAKES,
Akademiya Nauk SSSR, Mowcow. Institut Biologii Vnutrennykh Vod.
Yu. I. Sorokin.
Archiv fur Hydrobiologie, Vol 66, No 4, p 391-446, 1970. 33 fig, 22 tab, 31 ref.

Descriptors: *Lakes, *Carbon, *Sulfur, Temperature, Oxygen, Phytoplankton, Zooplankton, Bacteria, Turnovers, Sulfur bacteria, Distribution, Laboratory tests, Primary productivity, Photosynthesis, Migration, Chemical properties.
Identifiers: *Sulfur-carbon turnover, Meromictic lakes, Redox potential, Carbon assimilation, Susljaev's sampler, Volga Region (USSR), Vertical distribution.

This voluminous report is primarily concerned with sulphur-cycle organisms of three meromictic lakes of northern Russia. Investigations of lake profiles included temperature, oxygen concentration, redox potential, and transformations of sulphur compounds. The survey recorded the distribution of phytoplankton, zooplankton, and sulphur bacteria. A part of the study was devoted to laboratory observations of the chemical and biological oxidation of sulphides as far as these processes are related to the chemo-autotrophic cycle of the investigated meromictic lakes. The results showed that oxidation of hydrogen sulphide provides an additional source of primary production in the form of bacteria consumed by zooplankton. (Wilde-Wisconsin)

STREAM OF ENERGY IN THE ECOSYSTEM OF AN EUTROPHIC LAKE (IN RUSSIAN),
Akademiya Nauk SSSR. Zoologicheskii Institut.
G. G. Vinberg.
Doklady Academy of Sciences of USSR, Vol 186, No 1, p 198-201, 1969. 1 tab.

Descriptors: *Lakes, *Energy, *Energy equation, Biomass, Phytoplankton, Zooplankton, Benthos, Fish, Nutrients, Primary productivity, Correlation analysis, Mathematical studies, Ecosystems.
Identifiers: Food consumption, Food assimilation, Lake Driviaty (Belorussia).

This ecosystematic survey of the 3000-hectare eutrophic lake included determinations of primary production, phytoplankton, zooplankton, zoobenthos, and population as well as fish nutrition. Each component of the ecosystem was appraised in terms of its biomass (B), production (P), catabolism (T), loss of energy in exchange and assimilation of food (A—T..P), consumption of food (R), and the corresponding rations P/B, T/B, and P/A. For a population having a constant biomass, the coefficient P/B expresses the 'turnover rate,' whereas the value B/P--the 'turnover time.' Both oxygen consumption method and solution of the equation rendered similar T values. The fish consumed during the summer 2.65% of the total supply of energy; the annual harvest of fish constituted only 0.14% of the total primary production. (Wilde-Wisconsin)

TROPHIC NATURE OF SELECTED WISCONSIN LAKES,
Wisconsin Dept. of Natural Resources, Madison. Div. of Environmental Protection.
Lloyd A. Lueschow, James M. Helm, Donald R. Winter, and Gary W. Karl.
Transactions of the Wisconsin Academy of Sciences, Arts and Letters, Vol 48, p 237-264, 1970. 3 fig, 5 tab, 5 ref.

Descriptors: *Wisconsin, *Lakes, *Eutrophication, Oligotrophic, Sampling, Water quality, Phosphorus, Rooted aquatic plants, Chara, Weed control, Size, Depth, Hydrogen ion concentration, Hardness (Water), Alkalinity, Plankton, Nitrogen, Temperature, Dissolved oxygen, Hypolimnion, Light penetration, Zooplankton, Diatoms, Cyanophyta, Copper sulfate, Chlorophyta, Chlorella, Epilimnion.
Identifiers: Inorganic debris, Flagellates, Volatile solids.

Several water quality parameters of 12 Wisconsi lakes were evaluated. Parameters selected include nitrogen and phosphorus, temperature, dissolve oxygen, water transparency, and plankton analysis The lakes are ranked on annual means of the fiv parameters. Presence of dissolved oxygen in th hypolimnion during summer stagnation has an im portant effect on fish, but can be misleading as trophic index since the volume of the hypolimnio tempers the effect of production and decompos tion. Plankton samples collected did not fully me sure the standing crop of organic production sinc rooted or attached growths were ignored, and sma algal cells may pass through nets. Diatoms ar zooplankton did not develop nuisance conditions any of the lakes. Monthly analysis for organ nitrogen produced a ranking that was reasonab consistent with transparency, plankton, and recre tional potential; analyses for soluble phosphor had a coefficient of variation approaching 100 indicating samples were inadequate for reliab confidence interval about a mean; analysis for to phosphorus gave figures suggesting which lak would be essentially free of aquatic nuisances a which would experience nuisance weed growths algal blooms during most of the growing seaso (Jones-Wisconsin)

ntifiers: Heat transfer coefficients.

contrast to small turbulent bodies of water, hin which the basic heat transfer agent oughout the year is turbulent water flow, in the ters of deep water bodies heat transfer occurs ring different seasons and in different parts of water bodies under the influence of different tors. Accordingly, six periods were defined with ferent heat transfer patterns in the water layers deep lakes and reservoirs, and the vertical and izontal temperature distributions were ex-ined. It was found that the test heat conductivity fficients were not uniform over the depth and gth of reservoirs. For a stationary regime the o of the heat conductivity coefficients is inver-y proportional to the temperature gradients of bounding layers. The degree of nonuniformity eat exchange between a water body and the at-sphere is proportional to its mean intensity. The ults and observations of several lakes are sented. (Novotny-Vanderbilt)

gon State Univ., Corvallis.
id A. Bella.
rnal of the Sanitary Engineering Division, ceedings of the ASCE, Vol 96, No SA5, Paper 8, p 1129-1146, Oct 1970. 11 fig, 15 ref.

scriptors: *Stratification, *Temperature, *Ox-n, Lakes, Dissolved, Mixing, Reaeration, Reser-s, Algae, Hypolimnion, Mathematical models, pth, Respiration, Washington.
Identifiers: Vertical dispersion coefficient, Lake Sammamish (Washington).

A mathematical model describing the dissolved oxygen variations in a stratified lake is developed. The model is one dimensional and includes dissolved oxygen variation with depth and time. The model describes the combined effect of reaeration, photosynthetic oxygenation, vertical mixing and oxygen uptake. A method for estimating hypolimnetic oxygen demands in stratified lakes was presented and used for analysis of data from Lake Sammamish, Washington. The possibility that the hypolimnetic DO depletion during summer months in Lake Sammamish was largely due to benthal oxygen demand was investigated and analysed. A series of model computations using finite-difference methods demonstrates that hypolimnetic oxygen levels within stratified lakes were more sensitive to both vertical mixing and hypolimnetic respiration to either photosynethetic oxygenation or reaeration. EFFECTS OF ORGANIC ACIDS ON THE FLOCCULATION OF SUSPENDED SEDIMENTS IN TROPICAL MAN-MADE LAKES,
Ife Univ. (Nigeria).
L. Olayinka Asseez.
Journal of Hydrology, Vol 11, No 3, p 253-257, September 1970. 5 p, 1 fig, 1 tab, 1 ref.

Descriptors: *Organic acids, *Flocculation, *Deposition (Sediments), *Suspended load, *Reservoir silting, Sediment yield, Sedimentation, Dispersion, Sampling, Sediment control.
Identifiers: Kainji Lake (Nigeria).

Thirty-five suspended sediment samples from Kainji Lake, Nigeria were studied to determine the effect of dispersion on the natural particle size distribution in the natural water. The rapid rate of decay of the submerged plants released a copious amount of humic acids which served as strong flocculants, and this has an important effect on the settling rate of suspended sediments, particularly in tropical lakes. This decay was highest in the Foge Island area, which was submerged three days after the gates of the dam had been closed. Considering deposition in stagnant waters, flocculation arising from decaying organic matter may be as important as reduction in velocity. The rate of sedimentation within a reservoir can be estimated from data on volume and thickness of sediments deposited during a given period. If flocculation arising from decay of organic matter is high during the first few years, a later comparable rate of deposition cannot be assumed even when all other conditions remain constant. EXTRACTION TERM MODELS OF SOIL MOISTURE USE BY TRANSPIRING PLANTS,
Stanford Univ., California.
F. J. Molz, and Irwin Remson.
Water Resources Research, Vol 6, No 5, p 1346-1356, October 1970. 11 p, 6 fig, 1 tab, 18 ref.

Descriptors: *Soil-water-plant relationships, *Transpiration, *Soil water movement, *Moisture uptake, *Root systems, Velocity, Unsaturated flow, Mathematical models, Respiration, Translocation, Soil moisture, Flow, Hydraulic conductivity, Moisture content, Moisture availability, Water utilization, Root zone.
Identifiers: Soil water extraction.

A mathematical model is developed describing moisture removal from soil by the roots of transpiring plants. The model uses a macroscopic extraction term in the one-dimensional soil moisture flow equation. It describes both moisture removal by the plant and induced moisture movement through the soil. A numerical procedure based on the Douglas-Jones predictor-corrector method is used to solve the model, and solutions are compared with experimental data. The results indicate that extraction term models are computationally and physically feasible and give insight into the mechanics of the overall moisture extraction process. (Knapp-USGS)

Identifiers: *Rio Grande Plains (Texas).

The saline, clay soils of the Rio Grande Plains, Texas, are considered drought-prone because of high salt content, low rainfall and high evaporation. Owing to past overgrazing, many grass species have decreased or disappeared and the area has been invaded by xeric shrubs. A vegetational analysis of a study area was performed after it had been closed to grazing for 5 years. Only 4 grass species were identified and their heights were below 2 inches. Plant densities ranged from 2500-66,000 per acre and herbage production was not measurable. Three months later after a hurricane (Beulah) had resulted in a 13 inch rainfall increase, the area was again surveyed. A large influx of annual and short-lived perennial grasses had changed plant composition, densities and yield. Densities ranged from 400,000-1,000,000 plants/acre and mean production ranged from 731.7-1743.7 lbs/acre. Production of these short-lived grasses provided a suitable

microenvironment for establishment of more suitable grasses. (Casey-Arizona)

MICROBIOLOGICAL PROBLEMS IN THE ARID ZONE OF WEST PAKISTAN,
University of the Punjab, Lahore (Pakistan). Dept. of Zoology.
Rafat H. Jafri.
Pakistan Journal of Science, Vol 20, No 5 and 6, p 308-312, September-November 1968. 32 ref.

Descriptors: *Arid lands, *Microbiology, *Nitrogen fixing bacteria, *Decomposing organic matter, Public health, Ammonification, Diseases, Deserts, Winds, Sands, Semiarid climates, Microorganisms.
Identifiers: *Pakistan.

Nearly two-thirds of West Pakistan is arid. High temperatures, strong dessicating winds, flash floods and erratic rainfall are interacting factors contributing to the steady 1 mile per year advancement of the desert. It is estimated that about 200,000,000 acres of land could be brought into cultivation but so far only 45,000,000 acres are being farmed. Much work must be done in this arid zone if progress is to occur. The author feels that microbiological problems unique to the arid zone must be attacked. Areas suggested for study are: (1) Microorganisms involved in crop and timber diseases, (2) The ammonifying microflora of unploughed desert soils, (3) Nitrifying bacteria of the rhizophores of desert plants, (4) The microbial balance of areas soon to be newly irrigated, (5) Microbial decomposition of organic matter for fertilizer, (6) Food decay microorganisms, (7) The use of disease-producing microorganisms to control wild animal populations and (8) Public health. INVASION OF MEDUSAHEAD INTO THE GREAT BASIN,
Agricultural Research Service, Reno, Nev. Crops Research Div.; and Nevada Agricultural Experiment Station, Reno.
James A. Young, and Raymond A. Evans.
Weed Science, Vol 18, No 1, p 89-97, January 1970. 3 fig, 6 tab, 37 ref.

Descriptors: *Weeds, *Great Basin, *Soil moisture, *Vegetation establishment, *Environmental effects, Arid lands, Semiarid climates, Oregon, California, Idaho, Nevada, Rainfall, Soil water, Water requirements, Invasion, Biological communities, Ranges, Sagebrush, Soil types, Clays, Weed control, Plant populations.
Identifiers: *Medusahead, *Annual plants, *Vertisols, *Site degradation.

Medusahead (Taeniatherum asperum (Sim.) Nevski), introduced into Oregon in the late 19th century, has successfully invaded the annual-dominated rangeland of northcentral California and spread into eastern Oregon and western Idaho. Infestations have reached the edge of the Great Basin along the northern California-Nevada border, with the plants found most commonly in clay soils, which have a high water-holding capacity. This preference is apparently due to medusahead's greater water needs when compared with other range annuals. Medusahead is more likely to invade vertisol sites populated by sparse native plant communities than more complex low sagebrush (Artemisia arbuscula Nutt.) or low sagebrush-woodland communities on similar clay soils. However, medusahead can invade and occupy these more complex communities if they are degraded to a low seral state. Plant communities in which big sagebrush (Artemisia tridentata Nutt.) is dominant and soil texture ranges from medium to coarse prove very resistant to medusahead invasion. Although medusahead might appear restricted to certain soil and vegetation assemblages, site degradation coupled with favorable fall and spring precipitation enhance its probability of becoming established. (Carr-Arizona)

A. L. Black.
Agronomy Journal, Vol 60, No 2, p 213-216, March-April 1968. 8 tab, 15 ref.

Descriptors: *Wheatgrasses, *Nitrogen, *Phosphorus, *Fertilization, *Soil water, Montana, Arid lands, Semiarid climates, Forage grasses, Forages, Fertilizers, Crop response, Crop production, Efficiencies, Range grasses, Range management, Grama grasses, Water utilization, Plant growth, Nutrients.
Identifiers: *Water-use efficiency.

A field of crested wheatgrass (Agropyron desertorum (Fisch.) Schult., 'Standard') and adjoining native rangeland was treated with N and N-P fertilizers during the years 1961-1964. Fertilization consistently increased forage yields on both sites, with the greatest response occurring the year of fertilization. Residual effects were present and significant 1 to 2 years later, however. Plant P content increased substantially when P was applied the first year and 3 years later, regardless of any N treatment. When N was applied at a rate of 45 kg/ha or greater, water-use efficiency of both grasses increased 1.5 to 2.5-fold for 2 or 3 years. This occurred regardless of P treatment. Increase in water-use efficiency appeared to be partially due to more efficient extraction of subsoil water. When N was applied alone at rates of 45 or 90 kg/ha over the 4-year study period, plant recovery of N averaged 65.8% for crested wheatgrass and over 60.0% for native grasses (Agropyron smithii Rydb., Stipa viridula Trin., and Bouteloua gracilis (H.B.H.) Lag.). However, when N and P were applied together recovery of N was greater (73.1%) for crested wheatgrass, but less (38.2%) for native grasses. N application increased crude protein production for both grasses. (Carr-Arizona)

RESTING ROOTS OF PINUS HALEPENSIS: STRUCTURE, FUNCTION, AND REACTION TO WATER STRESS,
Hebrew Univ., Jerusalem (Israel). Dept. of Plant Physiology.
B. Leshem.
Research grant No. 10-FS-7 from the Forest Service, U.S. Department of Agriculture. Botanical Gazette, Vol 131, No 2, p 99-104, June 1970. 7 fig, 2 tab, 25 ref.

Descriptors: *Pine trees, *Root systems, *Moisture stress, *Semiarid climates, *Soil-water-plant relationships, Soil moisture, Soil water, Water stress, Plant growth, Plant physiology, Phenols, Irrigation, Lignins.
Identifiers: *Aleppo pine, *Resting roots, *Israel, *Metacutization, Tissue, Apical meristem, Soil water potential.

Aleppo pine (Pinus halepensis Mill.), found in subhumid to semiarid Mediterranean regions, ceases most root growth as summer approaches. The roots enter a resting state in which metacutization occurs. This is a special chemical process of lignification and suberization taking place in the cortex and dormant root cap. Compared with growing roots, the meristematic region of the resting roots were greatly reduced and heterogeneous and were completely surrounded by the metacutis. Metacutization developed in the outer cells of the phenol-containing zones of the apical meristem, forming a layer between the meristematic and mature tissues. The metacutis was found to be of no value as a protective sheath. Metacutization could be induced by lowering soil water potential to -7 bars, but root growth resumes, even in dry summers, after irrigation. (Carr-Arizona)

Identifiers: *Introduced plants, *Potenti evapotranspiration, *Climatic classificatio *Homoclimes, *India, Megathermals.

Some theories on the nature of correlatio between vegetation zones and climatic factors a briefly reviewed and 2 systems of climatic classi cation are discussed in some detail. Koppe system recognized the inadequacy of identifyi climatic regions by temperature and rainfall da but failed to evaluate adequately the heat factor climate. Thornthwaite's system utilized a cent parameter-potential evapotranspiration, whi because of its dependence on energy balan serves as both a moisture and a temperature ind It is recognized that seasonal variation of effect moisture has a profound influence in the develo ment of climatic climaxes in the evolution vegetation. In discussing the introduction of t and shrub species into arid and semiarid zones, i therefore important to match climatic factors fr various parts of the world where the introduc species are native. Accompanying tables list va ties of tree and shrub species which mi profitably be introduced into Indian arid regi and corresponding world homoclimes. (Cas Arizona)

ADHESIVE HYDROCOLIOIDS SECRETED MICROSCOPIC MARINE ALGAE,
Naval Civil Engineering Lab., Port Hueneme, C
Harold P. Vind.
Available from NTIS as AD-867 080, $3.0 paper copy, $0.95 in microfiche. February 1 46 p. Technical Note N-1077.
Identifiers: *Fouling, Algae, *Algae, Adhe *Adhesives, Secretion, Gels, Proteins, Polyn Polysaccharides, Alginic acid, Marine biology, loids, Spectra (Infrared), *Hydrocolloids, rageen.

The adhesion of microscopic marine algae t walls of small containers of sea water has been died. Infrared spectra of extracts and films of

were analyzed and compared to spectra of known hydrocolloids. The studies indicate that the gels holding algae together in films are composed primarily of polysaccharide polymers similar to the seaweed hydrocolloids, carrageenan and alginic acid, but that the adhering layer of substance joining algae to foreign surfaces is mostly protein. Like all proteins in their native states, it is also a hydrocolloidal gel. Recognition that adhesive systems of marine fouling organisms are hydrocolloidal gels tells a great deal about their nature and delineates the most logical areas in which to undertake research on methods to prevent attachment of fouling organisms.

WATER BALANCE IN THE WHIPSCORPION, MASTIGOPROCTUS GIGANTEUS (LUCAS) (ARACHNIDA, UROPYGI),
Arizona State Univ., Tempe. Dept. of Zoology.
Gregory A. Ahearn.
Comparative Biochemistry and Physiology, Vol 35, No 2, p 339-353, 15 July 1970. 6 fig, 2 tab, 49 ref.

Descriptors: *Water balance, *Water loss, *Cuticle, *Animal physiology, Invertebrates, Respiration, Arizona, Temperature, Humidity, Arid lands, Transpiration, Weight, Environmental effects, Absorption, Xerophilic animals.
Identifiers: *Arachnida, *Whipscorpion, *Terrestrial arthropod water balance, Oxygen consumption, Arthropod transpiration, Integument, Cuticular water loss, Dessication.

Studies on rates of water loss in arachnids have indicated differences between temperate and desert forms. In specimens of an Arizona mesic form, the whipscorpion, measured water loss under controlled environmental conditions near zero percent relative humidity was exponentially related to weight with the heavier animals losing the least. With temperature ranging over 20-40 degrees centigrade, rates of transpiratory water loss (integumentary and respiratory components) increased gradually to 37.5 degrees and suddenly elevated 3-fold. This probably represented breakdown of a waterproof cuticle since water loss rates above 37.5 degrees were much greater than increases in oxygen consumption. At high relative humidities water loss was low but became linear with time at lower levels. Animals between 0.1-2.0 grams on saturated sponges recovered large proportions of water lost by predessication within 2 hours while larger specimens gained nothing. Apparently water uptake from moist substrates is active, involving drinking and possibly cuticular absorption. Comparisons with data on xeric arachnids indicates there may be an order of magnitude difference in water loss between xeric and mesic forms, the loss being greater in mesic forms. (Casey-Arizona)

THE WATER ECONOMY OF THE SAGE SPARROW, AMPHISPIZA BELLI NEVADENSIS,
Oregon State Univ., Corvallis. Dept. of Zoology.
Ralph R. Moldenhauer, and John A. Wiens.
Supported by the National Science Foundation (Grant GB-6606). Condor, Vol 72, No 3, p 265-275, July 1970. 5 tab, 2 fig, 29 ref.

Descriptors: *Birds, *Xerophilic animals, *Ecology, *Animal behavior, *Water conservation, Arid lands, Moisture stress, Osmotic pressure, Animal physiology, On-site investigations, Laboratory tests, Saline water, Water loss, Water requirements, Water balance, Thermal stress, Weight.
Identifiers: *Succulents, Sage Sparrows.

Physiological and behavioral studies were undertaken to determine any adaptations peculiar to desert life in the xerophilic Sage Sparrow. Normal ad libitum water intake in captive birds was about 100 percent body weight per day and fecal drop moisture content was about 76 percent. Restricted to succulents, normal body weight was maintained on lettuce (95 percent water) and Tenebrio larvae (60 percent), and fecal water content was about 66 percent. When confined to a dry diet without water, motor activity increased, food intake decreased, gradual weight loss occurred and the birds died in 8 days. Two factors determine a bird's ability to survive on saline water: (1) Tolerance of high blood osmotic pressures (2) Renal concentration capacity. In both, Sage Sparrows are unexceptional. Individuals lost weight on NaCl drinking solutions of 0.25 molar or more and maximum urine-plasma chloride ion ratio was 2.4. Field studies showed that breeding birds satisfied their summer water demands by eating succulent vegetation and insects. Behavioral responses lead to avoidance of heat stress with consequent body water conservation. This compensates for the lack of any unique physiological water conservation mechanisms. (Casey-Arizona)

THE STATUS OF SUMMER ANNUALS IN PALESTINE,
Hebrew Univ., Jerusalem (Israel). Dept. of Botany.
M. Negbi.
Israil Journal of Botany, Vol 17, No 4, p 217-221, 1968. 1 tab, 20 ref.

Descriptors: *Desert plants, *Soil moisture, *Arid lands, *Deserts, *Environment, Habitats, Summer, Semiarid climates, Plant physiology, Germination, Seeds, Migration, Ecological distribution.
Identifiers: *Summer annuals, *Israel, *Central Asia, *Near East, *Adaptation, Seedlings.

A habitat study of summer annuals in Israel reveals that 45 per cent of the plants grow in dry habitats where winter rainwater is stored in the soil for summer use. Dispersal, germination, and seedling establishment of five desert annuals (Salsola inermis Forssk., Salsola volkensii Schweinf. et Aschers., Salsola kali L., Aellenia autrani (Post) Zoh., and Kochia indica Wight) are discussed in order to illustrate their adaptation to their arid environment. Based on a study of migration and distribution of Kochia indica and Salsola kali, the author presents a hypothesis for the Central Asiatic origin of summer annuals endemic to the Near Eastern deserts. THE VEGETATION OF SARATOGA SPRINGS, DEATH VALLEY NATIONAL MONUMENT, CALIFORNIA,
Nevada Southern Univ., Las Vegas. Dept. of Biological Sciences.
W. Glenn Bradley.
U.S. National Park Service Contract No 14-10-0434-1989. Southwestern Naturalist, Vol 15, No 1, p 111-129, June 1, 1970. 4 fig, 7 tab, 12 ref.

Descriptors: *Xerophytes, *Phreatophyes, *Marsh plants, *Plant populations, *Environmental gradient, Arid lands, California, On-site investigations, Halophytes, Saline soils, Standing crop, Water demand, Sampling, Vegetation, Distribution patterns, Frequency, Salt marshes.
Identifiers: *Species diversity, *Death Valley, Plant cover, Plant communities, Perennial.

A study was made of the perennial vegetation of a spring-fed salt marsh and its adjacent environment. The vegetation of the area forms a mosaic of plant communities with sharp boundaries. Three major vegetation types occur--xeric shrub, phreatophyte and salt marsh. The species and distributions of each are described. In species diversity, the xeric shrub communities are depauperate, reflecting the harsh physical conditions under which they survive. The phreatophyte communities are more diverse and occur in areas where the water table is high. The standing crops of all 3 communities were estimated and the value for the salt marsh community was by far the greatest. This was reflected in a comparison of the communities along a moisture gradient in which the salt marsh community also had the greatest number of perennial species and percent of cover. Salinity gradients and water gradients are apparently the crucial factors in vegetation distribution and are responsible for the sharp boundaries of the community mosaic. (Casey-Arizona)

FIELD STUDIES ON THE SANDGROUSE OF THE KALAHARI DESERT,
Natal Univ., Pietermaritzburg (South Africa). Dept. of Zoology.
Gordon L. Maclean.
Supported by U.S. Public Health Service Grant ES 00008 (Environmental Health). In: The Living Bird-7th Annual of the Cornell Laboratory of Ornithology, p 209-235, 1968. 17 fig, 1 tab, 45 ref.

Descriptors: *Birds, *Ecology, *Arid lands, *Temperature, *Regulation, *Water requirements, Breeding, Calcareous soils, Dunes, Semiarid climates, Seeds, Surface waters, On-site investigations, Saline water, Habitats, Dry seasons, Cooling, Animal physiology.
Identifiers: *Africa, *Kalahari Desert, *Gular fluttering, *Sandgrouse.

The Namaqua Sandgrouse (Pterocles namaqua live in shrubby calcrete along river banks while the Spotted Sandgrouse (P. burchelli) live in the grassy dunes of the Kalahari Desert. Both species capitalize on the most abundant food in deserts-dry seeds. Unlike insectivorous birds, however, they are dependent upon free surface water and must often travel long distances for it. A 100-mile round trip is a probable maximum breeding range. Drinking is usually done in flocks at consistent morning hours. Gular fluttering is the sole physiological cooling mechanism and appears to be highly efficient. Behavioral cooling and breeding mechanisms are described. Only the breeding habits of manaque have been observed, and it may breed at any time of the year but usually does so during the dry season. The male wets his breast feathers at a pond and flies to the young, supplying them with water. These species may be affected by the increases of waterholes due to human activities. (Casey-Arizona)

THE NOCTURNAL BEHAVIOUR OF XEROPHYTES GROWN UNDER ARID CONDITIONS,
Colorado State Univ., Fort Collins. Dept. of Watershed Resources.
I. Gindel.
New Phytologist, Vol 69, No 2, p 399-404, April 1970. 2 tab, 25 ref.

Descriptors: *Transpiration control, *Stomata, *Xerophytes, *Arid lands, *Soil-water-plant relationships, Moisture deficit, Dew, Humidity, Field capacity, Wilting point, Plant physiology, Plant groupings, Laboratory tests, Leaves, Nocturnal, Diurnal, Hydrogen ion concentration, Alfalfa.
Identifiers: *Relative humidity, Eucalyptus.

Nighttime leaf stomatal closure has long been thought universal in plants and a result of increased guard cell pH due to carbon dioxide accumulation. The stomatal apertures of 78 indigenous and introduced woody xerophytes grown under arid, water deficient conditions were measured in the dark and in daylight. As a percentage of total leaf area, stomatal openings were 0.017-0.122 during the day and 0.155-0.471 at night. Openings were evident during nights with dew and high relative humidity but not when relative humidity dropped to 30-40 percent. Four species (alfalfa and 3 Eucalyptus species) were pot-grown in 2 groups, one at wilting point and the other at field capacity. A much greater percentage of stomatal openings occurred in the moisture deficit group. Apparently stomatal opening in xeromorphic plants is strongly influenced by water deficit. (Casey-Arizona)

IRRIGATED CASTORBEAN, SOYBEAN, AND SAFFLOWER TRIALS AT THE NORTHEASTERN BRANCH STATION,
New Mexico Agricultural Experiment Station, University Park.
David H. Williams.
March 1968, 12 p, 13 tab. Research Report 133.

Descriptors: *Irrigation effects, *Crop production, *Plant growth, *New Mexico, Disease resistance, Soybeans, Arid lands, Leaves, Plant pathology, On-site tests, Seeds, Data collections, Seeds, Climatic data.
Identifiers: *Castorbeans, *Safflower, Tucumcari (New Mexico), Commercial production, Leaf disease, Root disease, Seed shattering, Trials, Hulling.

Irrigated variety trials of castorbeans, soybeans and safflower were conducted at the Northeastern Branch Station, Tucumcari, New Mexico. Materials, methods and results are discussed for each crop. This study was undertaken because local producers expressed interest in finding crops to supplement sorghum and alfalfa. Tables include data on yields, hulling percentages, height, shattering, date of 10-percent flowering (safflower), cultural practices, climatic conditions and disease damage (safflower) for castorbean (1953-1962), soybean (1955-1964) trials. Castorbean yields indicate the crop is well adapted for commercial production in this area. No variety, strain or hybrid consistently produced outstandingly high yields. Baker 296 is the only tested variety which should not be grown due to leaf-disease susceptibility. Seed shattering was a major problem in the soybean trials. Lee was the only variety which exhibited a high and prolonged shatter resistance. Favorable yields were obtained, showing Lee is adapted for production in this area. Safflower should not be grown under irrigation here because of severe root disease. (Popkin-Arizona)

WATERFOWL - WATER TEMPERATURE RELATIONS IN WINTER,
Colorado State Univ., Fort Collins. Natural Resources Center.
Ronald A. Ryder.
Available from NTIS as PB-195 612, $3.00 in paper copy, $0.95 in microfiche. Colorado State University Environmental Resources Center Completion Report Series No 21, June 30, 1970. 60 p, 53 fig, 11 tab, 10 ref. OWRR A-006-COLO (3).

Descriptors: *Water temperature, *Climates, *Ducks (Wild), *Overwintering sites, Aquatic life, Waterfowl, Environment, Aquatic environment, Aquatic habitats, Wildlife habitats, Cold regions, Migration patterns, Migratory birds.
Identifiers: Water temperature - wildfowl relations.

A study was conducted in Larimer County, Colorado, 1967-70, to investigate the ability of waterfowl to winter north of the 0 degree C isotherm. Ground and aerial counts were made of selected duck and goose concentration areas where waterfowl maintained patches of open water. The number of birds using an area and the size of the area were estimated from aerial photographs. The area of open water per bird and ambient temperature appear to be directly related. Ten 3-hour experiments were conducted with captive, wild Mallards in a controlled temperature, cold room to determine the effect of ducks on low water temperatures. Ducks under test conditions produced significantly more heat than ducks under control conditions. The test condition metabolism represented an increase of 22.7 percent over the control metabolism. Nocturnal behavior of Redhead ducks on a pond was observed during freezing weather. Activity was greater at night during freezing weather than during warmer weather. Duck defecation rates and chemical content of feces were determined from captive ducks. (Knapp-USGS)

2J. Erosion and Sedimentation

DETACHMENT OF SOIL AGGREGATES BY SIMULATED RAINFALL,
Nebraska Univ., Lincoln. Dept. of Agronomy.
Andrew P. Mazurak, and Peter N. Mosher.
Soil Science Society of America Proceedings, Vol 34, No 5, p 798-800, September-October 1970. 3 p, 3 fig, 1 tab, 7 ref.

Descriptors: *Soil erosion, *Soil amendments, *Impact (Rainfall), Soil structure, Soil stability, Soil management, Soil stabilization, Soil texture, Puddling, Rainfall simulators, Soil surfaces.
Identifiers: Clod strength.

Detachment of naturally occurring soil aggregates when exposed to simulated rainfall increased from 76 mg of particles per cc of water to a maximum amount of 172 mg/cc as the diameters of aggregates decreased from 9,250-4,760 microns to 2,360-1,680 microns. Then, the amount of splashed soil particles decreased as the diameter of aggregate decreased. Addition of Krilium to aggregates reduced the amount of splash for aggregate fractions larger than 420 microns in diameter but increased the amount for fractions smaller than 420 microns in diameter. (Knapp-USGS)
W71-00556

STABILITY OF A SAND BED SUBJECTED TO A SHEAR FLOW OF LOW FROUDE NUMBER,
Washington Univ., Seattle. Dept. of Oceanography.
J. Dungan Smith.
Journal of Geophysical Research, Vol 75, No 30, p 5928-5940, October 20, 1970. 13 p, 10 fig, 1 tab, 18 ref. AEC Contract AT (45-1)-1752 (ref. RL0-1752-9).

Descriptors: *Sediment transport, *Bed load, *Shear drag, *Froude number, *Sand waves, Dunes, Ripple marks, Critical flow, Transition flow, Velocity, Turbulent flow, Open channel flow, Alluvial channels, Sands, Viscosity, Hydraulics, Hydrodynamics, Sedimentary structures.
Identifiers: Sand-bed stability, *Shear flow.

The problem of sand bed stability is formulated and solved for a model in which the local slope of the free surface is small relative to the slope of the perturbed lower boundary. The solution shows the bed to be unstable to perturbations of wavelength greater than the wavelengths for which the inertia of the sediment grains is important. Wave speeds and growth rates from numerical calculations are presented and compared with long- and short-wave asymptotic expressions. Although the fluctuating velocity field in the nonuniform flow is approximated by a constant eddy viscosity, a general picture of the relationship between the flow over a perturbed boundary and the observed geometrical and dynamical parameters of the resulting boundary waves can be developed. It is shown that the sand bed instability is due to local accelerations of a shear flow caused by the nonuniform boundary. If either the shear or the acceleration is eliminated from the analysis, the instability cannot be found. On the other hand, no wavelength is defined by such an analysis, and it is shown that the wavelength is determined by spatial adjustments in the turbulent velocity field. (Knapp-USGS)
W71-00560

LONGSHORE SAND TRANSPORT ON BEACHES,
Scripps Institution of Oceanography, La Jolla, Calif.
Paul D. Komar, and Douglas L. Inman.
Journal of Geophysical Research, Vol 75, No 30, p 5914-5927, October 20, 1970. 14 p, 9 fig, 2 tab, 30 ref.

Descriptors: *Sediment transport, *Beaches, *Littoral drift, *Mathematical models, Shores, Surf, Waves (Water), Currents (Water), Sands, Model studies, Bed load, Sand waves, Tractive forces.
Identifiers: Longshore currents.

Simultaneous field measurements of wave and current parameters in the surf zone and the resulting longshore transport of sand were made on two beaches under a variety of conditions. The direction and flux of wave energy was measured from an array of digital wave sensors placed in and near the surf zone. Quantitative measurements of the longshore sand transport rate were obtained from the time history of the center of gravity of sand tracer. The measurements were used to test two models for the prediction of the longshore transport rate of sand. The first model gives the immersed weight longshore transport rate of sand as proportional to the longshore component of wave energy flux. The second model assumes that the waves provide the power to move and support the sand and that the superimposed longshore current provides a longshore component that results in the longshore transport of sand. Both models successfully predict the sand transport rate. The coherence of the models appears to be based on the generation of the longshore currents by the longshore radiation stress. The models will not be equivalent if the longshore current owes its origin to some other generating mechanism such as tides or winds. (Knapp-USGS)
W71-00561

AN IMPROVED METHOD FOR SIZE DISTRIBUTION OF STREAM BED GRAVEL,
Geological Survey, Washington, D.C.
Luna B. Leopold.
Water Resources Research, Vol 6, No 5, p 1357-1366, October 1970. 10 p, 6 fig, 3 tab, 10 ref.

Descriptors: *Sampling, *Gravels, *Particle size, *Statistical methods, Dimensions, Weight, Surveys, Reliability, Statistics, Data collections, Measurement, Alluvial channels, Sediment transport.
Identifiers: Sediment sampling.

Random sampling of surface rocks on a gravel bar is biased toward larger sizes which, because of their area, are more likely to be picked up. Weighting can eliminate this bias. Data on average weight of a single rock are used to change numbers of rocks to weights, thus yielding size frequency data in

general agreement with a sieved and weighed sample. The question of what to sample depends on the use to which the data are to be put, and is treated only briefly. (Knapp-USGS)

PROBLEMS IN THE CLIMATIC GEOMORPHOLOGY OF ARID LANDS,
New South Wales Univ., Kensington (Australia). School of Geography.
J. A. Mabbutt.
Annals of Arid Zone, Vol 8, No 2, p 209-224, September 1969. 34 ref.

Descriptors: *Weathering, *Geomorphology, *Arid lands, *Climatic zones, *Land forming, Semiarid climates, Sands, Rainfall, Vegetation, Geology, Aeolian soils, Wind erosion, Classification, Paleoclimatology, Deserts, Dunes.
Identifiers: *Wadis, *Morphogenetic classification, Endoreism, Insolation weathering.

Two major problems of desert studies are: (1) The nature of the developmental processes of arid zone landforms; (2) Definitive descriptions of arid and semiarid regions. Early investigators felt that deserts were static regions consisting of relict topographical forms. Gradually, the importance of wind and water, primarily as weathering agents, has come to be recognized. It is the author's view that the physicochemical effects of water are at least as important as the physical effects, and that wind and water are complex interacting agents whose effects decrease toward the arid core areas. A number of characteristic landform phenomena are described, but their usefulness as arid zone morphoclimatic indices has been limited. Additionally, vegetation, rainfall and the presence of sand dunes are examined in terms of the delimitations and subdivisions of arid regions, but none are truly definitive. This argument is buttressed by descriptions of a wide variety of warm arid climates, many of which differ greatly in crucial descriptive parameters. There are short discussions of past climatic changes as revealed by palaeoforms and the influences of anthropogenic factors. (Casey-Arizona)

LANDFORMS AND CLIMATIC CHANGE IN THE KALAHARI AND NGAMILAND,
Cambridge Univ. (England). Dept. of Geography.
A. T. Grove.
Geographical Journal, Vol 135, No 2, p 191-212, June 1969. 11 fig, 39 ref.

Descriptors: *Landforming, *Aerial photography, *Geomorphology, *Semiarid climates, *Climatic data, Dune succession, Erosion, Drainage density, Hydrogeology, Structural geology, Superimposed drainage, Terrain analysis, Topography, Weathering, Pleistocene epoch, Deserts, Sands, Paleoclimatology.
Identifiers: *Africa, *Kalahari Desert, *Sahelian zone, *Alab dunes, *Calcretes.

The Kalahari Desert is grass and tree-covered with a mean annual rainfall of 150-200 millimeters but with consistent year-round water deficits due to transpiration losses. A sequence of climatic changes have occurred since the Pleistocene through the present which have strongly influenced its morphology. These changes may be similar to but more striking than those of the Sahelian Zone which lies between the Saharan and Sudan Zones. The geomorphology of the area was studied by the use of aerial photographs in an effort to trace past climatic changes. The data suggest a number of tentative theories: (1) Alab dunes, running about parallel to present day winds represent a period when annual rainfall was probably much less than one-half present rainfall; (2) Massive underlying calcretes were probably deposited since the Pliocene during various semiarid climates similar to the present; (3) A more humid period followed in which extensive rivers probably flowed toward the Ngami and Mababe depressions, guided by alab dunes, creating extensive series of lakes; (4) A more arid period followed, probably creating dunefields and sand ridges. It is concluded that the unorganized drainage networks of the present Kalahari Desert and the Sahelian Zone are characteristic of areas where aridity has been replaced by more humid conditions. (Casey-Arizona)

SEDIMENT DISTRIBUTION AND HYDRODYNAMICS SACO RIVER AND SCARBORO ESTUARIES, MAINE,
Massachusetts Univ., Amherst. Coastal Research Group.
Stewart C. Farrell.
Available from the NTIS as AD 709 145, $3.00 in paper copy, $0.95 in microfiche. June 1970, 142 p. Contribution No. 6-CRG. NR388-084.
Identifiers: *Hydrology, Maine, *Rivers, Sedimentation, Distribution, Geologic age determination, Environment, Sand, Particle size, Saco River estuary, Scarboro estuary, *Estuarine hydrography, *Holocene sedimentation.

Using a combination of field observations and measurements and laboratory investigation of sampled materials, this study is an attempt to discover the processes responsible for the formation of the assemblage of Holocene sediment bodies present in the Saco Bay, Maine, area. By interpreting the processes and the significant features resulting from them in this and other areas currently under study by the University of Massachusetts Coastal Research Group, a clearer picture of the complex pattern of coastal sand-body development, it is anticipated, will emerge.

DYNAMIC PROPERTIES OF IMMERSED SAND AT VIRGINIA BEACH, VIRGINIA,
Virginia Inst. of Marine Science, Gloucester Point.
Wyman Harrison, and Morales-Alamo Reinaldo.
Available from NTIS as AD-459 520, $3.00 in paper copy, $0.95 in microfiche. December 1964. 52 p, Army Coastal Engineering Research Center. Technical memorandum No. 9.
Identifiers: *Beaches, Sand, *Sand, Sedimentation, Sampling, Particle size, Ocean waves, Wind, Viscosity, Temperature, Sea water, Drag, Reynolds number, Velocity, Mathematical analysis, Beach erosion, Virginia Beach.

On March 25, 1963, 219 sand samples were taken from the shoaling-wave, breaking-wave, swash-backwash, and foreshore zones of the beach. The following measurements were used to describe the properties of the samples: mean settling velocity in nature (as determined with a woods hole rapid sand analyzer and a special set of curves for settling velocity as a function of temperature), mean reynolds number (in nature), and mean drag coefficient (for an infinite fluid under natural conditions). Corey's (1949) shape factor and the dynamic shape factor of Briggs, Et Al (1962) were calculated and compared; the Corey shape factor was used in calculating mean settling velocity. Data for mean and median grain size (in nominal diameter) and sorting for each sample are presented.

BEACH PROFILE AS AFFECTED BY VERTICAL WALLS,
California Univ., Berkeley. Hydraulic Engineering Lab.
Abdel-Latif Kadib.
Available from NTIS as AD-420 424, $3.00 in paper copy, $0.95 in microfiche. June 1963. 49 p. Corps of Engineers, Beach Erosion Board Technical Memorandum 134.
Identifiers: *Beaches, Erosion, *Levees, Models (Simulations), Water, Control, Walls, Construction, Soil mechanics, Breakwaters, Beach erosion, Shore protection.

Results of a laboratory investigation of some aspects of the flow characteristics and wave attack at sand beaches protected by a vertical seawall are reported. The effects of the top elevation of the vertical wall, bed material characteristics, and different wave scale ratios were also investigated. Some conclusions are drawn regarding relative wall height and beach profile stability in front of and behind the wall.

BLACK SEA: RECENT SEDIMENTARY HISTORY,
Woods Hole Oceanographic Inst., Woods Hole, Mass.
David A. Ross, Egon T. Degens, and Joseph MacIlvaine.
Science, Vol 170, No 3954, p 163-165, October 9, 1970. 3 p, 4 fig, 9 ref. NSF Grant GA-1659.

Descriptors: *Sediment distribution, *Recent epoch, *Environmental effects, *Sedimentation rates, Sedimentary basins (Geological), Fresh water, Sea water, Organic matter, Carbonates, Carbon radioisotopes, Cores.
Identifiers: *Black Sea, Sedimentary history.

To learn the origin and history of recent sediments, a detailed oceanographic survey of the Black Sea was made in 1969 during which 60 piston, gravity, and kasten cores were obtained and studied. This article describes some of the findings. Three distinct sedimentary units can be correlated throughout the basin. Carbon-14 ages help to define the recent sedimentary history. An upper unit 30 cm thick consists of microlaminated layers of light carbonate material with intervening darker layers containing more organic material. The second unit, about 40 cm thick, has an extremely high content of organic matter. The lowest unit consists of a sequence of alternating light and dark lutite; the organic content is higher in the dark layers and carbonate content is higher in the light layers. The sedimentary sequences reflect environmental changes that occurred during the time the Black Sea was a freshwater lake when cut off from the Mediterranean (20,00 to 10,000 yr ago) by the most recent worldwide lowering of sea level and later ice melting period, and after reconnection (7,000 to 12,000 yr ago) when salt water again entered the Black Sea and slowly increased salinity. Sedimentation rates are high in eastern parts of the basin bordering mountains but relatively low in western parts where sediments are trapped in river estuaries and on the broad shelf area. (Lang-USGS)

A PRELIMINARY INVESTIGATION OF SUSPENDED SEDIMENTS IN KAINJI LAKE, NIGERIA,
Ife Univ. (Nigeria).
Olayinka L. Asseez.
Bulletin International Association of Scientific Hydrology, Vol 15, No 3, p 61-70, September 1970. 10 p, 5 fig, 4 tab, 11 ref.

Descriptors: *Sedimentation, *Reservoirs, *Reservoir silting, Sediment yield, Suspended load, Sediment transport, Silting, Streamflow, Discharge (Water), Sediment discharge.
Identifiers: Kainji Lake (Nigeria), Niger River.

The suspended load of eight major western rivers flowing into Kainji Lake, Nigeria was determined as a part of the investigation of the suspended sediment of the reservoir. On whole the results of this study is in agreement with the previous conclusion that the sediment load of the Niger was low. A range of 29-221 ppm was observed within the reservoir whereas the concentration in the inflowing rivers varied from 122-953 ppm. It was however not possible to determine the total sediment load because discharge data were lacking. The overall rate of silting is slow but locally high rate of sediment supply gives cause for anxiety regarding the possible growth of deltas at the mouths of the river. (Knapp-USGS)

BED LOAD DISCHARGE OF THE RIVER TYNE, ENGLAND,
Newcastle-upon-Tyne Univ. (England). Dept. of Civil Engineering.
T. C. Muir.
Bulletin International Association of Scientific Hydrology, Vol 15, No 3, p 35-39, September 1970. 5 p, 3 fig, 1 tab, 13 ref.

Descriptors: *Bed load, *Alluvial channels, *Sediment transport, Sampling, Surveys, Equations, Sediment discharge, Suspended load, Discharge (Water), Sediment load, Duration curves, Particle size, Stage-discharge relations.
Identifiers: Meyer-Peter and Muller formula, England, River Tyne.

Bed load movement was studied at the Bywell cableway gaging station on the River Tyne in Northern England. Bed load rating curves are derived using several bed load discharge formulae. Average annual bed load discharges are computed from long-term flow records. The results of the Meyer-Peter and Muller equation, showing an average annual bed load discharge of 14,900 tons (approximately 11% of the average annual suspended sediment load), are considered to be the most reliable. (Knapp-USGS)

FACTORS CONTROLLING THE GEOMETRY OF FLUVIAL MEANDERS,
East Pakistan Univ., of Engineering and Technology, Dacca. Dept. of Civil Engineering.
M. Shahjahan.
Bulletin International Association of Scientific Hydrology, Vol 15, No 3, p 13-24, September 1970. 12 p, 9 fig, 1 tab, 15 ref.

Descriptors: *Meanders, *Channel morphology, *Sediment transport, Alluvial channels, Sedimentation, Discharge (Water), Streamflow, Velocity, Sediment load, Bed load, Slopes, Sediment discharge.
Identifiers: Meander geometry.

The geometry of a meandering stream depends strongly on the relative stream size, on the valley slope, Sv, and on the charge, Qs/Q, where Q and Qs are the fluid and sediment discharges respectively, and D is the mean sediment size. The geometry depends less strongly on the relative settling size of sediment. For constant values of Q, Sv and D, the effect of increase of charge reduces the meander length, ML, and the mean channel surface width, B, whereas meander width, MB, bend radius, RM, and mean channel depth, H, increase. For a constant value of relative stream size the values of ML, MB, RM, and B increase with the increase of valley slope but the value of H tends to decrease. (Knapp-USGS)

MEANDER GEOMETRY ARISING FROM VARYING FLOWS,
Hydraulics Research Station, Wallingford (England).
Peter Ackers, and F. G. Charlton.
Journal of Hydrology, Vol 11, No 3, p 230-252, September 1970. 23 p, 6 fig, 1 tab, 24 ref.

Descriptors: *Channel morphology, *Meanders, *Alluvial channels, *Hydraulic models, Sands, Discharge (Water), Sediment transport, Sedimentation, Bed load, Streamflow, Stage-discharge relations, Geomorphology, Channel erosion, Scour, Regime, Model studies, Steady flow, Unsteady flow.
Identifiers: Meander geometry.

Experimental research on meandering channels, carried out in a large bed of sand at Wallingford, included tests with cyclic varying discharges. Comparisons of meander length with experiments under steady conditions provide information on the 'formative' or 'dominant' discharge. Field data used for comparison include mean discharge, average flow in the month of maximum flow, mean annual flood, and bank-full discharge. This tends to confirm bank-full flow as the condition which generates the characteristic meander length. (Knapp-USGS)

COMPUTATION OF STABLE CANAL BEDS IN WEAK, FINE-GRAINED GROUND,
N. V. Lapturev.
Translation from Gidrotekhnika i melioratsiya, No 10, p 26-33, 1969. Soviet Hydrology: Selected Papers, Issue No 3, p 320-327, 1969. 8 p, 1 fig, 2 tab, 7 ref.

Descriptors: *Streambeds, *Channel flow, *Hydraulics, *Sedimentation, *Mathematical studies, Equations, Deposition (Sediments), Particle size, Sedimentary structures, Sediment distribution, Erosion, Foreign projects, Alluvial channels, Scour, Stream erosion.
Identifiers: Stable streambed, Fine-grained bottom, USSR.

Methods for computing parameters in determining particle size of stream (or canal) beds are presented. The main and determining factor in the formation of a river channel is water discharge with which all the other hydraulic elements are closely associated. In the particular case of canals of irrigation systems on lowland rivers investigated from a laboratory analysis of field observations, equations were formulated from relationships for stream depth, flow velocity, channel width, wetted perimeter, hydraulic radius, channel slope, maximum stream depth, the Chezy coefficients, and the fall velocity of the particles in the stream. Computations agree reasonably well with the results of field observations (which are included in the report). The methods recommended by existing standards for computing the beds of canals have significant shortcomings. In some cases, as when canals cross noncohesive fine-grained ground, these shortcomings can lead to inaccurate solutions, excessive construction work, and great costs in maintaining the canal beds in good repair during operation. The relationships obtained here for computing erosion- and silt-stable canal beds will not only simplify the method of hydraulic computations, but improve its accuracy. (Woodard-USGS)

SOLUBILITY AND HYDROLYSIS OF ALUMINUM IN SOIL SOLUTIONS AND SATURATED-PASTE EXTRACTS,
Auburn Univ., Ala. Dept. of Agronomy and Soils.
John S. Richburg, and Fred Adams.
Soil Science Society of America Proceedings, Vol 34, No 5, p 728-734, September-October 1970. 7 p, 2 fig, 7 tab, 32 ref.

Descriptors: *Hydrolysis, *Aluminum, *Soil chemistry, Solubility, Chemical reactions, Computer programs, Hydrates, Molecular structure, Soil analysis, Soil structure.
Identifiers: Aluminum ion activities (Soils), Cations, Soil chemical activity.

Three Coastal Plains soils with different 'critical' pH values for maximum cotton yields in field experiments were analyzed for Al solubility. Fertilized soil was used to verify critical pH by a root-growth experiment in a growth-chamber, as well as to obtain displaced soil solutions and water extracts from saturated pastes. Extracts were also obtained from saturated pastes made with 0.01M and 0.05M KCl and with 0.0033M and 0.0167M CaCl2. Solutions were analyzed for pH, Ca, Mg, Mn, K, NH4, Al, and SO4; the remaining ions required for electrical neutrality were assumed to be Cl and NO3. A computer program was used to solve for ion activities and ion-pair concentrations, including various Al-ion species. Calculated values were much lower for polymeric hydrolysis than for monomeric hydrolysis. (Knapp-USGS)

OXYGEN AND HYDROGEN ISOTOPE RATIOS OF MONTHLY COLLECTED WATERS FROM NASUDAKE VOLCANIC AREA, JAPAN,
Tokyo Univ. of Education (Japan). Dept. of Chemistry; and Tokyo Univ. (Japan). Ocean Research Inst.
Minoru Kusakabe, Hiroaki Wada, Sadao Matsuo, and Yoshio Horibe.
Journal of Geophysical Research, Vol 75, No 30, p 5941-5951, October 20, 1970. 11 p, 9 fig, 2 tab, 24 ref.

Descriptors: *Stable isotopes, *Deuterium, *Thermal water, *Volcanoes, Magmatic water, Hot springs, Water chemistry, Water sources, Steam, Radioisotopes, Surface waters, Rainfall, Precipitation (Atomospheric), Tracers, Geochemistry, Groundwater movement.
Identifiers: *Oxygen isotopes, *Fumaroles.

Monthly variation of oxygen isotopes of two fumarolic condensates, five hot spring waters, two stream waters, and meteoric precipitation at the Nasudake volcanic area of Japan was measured. There was no remarkable variation with time in the isotopic ratios of the samples except for meteoric precipitation and for one of the hot spring waters. The delta D and delta O-18 of meteoric precipitation showed seasonal change with summer maximum and winter minimum. The D and O-18 of the stream waters and two of the hot spring waters were identical with those of average precipitation. The residence time of precipitation water under the ground was calculated to be not shorter than a few years. Precipitation did not directly affect the isotopic ratios of volcanic waters. Deuterium content of thermal waters was found to be higher than that of surface waters by 7 parts per thousand on the average. This slight enrichment of deuterium was inferred to be due to subsurface clay formation. (Knapp-USGS)

AN AIRBORNE MEASUREMENT OF THE SALINITY VARIATIONS OF THE MISSISSIPPI RIVER OUTFLOW,
Lockheed Electronics Co., Houston, Tex., and National Aeronautics and Space Administration, Houston, Tex.
J. D. Droppleman, R. A. Mennella, and D. E. Evans.
Journal of Geophysical Research, Vol 75, No 30, p 5909-5913, October 20, 1970. 5 p, 5 fig, 1 tab, 2 ref.

Descriptors: *Salinity, *Mississippi River, *Remote sensing, *Microwaves, *Electromagnetic waves, Radio waves, Radiation, Aircraft, Instrumentation, Radar, Measurement.
Identifiers: Passive microwave measurements, Radiometry.

Passive microwave radiometric measurement of salinity variations were made at the south and southwest passes of the Mississippi River on September 27, 1969. The passive microwave system can measure radiometric energy in four bands centered on 1.4, 10.6, 22.2, and 31.4 GHz. No radiometric temperature change (within instrumental limits) was observed with the 10.6-, 22.2-, or the 31.4-GHz radiometers. A radiometric change of 13--18 deg K was observed with the 1.4-GHz radiometer. This observed change and the absence of an observed change by the other channels agrees (within experimental limits) with the theoretically predicted radiometric temperature variation for water at 25 deg C. This measurement demonstrates that an airborne passive microwave radiometer operating at 1-1.5 GHz can rapidly measure salinity and variations in salinity over large areas. (Knapp-USGS)
W71-00562

REMOTE ANALYSIS OF FLUORESCENCE BY A FRAUNHOFER LINE DISCRIMINATOR,
Geological Survey, Washington, D. C.; and Perkin-Elmer Corp., Norwalk, Conn.
George E. Stoertz, William R. Hemphill, and David A. Markle.
Reprint of Paper presented at Marine Technology, 1970, Marine Technology Society 6th Annual Conference, Wash, DC, June 29-July 1, 1970. Vol 2, 22 p, 13 fig, 1 tab, 30 ref.

Descriptors: *Remote sensing, *Fluorometry, *Dye releases, *Tracking techniques, Optical properties, Fluorescence, Instrumentation, Photometry, Path of pollutants, Dispersion, Water pollution sources.
Identifiers: Rhodamine WT.

A prototype Fraunhofer line discriminator (FLD), an optical instrument for remote detection of substances that fluoresce when irradiated by sunlight, operates at the sodium D2 line (5890 A), automatically measuring solar-stimulated fluorescence against a background of reflected sunlight. Over water it functions as an airborne or shipboard fluorometer, measuring substances that fluoresce amber, such as rhodamine dyes. The FLD detected Rhodamine WT in a tank of water 1/2-meter deep in concentrations as small as 1 ppb. Shipboard and helicopter tests show that the dye normally can be monitored in concentrations less than 5 ppb, whether in clear river water, moderately turbid marine coastal water, or highly turbid estuaries. Tests to altitudes of 5,000 feet show little loss of sensitivity. Applications of the FLD include sensing fluorescent dye in studies of current dynamics and dispersion. Use of other lines may permit monitoring of oil spills, detergents, algal blooms, distribution of phytoplankton, and fluorescent chemicals such as lignin sulfonates, associated with pulp- and paper-mill wastes. PLAYA WATER QUALITY CHANGES WITH TIME AND EFFECTS ON CLARIFICATION,
Agricultural Research Service, Bushland, Tex. Soil and Water Conservation Research Div.
Oliver R. Lehman, and Victor L. Hauser.
Water Resources Research, Vol 6, No 5, p 1420-1423, October 1970. 4 p, 2 tab, 5 ref.

Descriptors: *Playas, *Water quality, *Water resources development, *Artificial recharge, Water conservation, Turbidity, Nutrients, Irrigation water, Water sources, Water analysis, Water treatment.
Identifiers: Water clarification.

An estimated 2 to 5 million acre-feet of runoff water accumulates annually in playas on the semiarid southern high plains; however, development of this large potential water source has been impeded by lack of water quality data. Most of the water is lost by evaporation, and timely utilization is essential. Therefore, a particular need exists for quality data on freshly impounded water. Water from five playas was sampled and analyzed at intervals for 24 days following runoff from a single storm. Chemical analyses showed playa waters were excellent for irrigation; however, adequate economical clarification is probably needed for such projects as direct aquifer injection. With aging, less synthetic cationic polyelectrolyte and more alum was required for water clarification. Initially low nitrate and chemical oxygen demand values decreased with time. (Knapp-USGS)

SILICA IN THE GROUNDWATERS OF PETROLEUM RESERVOIRS IN THE PRE-CARPATHIAN DOWNWARP,
Akademiya Nauk URSR, Lvov. Inst. of Geology and Geochemistry of Fossil Fuels.
V. M. Shchepak, and V. I. Migovich.
Translated from Geokhimiya, No 11, p 1397-1404, 1969. Geochemistry International, Vol 6, No 6, p 1093-1100, 1969. 8 p, 7 tab, 7 ref.

Descriptors: *Water chemistry, *Silica, *Oil fields, *Geochemistry, *Exploration, Surveys, Oil industry, Subsurface investigations, Chemical reactions, Aquifers.
Identifiers: *Geochemical prospecting, *USSR, Carpathian downwarp.

Silica content was investigated in highly mineralized connate waters related and unrelated to the petroleum deposits of the Pre-Carpathian downwarp. It was found that petroleum accumulations are surrounded by waters with relatively low silica content; values are nearly all less than 4 mg/liter. This fact may be used as an additional hydrochemical indicator in the search for gas and petroleum-bearing structures in Pre-Carpathia and other petroliferous regions. (Knapp-USGS)
W71-00612

A POLAROGRAPHIC TECHNIQUE FOR THE MEASUREMENT OF DISSOLVED SULPHIDE IN WATERLOGGED SOILS,
University Coll. of South Wales and Monmouthshire, Cardiff. Dept. of Botany.
W. Armstrong.
Journal of Soil Science, Vol 18, No 2, p 282-288, September 1967. 7 p, 3 fig, 10 ref.

Descriptors: *Polarographic analysis, *Sulfides, *Saturated soils, Electrodes, Temperature.
Identifiers: Dropping mercury electrode, Saturated calomel electrode, Agar-KCl bridge.

Soil solution is expressed from cores removed from the soil in a Hiller-type borer, and transferred to tubes containing pyrogallol and NaOH. A current-voltage curve for each sample is then obtained using the dropping mercury electrode in conjunction with a saturated calomel electrode. The current in the plateau region of a curve is proportional to the sulfide concentration, and after volume and temperature corrections the sulfide concentration

in a sample can be read from a previously prepared calibration curve. The possibility of sulfide loss from the samples before analysis has been found to be slight. Details of construction, and calibration of the dropping mercury electrode using standard Na2S solutions, are included in the description of the technique and apparatus. The inclusion of such minor modifications as (a) the insertion of a condenser across the microammeter terminals to dampen the large current oscillations produced by the dropping mercury electrode, and (b) the inclusion of a switch to allow reversal of polarity at the microammeter, enabled a circuit of the type currently used for soil oxygen diffusion measurements to be used also for sulfide estimation. (Woodard-USGS)

FACTORS AFFECTING THE TRANSFER OF MATERIALS BETWEEN WATER AND SEDIMENTS,
Wisconsin Univ., Madison. Water Resources Center.
G. Fred Lee.
Available from NTIS as PB-195 220, $3.00 in paper copy, $0.95 in microfiche. Wisconsin Univ, Madison, Water Resources Center, Eutrophication Information Program, Literature Review No 1, 1970. 50 p, 120 ref. OWRR Project W-117 (1614) (1).

Descriptors: *Sediments, *Sedimentology, Sediment-water interfaces, Particle size, Lake soils, Lakes, Phosphorus, Chemical properties, Eutrophication, Nitrogen, Hydrodynamics, Oxidation-reduction potential, Sorption.
Identifiers: *Phosphate buffer, *Phosphate levels, Biological factors, Acid-base, Precipitation-solubilization, Complexation, Exchange reactions.

A general description of the possible factors involved in various kinds of exchange reactions between waters and sediments is presented. Basically, the exchange reactions have been broken down into physical control, where hydrodynamics plays the important role in determining the rate of exchange, and biological and chemical control where the processes bringing the material onto or from the surface of the solid are the major function. Knowledge of exchange reactions and the factors influencing them appears to be extremely meager. In fact, it is almost impossible to make any predictions about the magnitude or rate of exchange for any species in a system that has not been investigated. Hopefully, current research in this area will help to eliminate this deficiency in knowledge within a few years. (Lee-Wisconsin)
W71-00618

ANALYSIS OF TIME-VARIANT BEHAVIOR OF WATER CHEMISTRY,
Nevada Univ., Reno. Desert Research Inst.
John V. A. Sharp.
Available from NTIS as PB-195 305, $3.00 in paper copy, $0.95 in microfiche. Preprint No 71, Paper H-23, presented at 51st Annual Meeting of American Geophysical Union, Washington, DC, April 21, 1970. 10 p, 4 fig, 3 ref. OWRR Projects A-017-NEV (3) and A-024-NEV (3).

Descriptors: *Water quality, *Time series analysis, *Sampling, *Water chemistry, Frequency analysis, Statistical methods, Stochastic processes, Streamflow, Water pollution sources, Seasonal, Data collections.
Identifiers: Water quality variation.

Time-variant behavior of water chemistry is controlled by internal factors of a hydrologic system and by external stimuli. Periodic sampling of water provides data to compute this variation. The observed time variation can be modeled as a discontinuous time series, composed of time-systematic and stochastic components. The stochastic component is a residual attributed to random fluctuations in the parent water chemistry and in sampling analysis. Nonparametric tests confirm and amplify results of serial correlation. Tests are selected for their discrimination against specific time-variant alternatives to constant behavior. Several examples demonstrate the interplay between serial correlation and nonparametric techniques and some of the interpretative difficulties met in practice. (See also W71-00630). (Knapp-USGS)
W71-00629

TIME-DEPENDENT BEHAVIOR OF WATER CHEMISTRY IN HYDROLOGIC SYSTEMS,
Nevada Univ., Reno. Desert Research Inst.
John V. A. Sharp.
Available from NTIS as PB-195 306, $3.00 in paper copy, $0.95 in microfiche. Preprint No 68, Desert Research Institute, Nevada University, May 1969. 11 p, 9 fig. OWRR Project No A-017-NEV (2), and A-024-NEV (2).

Descriptors: *Water quality, *Variability, Sampling, Fluctuation, Statistics, Data collections, Hydrologic data, Water chemistry, Water pollution sources, Path of pollutants.
Identifiers: Water quality variation.

Water chemistry at a pount in a hydrologic system varies continuously with time. In order to characterize this series it is necessary to monitor the water chemistry, either on a discontinuous basis, for example, discrete monthly sampling, or on a continuous basis. A general model of the resulting time-dependent behavior is the sum of two components. One component is described deterministically by a mathematical function of time which is the basis for the behavioral classification. The second component is unsystematic, fluctuating randomly. This 'noise' is an unresolved mixture of random variation in both chemistry of the water and sampling/analysis procedures. In practice, the unsystematic omponent is the residual from the systematic and describes some probability distribution. The unsystematic component is regarded as superimposed on the systematic component and to a varying degree obscures it. Combinations occur of trend, cyclical, and oscillatory behavior. Some examples of time-dependent behavior as exhibited by water points in Nevada and eastern California are discussed. (See also W71-00629). (Knapp-USGS)

OXYGEN PRODUCTION IN EXPERIMENTAL CHANNELS,
Michigan Univ., Ann Arbor. Dept. of Environmental Health.
P. G. Meier, J. J. Gannon, and M. E. Bender.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 2, 1970. Preprint. 17 p, 15 fig, 4 tab, 20 ref.

Descriptors: *Oxygen, *Streams, *Algae, Velocity, Light, Biomass, Respiration, Photosynthesis, Dissolved oxygen, Reservoirs, Aeration, Plant growth, Chlorophyll, Phytoplankton, Periphyton, Model studies, Hydrologic models, Simulation.
Identifiers: Oxygen deficit, Oxygen production.

Two levels of each variable--velocity, light, biomass, and oxygen deficit--were incorporated into a factorial design to determine their effects on algal (attached and free-floating) oxygen production and respiration in flowing systems. The dissolved oxygen concentration was depressed in river water, stored in reservoirs and passed through channels. Increase in dissolved oxygen concentration was used to calculate photosynthetic contribution above physical reaeration. Data indicated that effects of light and growth and their interactions were highly significant while no significant effects of high and low oxygen deficit and high and low current velocity were observed. Flow was the only variable in later experiments and its influence on biomass, chlorophyll concentration, respiration, and oxygen production was investigated. Results indicated that their amounts were as great if no greater in the low as in the higher velocities, although more time was required for biological equilibrium. Effect of light on oxygen production was under observation. In velocities .25 through 1.4 fps, oxygen production and biomass accrual of attached algae vary insignificantly. A total oxygen asset of approximately 2 milligrams dissolved oxygen of milligram of chlorophyll a per day was calculated. (Jones-Wisconsin)
W71-00660

PHOTOSYNTHESIS AND ZONATION OF FRESHWATER MACROPHYTES. I. DEPTH DISTRIBUTION AND SHADE TOLERANCE,
Saint Andrews Univ. (Scotland). Dept. of Botany.
D. H. N. Spence, and Jean Chrystal.
New Phytologist, Vol 69, No 1, p 205-215, 1970. 5 fig, 5 tab, 17 ref.

Descriptors: *Photosynthesis, *Fresh water, Depth, Lakes, Oxygen, Productivity, Light intensity, Chlorophyll, Swamps, Ecosystems, Laboratory tests.
Identifiers: *Macrophytes, Potamogeton praelongus, Potamogeton obtusifolius, Zonation, Potamogeton natans, Potamogeton polygonifolius, Potamogeton z Zizii, Myriophyllum spicatum, Myriophyllum gramineus.

The effects of varying light intensity upon rates of photosynthesis by certain species of submerged higher plants are described. The mean, range, and standard deviation are given of the depths of water above the soil surface in which a number of Potamogeton species occur in Scottish lochs. Sun leaves of these species were produced in unscreened containers in a glasshouse and their rates of net oxygen production were measured at irradiances of from 1.34 to 7.08 calories/square centimeter per hour in a Warburg apparatus, using Warburg buffer No 11 as bathing solution. Using only leaves of species of which the rates appeared to be unaffected by buffer solution during the experiments, it was shown that the shade tolerance of these leaves is correlated with the natural depth distribution of the species. This valid contrast in inherent photosynthesis response between some deep water species (for example, P praeongus, P obtusifolius) and some shallow water species (P polygonifolius) indicates that light may be as important as substrate or competition in controlling the zonation of freshwater macrophytes. CHANGE OF C/N RATIO DURING THE COURSE OF DEVELOPMENT OF SPHAEROMA SERRATUM (CRUSTACEAN ISOPODE) (IN FRENCH),
Centre d'Oceanographie, Marseille (France). Station Marine d'Endoume.
Pierre Kerambrun.
Comptes Rendus Academie des Sciences, Paris, Vol 270, No 4, Serie D, p 635-637, 1970. 2 fig, 3 ref.

Descriptors: *Isopods, *Crustaceans, Carbon, Nitrogen, Marine animals, Benthic fauna.
Identifiers: *Carbon:nitrogen ratio, Sphaeroma serratum, Sexual activity, T-test, Gulf of Marseille.

Determination of carbon, hydrogen, and nitrogen in tissues of Sphaeroma serratum in different stages of development revealed that carbon/nitrogen ratio fluctuates with the weight of organisms. The carbon/nitrogen ratio of young isopodes is about 6.3; it increases to the maximum of 6.8 when the organisms attain a dry weight of approximately 15 milligrams. Further growth induces a decrease of the carbon/nitrogen ratio which in specimens exceeding 30 milligrams drops to the original value of 6.3. This decrease, coinciding with the period of max-

mum sexual activity, is largely due to the augnented content of nitrogen. (Wilde-Wisconsin)

EXPERIMENTAL STUDIES OF THE TURNOVER OF PHOSPHATE IN MARINE ENVIRONMENTS,
Georgia Univ., Athens. Dept. of Zoology; and Georgia Univ., Sapelo Island. Marine Inst.
Lawrence R. Pomeroy.
Radioecology, Proceedings of the 1st National Symposium on Radioecology, Colorado State University, Fort Collins, September 10-15, 1961. New York, Reinhold, 1963. p 163-166, 5 fig, 1 tab, 2 ref.

Descriptors: *Phosphates, *Sea water, *Turnovers, Phosphorus radioisotopes, Tracers, Photosynthesis, Estuarine environment, Bacteria, Cycles, Seasonal, Radioactivity, Plankton, Detritus, Suspended load, Georgia, Light, Salt marshes, Brackish water.
Identifiers: *Short-term phosphate turnover, Antibiotics, Methylene blue, Gulf Stream, Inorganic solids, Phosphorylation, Doboy Sound (Ga), Sapelo Island (Ga), Kryptoperidinium, Nostocaceae, Altamaha River (Ga).

An understanding of the phosphorus cycle requires a critical examination of the short-term events upon which seasonal cycles are balanced. Short-term events may be physical or biological; they may be sorption reactions or may involve active uptake and release of phosphate by living organisms. An attempt is made to separate experimentally the physical from the biological processes, to evaluate their relative importance in the short-term turnover of phosphate in natural waters, and to make some preliminary attempts to identify the processes involved. The addition of methylene blue and cyanide to natural waters blocks the short-term turnover of phosphate between water and suspended solids; the turnover is therefore believed to involve biological processes, probably phosphorylation. In darkness the turnover rate of phosphate is sometimes reduced, suggesting that photosynthetic organisms can play a significant role in phosphate turnover, perhaps in proportion to their abundance. Addition of antibiotics to sea water and estuarine water may inhibit the release of phosphates from suspended solids, but often has little effect. Therefore, the role of bacteria in phosphate turnover may vary greatly and may depend on the size or character of the bacterial flora. (Jones-Wisconsin)

CONCENTRATIONS OF PARTICULATE IRON IN ATLANTIC OPEN-OCEAN WATER,
Rhode Island Univ., Kingston. Narragansett Marine Lab.
Peter R. Betzer, and Michael E. Q. Pilson.
Journal of Marine Research, Vol 28, No 2, p 251-267, May 15, 1970. 17 p, 2 fig, 4 tab, 18 ref, append. ONR Contract No 396 (08).

Descriptors: *Suspended load, *Iron, *Sea water, *Atlantic Ocean, Spectrophotometry, Sampling, Depth, Methodology, Geochemistry, Biochemistry, Diatoms, Phytoplankton, Reviews.
Identifiers: *Particulate iron concentrations, Caribbean Sea, Atomic absorption spectroscopy.

Measurements of particulate iron concentrations by atomic absorption spectroscopy have been carried out on samples from the western Atlantic Ocean and the Caribbean Sea. The average of 184 iron determinations on shallow open-ocean water (o-300 m) was 0.177 micrograms per liter; the average of 112 determinations on deep water (500-7535 m) was 0.255 micrograms per liter. These averages are lower than previous estimates by an order of magnitude or more. Spectrophotometric and atomic-absorption analyses carried out on a set of duplicate samples from the surface water of the Puerto Rican Trench indicate that the method of analysis is not the reason for the large discrepancy observed in the concentrations of particulate iron. Included in the report are related tables of data, and a map of sample collection sites. (Woodard-USGS)

STUDY AND INTERPRETATION OF THE CHEMICAL CHARACTERISTICS OF NATURAL WATER,
Geological Survey, Washington, D.C.
John D. Hem.
For sale by the Superintendent of Documents, U S Government Printing Office, Wash, D C, 20402 - Price $2.25 per copy. Geological Survey Water-Supply Paper 1473, 1970 (Second Edition). 363 p, 51 fig, 2 plate, 29 tab, 416 ref.

Descriptors: *Water quality, *Water chemistry, *Water analysis, *Sampling, Water structure, Radioactivity, Solutes, Aqueous solutions, Chemical reactions, Thermodynamics, Water pollution sources, Pollutant identification, Biochemistry, Weathering, Leaching, Laboratory tests, Analytical techniques, Hydrologic cycle, Chemistry of precipitation, Geochemistry.
Identifiers: Chemistry of natural water (Textbook).

This textbook has two principal objectives: (1) to outline the principles and processes, chemical and environmental, which shape and control the chemical composition of natural water, and (2) to discuss the chemistry of individual constituents and methods of data interpretation, and to present associated bibliographic references. The chemical composition of rocks, the ocean, and the atmosphere are significant in evaluating sources of solutes in natural fresh water. Fundamental data used in the determination of water quality are obtained by the chemical analysis of water samples in the laboratory or onsite sensing of chemical properties in the field. More than 60 constituents and properties are frequently included in water analysis. Graphing of analyses or of groups of analyses aids in showing chemical relationships among waters, probable sources of solutes, areal water-quality regimen, and water-resources evaluation. About 75 water analyses selected from the literature are tabulated to illustrate the relationships described. Relationships of water composition to source rock type are illustrated by graphs of some of the tabulated analyses. Water-quality standards for domestic, agricultural, and industrial use have been published by various agencies. Irrigation project requirements for water quality are particularly intricate. (Knapp-USGS)

THE pH OF WATER IN FLORIDA STREAMS AND CANALS,
Geological Survey, Tallahassee, Fla.
Matthew I. Kaufman.
Florida Bureau of Geology Map Series 37, 1970. 1 sheet, 6 fig, 1 map, 2 tab, 10 ref.

Descriptors: *Hydrogen ion concentration, *Surface waters, *Florida, Maps, Acidity, Streams, Canals, Discharge (Water), Streamflow, Bicarbonates, Color, Conductivity.
Identifiers: Relationship curves, Chemical characteristics.

This report presents in a succinct and usable form information on the pH of streams and canals throughout Florida as an aid to water managers, users, and planners. The variations in pH are related to environmental causes. The minimum pH of water and the range through which the pH of stream waters fluctuate in the various geographic areas is significant with respect to industrial, municipal, and recreational uses, aquatic productivity, the State of Florida's water quality such as culverts, in addition to governing the toxicity, mobility, and solubility of many compounds. CHARACTERIZATION OF BOTTOM SEDIMENTS: CATION EXCHANGE CAPACITY AND EXCHANGEABLE CATION STATUS,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Soils and Crops.
Stephen J. Toth, and Arthur N. Ott.
Environmental Science and Technology, Vol 4, No 11, p 935-939, November 1970. 5 p, 4 tab, 11 ref.

Descriptors: *Bottom sediments, *Ion exchange, *Cation exchange, *Clays, Iron, Manganese, Organic soils, Organic matter, Oxidation-reduction potential, Soil chemistry, Sampling, Rivers, Estuaries, Lakes, Reservoirs, Water chemistry.
Identifiers: Cation exchange capacity.

Two parameters, cation exchange capacity (CEC) and exchangeable cation status (ECS), were used to characterize bottom sediments collected from rivers, bays, and freshwater impoundments. It was necessary to investigate the effect of drying on CEC and exchangeable Fe and Mn to arrive at satisfactory modifications of soil techniques used for these parameters. Wide variations were obtained in CEC and ECS values for the sediments. CEC and ECS values may be utilized for determining saltwater intrusions and pollution effects. (Knapp-USGS)

BIOLOGICAL ZONATION RELATED TO GROUNDWATER DISCHARGE ALONG THE SHORE OF BISCAYNE BAY, MIAMI, FLORIDA,
Geological Survey, Miami, Fla. Water Resources Div.
F. A. Kohout, and M. C. Kolipinski.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, DC, p 488-499, 1967. 12 p, 16 fig, 1 tab, 27 ref.

Descriptors: *Discharge (Water), *Springs, *Salinity, *Ecological distribution, *Saline water-freshwater interfaces, *Florida, Barriers, Biological communities, Distribution, Spatial distribution, Groundwater movement, Water levels, Saline water intrusion.
Identifiers: Biscayne Bay (Fla).

Discharge of fresh groundwater through the littoral bottom sediments of a bay or shallow sea may produce a biological zonation. The overriding function appears to be that of dilution of the interstitial water and nearshore sea water. Zonation should exist along any shoreline where a fresh groundwater reservoir is hydraulically connected to a saltwater body through permeable bottom sediments. The hydrological factors leading to zonation are demonstrated by the resulting gradation of flora and fauna at a site near Miami, Florida. The coral, Siderastrea sideria, dropped out landward at about 700 feet from shore, where the salinity ranged from 21 to 30 ppt, and the loggerhead sponge, Sphecospongia vesparia, dropped out at 400 feet from shore where the salinity ranged from 13 to 28 ppt. The gastropods, Turbo castaneus and Columbella rusticoides dropped out in the shoreward region of freshened bay water. In contrast, the brackish forms, such as Neritina virginea and Taphromysis bowmani, decrease seaward. These distributions focus at a distance of about 300 feet from shore, which is also the distance at which the main part of the groundwater discharge terminates. (Knapp-USGS)

NUTRIENT AND PLANKTON ECOLOGY OF THE COLUMBIA RIVER ESTUARY,
Oregon State Univ., Corvallis. Dept. of Oceanography.
Lois Haertel, Charles Osterberg, Herbert Curl, Jr, and P. Kilho Park.
Ecology, Vol 50, No 6, p 962-978, 1969. 8 fig, 8 tab, 38 ref.

Descriptors: *Nutrients, *Plankton, *Ecology, *Estuaries, *Columbia River, Brackish water, Saline water, Nitrates, Phosphates, River flow, Silicates, Solar radiation, Temperature, Hydrography, Scenedesmus, Euglenophyta, Pyrrophyta, Light intensity, Rotifers, Copepods, Daphnia, Aquatic microorganisms, Oxygen, Regression analysis, Zooplankton, Phytoplankton.

Monthly samples of nutrients, phytoplankton, and zooplankton were taken from Columbia River estuary during 16 months to determine distribution with season and salinity, and interrelationships between plankton and nutrients. Nitrate and phosphate levels in river water entering the estuary are high in winter and are depleted in summer; silicate levels are high in the river water at all season. During summer upwelling season, nitrate and phosphate levels in the entering ocean water are high. Although nutrient levels in the estuary generally show linear relationship with salinity, nitrate and phosphate tend to be enriched in bottom waters of the central part of the estuary. Estuarine phytoplankton is primarily composed of freshwater species, probably representing a downstream extension of the river flora. Linear regression analysis indicates a strong correlation between phytoplankton abundance and solar radiation. Estuary zooplankton is composed of fresh water, oligohaline, and polyhaline forms. Eurytemore affinis (an oligohaline), the major zooplankter, reaches population densities of 100,000/cubic meter or more. Regression analysis indicates strong correlation between abundance of freshwater zooplankton and river temperature and close correlation between phosphate levels and Eurytemore abundance, exhibiting strong potential for zooplankton regeneration of phosphate necessary for phytoplankton growth. (Jones-Wisconsin)

ON THE STATISTICAL APPROACH TO ECOLOGICAL STUDIES OF MARINE BACTERIA (IN RUSSIAN),
Gidrometeorologicheskii Institut Odessa (USSR).
A. V. Tsyban, and V. A. Shaidman.
Doklady Academy of Sciences of USSR, Vol 188, No 5, p 1159-1162, 1969. 1 fig, 5 ref.

Descriptors: *Statistical methods, *Analysis, *Mathematical studies, *Marine bacteria, Temperature, Salinity, Distribution, Population.
Identifiers: *Prismatic ecograms, Black Sea, Thermo-halidic gradients.

The statistical method of prismatic ecograms is reported in application to the distribution of sea-inhabiting bacteria. The analysis is based on the two easily determinable parameters--temperature and salinity of water. The probability of 90% is accepted as the minimum significance for the frequency of occurrence of a species in relation to the thermo-halidic gradient. The study embraced the following heterotrophic bacteria of the Black Sea: Bacterium agile, B Liquifaciens, B galophilum, Chromobacterium aurantiacum, Pseudomonas sinuousa, Micrococcus aurantiacus, Bacillus solidus, B album, Micrococcus cinnabareus, B subtilis, M citreus, M candidus. The method is applicable for an appraisal of populations in relation to other ecological factors in any part of the biosphere. (Wilde-Wisconsin)

SAND INVENTORY PROGRAM. A STUDY OF NEW JERSEY AND NORTHERN NEW ENGLAND COASTAL WATERS,
Army Coastal Engineering Research Center, Washington, D.C.
David B. Duane.
Available from the NTIS as AD 703 583, $3.00 in paper copy, $0.95 in microfiche. Shore and Beach, October 1969, 5 p.
Identifiers: *Seacoast, Protection, *Sand, Beaches, Deposits, Stabilization, Gravel, Reflection, Maine, New Jersey, Pipes, Connecticut, Massachusetts, Coastal engineering, *Offshore sand deposits, Cape May (New Jersey), Beach stabilization, Shore protection, Pipelines.

CERC continues to seek and delineate offshore deposits of sand for beach restoration and stabilization. This Sand Inventory Program, in its exploration phase, uses seismic reflection profiles of the bottom and subbottom and also coring of the bottom. Laboratory analyses of the field data define the location, characteristics, extent, and quantity of the sand deposits that can be used for shore protection. CERC has conducted detailed exploration surveys off New Jersey, east Florida, New England, Long Island, and Norfolk, Virginia. This work covers 7,3000 miles of geophysical surveys and includes 1,037 cores and more than 5,000 sand-sample analyses. Within several miles of the shore and in water shoaler than 100 feet, the surveys revealed more than 4 million cubic yards of sand suitable for beach nourishment. In 1966, off New Jersey, the Corps of Engineers proved the practicability of recovering these sand deposits from the bottom and putting them on eroded beaches at a competitive cost. The work was accomplished by a large hopper dredge with a pump-out capability. More recently, a Federal beach near Los Angeles was artifically replenished by recovering an offshore deposit with a pipeline dredge.

HYDROGRAPHY AND HOLOCENE SEDIMENTATION OF THE MERRIMACK RIVER ESTUARY, MASSACHUSETTS,
Massachusetts Univ., Amherst. Coastal Research Group.
Allan D. Hartwell.
Available from the NTIS as AD-709 144, $3.00 in paper copy, $0.95 in microfiche. June 1970, 181 p. Contribution No 5-CRG. NR 388-084.
Identifiers: *Hydrology, Massachusetts, *Rivers, Sedimentation, Geologic age determination, Environment, Sand, Particle size, Merrimack River, *Estuarine hydrography, *Holocene sedimentation.

The Merrimack River estuary, situated on glaciated terrain along the coast of northeastern Massachusetts, is representative of the Type B estuary of Pritchard (1955). A sharp, slightly tilted boundary between salt water to the north and fresh water to the south develops during periods of normal and high runoffs. At low runoff the stratification disappears. The distribution of bottom sediments is closely related to the hydraulic circulation pattern, tidal current velocities, bottom topography, and sediment source areas. Three types of sand are present in the estuary. A yellow-orange feldspathic suite occupies the main channel. A gray feldspathic suite underlines the marshes of the lower estuary. A third sand type, which is predominantly quartz (86%) with subequal amounts of gray and yellow-orange feldspar (5%), is common in the central part of the main channel and in some tidal channels. The stratigraphy and geometry of the deposits of the fringing salt marshes document a gradual rise in sea level and infilling of an original open bay environment behind the barrier island accompanying marine transgression since late Pleistocene.

HEAVY MINERAL INVESTIGATION OF CARMEL BAY BEACH SANDS,
Naval Postgraduate School, Monterey, Calif.
Paul Adolph Griffin.
Available from NTIS as AD 704 078, $3.00 in paper copy, $0.95 in microfiche. October 1969, 45 p. MS Thesis.
Identifiers: *Minerals, California, *Beaches, California, *Minerals, Analysis, Sand, Transport properties, Sampling, Petrography, Garnet

Geologic age determination, Seascoast, Theses, Carmel Bay, California, Littoral drift, *Heavy mineral analysis, Schists, Augites.

The investigation was conducted in order to identify the heavy minerals of the beach sands of Carmel Bay, and to analyze the distribution of these minerals. Carmel Bay offers the opportunity to study heavy mineral assemblages in a small isolated bay, internally divided by a submarine canyon, containing smaller pocket beaches influenced by several geological formations, and two fresh water streams. Correlation of the heavy mineral assemblage of each sample with the sample location clearly indicate that the beach sands can be divided into two principal mineral suites that are derivatives of the geological formations in immediate contact with the individual pocket beaches. The unique nature of each suite is preserved by natural obstructions that limit the influence of littoral drift and restrict the exchange of the beach sands.

LAND AGAINST THE SEA.
Army Coastal Engineering Research Center, Washington, D.C.

Available from NTIS as AD-453 227, $3.00 in paper copy, $0.95 in microfiche. May 1964, 43 p. Miscellaneous Paper No. 4-64.
Identifiers: *Beaches, Erosion, *Seacoast, Protection, Sand, Deltas, Bulkheads, Breakwaters, Hydrology, Tides, Law, Storms, Wind, Ocean waves, Ocean currents, Reinforcing materials, *Beach erosion, *Shore protection.

Described in non-technical language are the origin and nature of our sea coasts, the forces of which those coasts are exposed, the behavior of the shores under exposure to those forces, the effects thereon of development by man, and the characteristics of methods for the protection and improvement of the shore. Also described are the roles of the local, state, and federal governments in providing for sound development, protection and improvement of the shore, and discussion of the need of long-range planning for preservation of our coastal resources.
W71-00824

SEDIMENT BALANCE OF CLYDE ESTUARY,
University of Strathclyde, Glasgow (Scotland). Dept. of Civil Engineering.
George Fleming.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY11, Paper 7676, p 2219-2230, November 1970. 12 p, 7 fig, 3 tab, 8 ref.

Descriptors: *Estuaries, *Sedimentation, *Sediment yield, Dredging, Flood control, Floods, Sediment transport, Suspended load, Navigation, Data collections, Channel improvement.
Identifiers: Sediment balance.

The development of the Clyde Estuary in Scotland is considered in relation to its sedimentation. The historical facts relating to the changes in regime of the Estuary are listed to the present (1969) conditions. The results of 3 yr of detailed research into the sediment transport conditions of the major rivers draining into the Estuary include comparison of annual sediment loads computed by two different methods, the particle size of the transported sediment, and typical graphs of the weekly suspended sediment loads transported by the rivers Clyde, White Cart, and Kelvin. The historical development of the Clyde has affected the balance between the influences of tides, streamflow, cross-section geometry and sediment load on the deposition processes in the estuary. All the sediment entering the estuary deposits in the upper reaches. Reasonable agreement exists between the amount of sediment entering the estuary and the amount dredged. The contribution of sewage discharges and spillage to the total sediment load is significant, although their influence is of more major importance as pollutants, which reduce the dissolved oxygen levels and increase the BOD within the estuary. Cessation in present dredging operations could result in the occurrence of floods once more overtopping the banks of the Clyde adjacent to Glasgow. (Knapp-USGS)

CIRCULATION IN THE AMAZON RIVER ESTUARY AND ADJACENT ATLANTIC OCEAN,
Northwestern Univ., Evanston, Ill. Dept. of Geological Sciences.
Ronald J. Gibbs.
Journal of Marine Research, Vol 28, No 2, p 113-123, May 15, 1970. 11 p, 6 fig, 3 tab, 12 ref. ONR Contract N00014-67-A-0111-0006.

Descriptors: *Saline water-freshwater interfaces, *Atlantic Ocean, *Estuaries, Ocean circulation, Ocean currents, Winds, Riverflow, Discharge (Water), Tides, Salinity, Mixing, Sea water, Freshwater, Stratification, Sampling.
Identifiers: *Amazon estuary (South America), *Isohalines, Salinometer.

A preliminary survey of the water circulation in the Amazon estuary and adjacent ocean was conducted during both low-river and high-river discharge. Results indicate that, due to the river's large discharge, no salt-water wedge (35 parts per thousand) enters the Amazon estuary during either low-river or high-river discharge. The zone of nearly vertical isohalines in the ocean near the river mouth represents an area of turbulent mixing. As the vertical mixing decreases seaward, a vertical stratification develops from about 60 km offshore during low-river discharge and from about 80 km offshore during high-river discharge. This stratification persists seaward across the continental shelf for 185 km during low-river discharge and for about 230 km during high-river discharge. During low-river discharge, an isolated freshwater lens was observed far off the French Guiana Coast. Related maps, graphs, and tables of data are included. (Woodard-USGS)
W71-00868

THE INFLUENCE OF DEPOSIT-FEEDING ORGANISMS ON SEDIMENT STABILITY AND COMMUNITY TROPHIC STRUCTURE,
Yale Univ., New Haven, Conn. Dept. of Geology and Geophysics; and Marine Biological Lab., Woods Hole, Mass.
Donald C. Rhoads, and David K. Young.
Journal of Marine Research, Vol 28, No 2, p 150-178, May 15, 1970. 29 p, 19 fig, 44 ref. NSF Grants GB 7181, GB 4509, and GB 7387.

Descriptors: *Sedimentation, *Benthos, *Foods, *Trophic level, *Bays, Sediment distribution, Suspended sediment, Mud, Sampling, Silts, Organic matter, Currents (Water), Photography, Laboratory tests.
Identifiers: *Deposit-feeding organisms, Sediment properties, Buzzards Bay (Massachusetts).

Deposit-feeding and suspendion-feeding benthos in Buzzards Bay, Massachusetts, show marked spatial separation; suspension feeders are largely confined to sandy or firm mud bottoms while deposit feeders attain high densities on soft muddy substrata. Food source and bottom stability have been investigated as potential factors effecting this trophic-group separation. Observations were made at 11 stations along two widely separated transects over bottoms ranging in texture from silt to fine and medium sand. Water depths at these stations ranged from 3 m to 20 m. SCUBA divers made many of the field observations and collected most of the samples. This study included sampling of benthic macofauna, taking bottom photographs, analyzing sedimentary structures, texture, organic content and water content of the sediments, and measuring both water currents and suspended sediment above the bottom. Laboratory experiments were also carried out to determine differential resuspension between burrowed and unburrowed muds. (Woodard-USGS)
W71-00869

HOLOCENE SEDIMENTS OF THE PARKER RIVER ESTUARY, MASSACHUSETTS,
Massachusetts Univ., Amherst. Dept. of Geology.
Joan M. DaBoll.
Available from NTIS as AD-694493, $3.00 in paper copy, $0.95 in microfiche. Massachusetts University Department of Geology, Coastal Research Group Contribution No 3-CRG, June 1969. 138 p, 42 fig, 1 plate, 1 tab, 17 ref. Contract No Nonr N00014-67-A-0230-0001.

Descriptors: *Estuaries, *Massachusetts, *Sedimentation, Sediment transport, Sands, Sedimentary structures, Tides, Tidal effects, Currents (Water), Water circulation, Streamflow, Sand waves, Ripple marks.
Identifiers: Parker River Estuary (Mass).

The Parker River estuary is situated in glaciated terrain behind Plum Island, Massachusetts. It contains a meandering main channel, large point bars on the meander loops, and a complex flood-tidal delta system. The estuary is predominantly horizontally and vertically mixed, with a tendency toward slight horizontal salinity stratification. Ebb currents are stronger than flood currents in the main channel, whereas flood currents are stronger than ebb currents in the flood bifurcations off the main channel and over the tidal flats. Large bedforms (sand waves) are abundant in the sandy areas, and reflect the current pattern to a high degree. In general, grain size decreases toward the head of the estuary. The sediment falls into two populations, one from the main body of the estuary and the other from the tidal creeks. The main body population is nearly symmetrical to coarse skewed, moderately well to well sorted, and has graphic means between 1.25 and 2.90 phi. The tidal creek population is fine to very fine skewed, poorly sorted, and has graphic means ranging from 3.00 to 7.25 phi. (Knapp-USGS)
W71-00900

03. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

COMPARATIVE COST EVALUATION OF DESALTED WATER SUPPLY VERSUS ALTERNATIVE FRESHWATER SUPPLY FROM A CONVENTIONAL SOURCE,
Southwest Research Inst., Houston, Tex.
Donald E. Morris.
Water Resources Research, Vol 6, No 5, p 1487-1495, October 1970. 9 p, 5 tab, 5 ref, append.

Descriptors: *Desalination, *Water costs, *Cost-benefit analysis, *Saline water, *Water resources development, Water supply, Groundwater, Texas, Economics, Water wells, Aquifers, Water treatment, Water distribution (Applied), Water management (Applied).
Identifiers: Saline water resources.

A costing procedure was developed in Texas so that the cost of water produced by saline water conversion could be compared to the cost of an alternative freshwater supply from a conventional source. The cost of desalted water is generally higher than the cost of water from alternative sources. For desalting, the elements included in the costing procedure were: well fields for saline feedwater supply; intake system and pumping station; pipelines; pretreatment for saline water; the desalting plant; and brine disposal. For a conventional water supply system the elements of cost included were raw water cost; well field or intake system; pipeline and required pumping stations; and a conventional water treatment plant. The final economic justification of a desalination project may include such factors as chemical quality comparisons, secondary benefits, and project life comparison to future availability of alternative supply. The Texas Water Development Board considers that desalting is a very practical solution to the water supply problems that exist in many areas of the state. (Knapp-USGS)
W71-00569

NEED FOR SALINE GROUNDWATER DATA TO ADVANCE DESALTING TECHNOLOGY,
Office of Saline Water, Washington, D.C.
W. W. Rinne.
Water Resources Research, Vol 6, No 5, p 1482-1486, October 1970. 5 p, 2 tab, 6 ref.

Descriptors: *Water resources development, *Saline water, *Desalination, Groundwater, Aquifers, Systems analysis, Economics, Optimization, Injection wells, Waste water disposal, Brines, Brine disposal, Hydrogeology, Surveys, Reviews.
Identifiers: Saline water resources.

The use of desalting technology to supplement the water resources in semiarid areas of the United States indicates the need for more detailed information on the quantity and quality of saline groundwater supplies. The disposal of brine, a waste product of all desalting processes, poses a formidable problem at inland plant sites. Present work indicates that solar evaporation ponds and subsurface injection are the preferred methods of disposal. Injection, if employed, would require more data and information on the geologic and hydrologic features of subsurface formations. Systems studies relating the intake and brine disposal facilities with the desalting process are being conducted to achieve optimum system economics. (Knapp-USGS)

A REVIEW OF DESALINATION PROCESSES AND PRODUCT WATER COSTS,
Office of Saline Water, Washington, D.C.
W. F. Savage.
Water Resources Research, Vol 6, No 5, p 1449-1453, October 1970. 5 p, 4 fig.

Descriptors: *Desalination, *Water costs, *Desalination processes, *Reviews, *Surveys, Groundwater, Surface waters, Saline water systems, Desalination apparatus, Distillation, Reverse osmosis, Electrodialysis, Economics, Desalination plants.
Identifiers: Desalination costs.

The Office of Saline Water is conducting research and development in the basic desalination process areas of distillation, membrane, and crystallation. Processes in these areas include multistage flash distillation, vertical tube evaporation, vapor compression, reverse osmosis, electrodialysis, and vacuum freezing. Developmental plants have capacities up to approximately 2.5 million gallons per day. On the basis of test results, analytical studies, and supporting investigations, water costs have been reduced significantly over the past five years. Technological developments have resulted in a 25% reduction in water costs for distillation processes desalting seawater and a reduction by a factor of 3 for reverse osmosis processes desalting brackish water, considering a fixed plant size. Coupling of improved system technology with increasing plant size results in water costs that should be competitive with alternate means of supplying freshwater to major water consuming areas. (Knapp-USGS)

REORIENTATION OF OUR SALINE WATER RESOURCES THINKING,
Geological Survey, Washington, D.C.
F. A. Kohout.
Water Resources Research, Vol 6, No 5, p 1442-1448, October 1970. 7 p, 7 fig, 18 ref.

Descriptors: *Saline water, *Water resources development, *Desalination, Economics, Water costs, Groundwater, Saline water systems, Hydrogeology, Aquifers, Surveys, Reviews, Water storage, Injection wells, Water utilization, Water sources.
Identifiers: Saline water resources.

Desalination is currently one of the most important factors that conceptually change the direction of our investigation of the nations's water resources. Desalting costs have decreased from about $5 per 1000 gallons 10 years ago to about $1 per 1000 gallons for seawater distillation today. For membrane desalting of brackish groundwater, costs now range from 40 cents to $1 per 1000 gallons. Projected costs for desalting in the mid-1970's are in the range of from 25 to 50 cents per 1000 gallons at the plant, which is in the same range as consumer costs for delivered water in large cities in 1969. Thus, saline groundwater has developed considerable intrinsic worth. In addition, the pore space occupied by the saline water can be considered as a useful medium for storing natural gas, for artificial recharge, or for storing toxic industrial wastes. Great reliance must be placed on hydrologic prediction if haphazard interference of the various uses is to be avoided. Funding must be greatly expanded to provide necessary data on saline water systems. (Knapp-USGS)

HIGH-TEMPERATURE DESALINATION PLANTS FOR NUCLEAR-POWER STATIONS,
Baldwin-Lima-Hamilton Corp., Philadelphia, Pa.
R. A. Tidball, and J. G. Gaydos.
In: Nuclear Desalination - Proceedings of International Atomic Energy Agency Symposium, Madrid, Spain, November 18, 1968, p 495-506, Paper No SM-113/26, 1969. 12 p, 11 fig, 5 ref.

Descriptors: *Desalination plants, *Nuclear power plants, Facilities, Economics, Water costs, Distillation, Water quality, Sea water, Scaling.
Identifiers: Sea-water desalination.

The maximum temperature to which the brine can be heated in a MSF plant affects both the capital costs and energy costs charged to the product water. At the OSW East Coast Test Facility fresh sea water can be treated with sulphuric acid and heated in a 'once-through' plant to 300 deg F without scale formation in the condenser tubes. When this sea water is recirculated with or without concentration, scaling will occur at temperatures above 270 deg F. A combination of a 'once-through' high-temperature effect with either a single-effect multi-stage (SEMS) flash plant or a multi-effect multi-stage (MEMS) flash plant can be utilized to reduce both capital cost and energy charges. The purity of the product water from most MSF plants varies between 5 and 100 ppm TDS. Purer water can be made at an increase in capital cost. Make-up water for modern fossil-fuel boilers or for primary systems of nuclear reactors require water containing as little as 0.05 ppm. Generally, a small part of the product water of a desalination plant is passed through a demineralizer to obtain the desired purity for make-up. However, a method is available to produce a few percent of the total product as very high-purity water. This process is presented and included in the design of the proposed plants. The capital charges, energy charges and chemical charges are compared for 150-MGD plants using the SEMS, MEMS and the 'once-through' topping plant in combination with both. (Knapp-USGS)

DESALTING SALINE GROUNDWATER FOR IRRIGATION: A CASE STUDY, BUCKEYE, ARIZONA,
Bureau of Reclamation, Denver, Colo.; and Office of Saline Water, Washington, D.C.
Harold L. Parkinson, John T. Maletic, Joseph P. Wagner, and Milton S. Sachs.
Water Resources Research, Vol 6, No 5, p 1496-1500, October 1970. 5 p, 2 fig, 2 tab, 6 ref. Bureau of Reclamation and Office of Saline Water Research agreement 14-01-0001-1241.

Descriptors: *Irrigation water, *Desalination, *Cost-benefit analysis, *Arizona, Saline water systems, Groundwater, Water wells, Salinity, Saline water, Aquifers, Water yield, Water costs, Optimization, Model studies, Economics.
Identifiers: Saline water resources.

A study was made of a 1,376 acre irrigated area in Arizona to evaluate costs and benefits associated with desalting saline groundwater from seven wells as an improved water source for irrigation. Both multistage flash distillation (MSF) and electrodialysis (ED) processes were evaluated. Well water quality varied from 1580-4600 ppm; irrigation water qualities of 400, 900, and 1500 ppm are developed. Adaptable cropping patterns are selected for maximum returns. Direct, indirect, and public benefits for the projected year of 1990 are generated by shifts to higher value crops, intensive double cropping, increased crop yields, reduced water use, reduced fertilizer costs, reduced irrigation labor, and from increased flow of farm products. Costs are based on the desalting facilities, well water collection system, product storage reservoir, conveyance and distribution system, brine disposal system, blending facilities (MSF only), gypsum addition system (ED only), and water treatment facilities. Benefit-cost ratios increased with improved water quality. The most favorable benefit-cost ratio involved use of the ED process at a water quality level of 500 ppm. (Knapp-USGS)
W71-00837

SELECTIVE ELEMENT RECOVERY FROM OIL FIELD BRINES,
Kansas Univ., Lawrence.
Ernest E. Angino.
Water Resources Research, Vol 6, No 5, p 1501-1504, October 1970. 4 p, 4 fig, 1 tab, 9 ref.

Descriptors: *Oil fields, *Brines, *Byproducts, *Brine disposal, *Desalination, Water resources development, Oil industry, Injection wells, Costs, Water chemistry, Magnesium, Sulfur, Saline water.
Identifiers: Oil field brines, Saline water resources.

More than 325 billion gallons of oil field brines are brought to the surface yearly in the United States. In many instances the salts dissolved in oil field brines could be extracted profitably, if modern extraction techniques were used or refined. Simple extraction processes for soda ash, sodium carbonate, caustic soda, magnesium and calcium sulfate, trace elements and others are available. Magnesium can be precipitated in the hydroxide form and selected trace elements can be scavenged and concentrated by ferric iron precipitation. (Knapp-USGS)
W71-00841

ST. THOMAS 2.5 MGD COMBINED DESALINATION-POWER PLANT,
Baldwin-Lima-Hamilton Corp., Wrightsville Beach, N.C.
Robert A. Tidball.
Paper presented at PURAQUA, US Exhibition and International Conference on Water Purification

and Desalination, Rome, Italy, February 17-23, 1969. 5 p, 13 fig.

Descriptors: *Desalination plants, *Water costs, *Flash distillation, *Thermal powerplants, Virgin Islands, Economics, Desalination processes, Distillation, Steam turbines.
Identifiers: St. Thomas (V. I.).

The overall heat balance material balances, and economics for the combined power and desalination station at St. Thomas, Virgin Islands are summarized. The boiler is fired with 18,140 lbs. per hour of residual fuel oil. 233,093 lbs. per hr. of the 600 psig 825 deg F. steam is piped to the turbine generator set which produced 15,500 KW of saleable power. Bleed steam is removed at 26 psig and piped to the brine heater of the desalting plant, which produces 2,500,000 gpd of potable water. The water plant was designed to produce water containing less than 10 ppm total dissolved solids, using not more than 110,000 lbs./hr. of bleed steam from the turbine. Scaling of the heat transfer surfaces in the stage condensers and the brine heater was to be prevented by the use of sulfuric acid treatment to the make-up stream. The plant was designed for a 90% availability factor. The total cost is $641,000.00 per year. During the year, the plant could produce 825,000,000 gallons of water at a cost of 78 cents/thousand gallons. (Knapp-USGS)
W71-00890

OPERATING EXPERIENCES OF ONE MGD DESALINATION PLANT ON THE RED SEA,
Baldwin-Lima-Hamilton Corp., Philadelphia, Pa.
R. A. Tidball, J. G. Gaydos, and W. M. King.
Paper presented at Symposium on Western Water and Power, Los Angeles, Calif, April 8-9, 1968, p C43-C49, 1968. 7 p, 6 fig, 2 ref.

Descriptors: *Flash distillation, *Thermal power plants, *Water costs, Economics, Distillation, Corrosion, Desalination processes, Desalination plants.
Identifiers: Eilat (Israel).

A one MGD desalting plant was erected in conjunction with a 6700 kilowatt steam generating station in Eilat, Israel. The design, manufacture and construction of the plant are discussed. The operating history and performance of the first 2-1/2 year period are summarized. The effects of brine chemistry on corrosion, scaling and heat transfer are discussed with methods of selecting proper operating conditions. No calcium nor magnesium scale deposits have formed at any point in the system. The results of the corrosion tests, chemical analyses and visual inspection indicate that the plant should have an operating life in excess of thirty years. From December 21, 1965 to December 30, 1966 the plant produced 349 million gallons or 93% of the design capacity on a continuous basis. On a daily basis, the plant actually averaged 110% of design capacity. However, scheduled downtime for maintenance, along with periods when there was no demand for water, reduced the total annual production. From January 1, 1967 to the present, the plant has averaged about 105% of design. (Knapp-USGS)
W71-00896

SCALE CONTROL CUTS DESALTING COSTS...INCREASING PLANT OUTPUT BY 25 PERCENT,
Baldwin-Lima-Hamilton Corp., Wrightsville Beach, N.C. Industrial Equipment Div.
Robert A. Tidball.
Reprint from The American City, January 1967. 3 p, 3 fig, 2 photo.

Descriptors: *Desalination, *Pilot plants, *Sea water, Scaling, Flash distillation, Research and development.
Identifiers: *Scale control, *Thermal efficiency, Wrightsville Beach (NC).

A 25,000 gpd scale control, flash-distillation unit for desalting sea water was developed at Wrightsville Beach, N. C. The plant consists of two fabricated steel shells four feet in diameter and 35 feet long. Each contains two passes of four stages each for a total of 16 stages. With a 3 degree flashing range per stage, the plant can simulate any 16 consecutive stages operating over any 50 deg range between 100 and 400 deg F. The heat balance and operating flow of the pilot plant is illustrated. Results indicate that scale-free operation can be expected at 250 deg F in a recycle system with double strength sea water, and at 282 deg F with single strength sea water. In a once-through system, scale is not encountered below 300 deg F. (Woodard-USGS)

THEORETICAL ESTIMATES VERSUS FOREST WATER YIELD,
West Virginia Univ., Morgantown. Div. of Forestry.
R. Lee.
Water Resources Research, Vol 6, No 5, p 1327-1334, October 1970. 8 p, 3 tab, 27 ref.

Descriptors: *Rainfall-runoff relationships, *Water balance, *Water yield, *Mathematical models, Data collections, Streamflow, Percolation, Forests, Forest management, Safe yield, Surface drainage, Watershed management, Vegetation effects.
Identifiers: Forest hydrology.

Theoretical and empirical models used to estimate the long-term water balance of small catchments are inadequate as a check on the observed water balance. Under rigorous research conditions, the observational data are accurate to about 13-30% of yield, while the models are accurate only to about 10-60% of yield. Analysis of watershed data shows that the uncertainty in any comparison of theoretical and observed values usually is much greater than the difference between the values compared. In general, such comparisons are not helpful either in confirming or challenging the accuracy of water balance measurements, or in assessing the water-tightness of catchment areas. (Knapp-USGS)

RAINFALL ENHANCEMENT BY DYNAMIC CLOUD MODIFICATION,
Environmental Science Services Admin., Miami Univ., Coral Gables, Fla.; and Atlantic Oceanographic and Meteorological Lab.
William L. Woodley.
Science, Vol 170, No 3954, p 127-132, October 9, 1970. 6 p, 4 fig, 2 tab, 25 ref.

Descriptors: *Cloud seeding, *Artificial precipitation, *Silver iodide, Cloud physics, Weather modification, Florida, Convection, Environmental effects, Nucleation, Atmospheric physics.
Identifiers: *Dynamic cloud modification, Rainfall enhancment.

The relevance and reliability of seeding technology for practical uses are discussed and the results of a new experimental approach are given, in which massive silver iodide seeding caused rainfall increases from single clouds over southern Florida. In the Florida experiments, 19 clouds were used, 14 for seeding and 5 for control. Twenty 50-gram silver iodide pyrotechnics were dropped from aircraft into each cloud--10 on each of two mutually perpendicular passes near cloud top. The seeded clouds grew an average of 3,500 m more than the controls. Precipitation varied widely from cloud to cloud and from day to day, but seeded clouds rained twice as much as the unseeded clouds. Radar was the main tool for precipitation evaluation. In seeding for precipitation increases there are two approaches, static and dynamic, each involving different techniques and amounts of seeding material. Results depend on the initial conditions of the cloud-environment system. (Lang-USGS)

PRELIMINARY EVALUATION OF AVAILABILITY OF POTABLE WATER ON ELLIOTT KEY, DADE COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla.
H. Klein.
Geological Survey Open-file Report 70010, 1970. 15 p, 1 fig, 2 tab, 4 ref.

Descriptors: *Water resources development, Water supply, *Fresh water, *Water resources, *Water management (Applied), *Florida, National parks, Rainfall, Groundwater, Shallow wells, Aquifers, Geology, Limestones, Salinity, Water storage, Water quality, Chlorides, Water analysis, Desalination.
Identifiers: Cisterns, Catchments.

The National Park Service is arranging for the purchase of Elliott Key and adjacent smaller keys in the upper Florida Keys, southeast of Miami, for the proposed Biscayne National Monument. Reviewed possibilities of potable water supplies that will be required in Elliott Key include shallow wells and water storage facilities during the rainy season; roof runoff into cisterns; paved catchments; blending water from different sources; and desalination of brackish water from the Floridan aquifer. Probably the most practical method is desalination. This is based on information on an artesian well drilled to 1,330 feet at the Pennekamp State Park in middle Key Largo and the reasonable cost of desalination by reverse osmosis. (Woodard-USGS)

ANNUAL REPORT OF PHREATOPHYTE ACTIVITIES - 1968,
Bureau of Reclamation, Denver, Colo. Office of Chief Engineer.
Philip M. Turner.

Bureau of Reclamation Report REC-OCE-70-27, July 1970. 21 p, 9 tab, 54 ref.

Descriptors: *Phreatophytes, Water resources, *Weed control, Ecology, *Water conservation, Evaporation, *Evapotranspiration, Vegetation, Water measurement, Forestry, Semiarid land, Lysimeters, *Herbicides, Prototype tests, Bibliographies, Consumptive use, Transpiration, Surfactants, Evaluation, *Tamarisk.

Bureau of Reclamation activities on phreatophyte research and control are described. Regional research contracts have been negotiated with universities in Arizona and Nevada. At Denver, Colo, saltcedar plants are greenhouse- and nursery-cultured and used as test specimens for foliar-applied herbicides. Herbicides are evaluated on saltcedar in plots along the Arkansas River near North Avondale, Colo. Helicopter herbicide spraying was performed on 920 acres (372 ha) of saltcedar at Rye Patch Reservoir by the Bureau and the Pershing County Water Conservation District. 14,000 acres (5,667 ha) of phreatophytes have been removed from the Colorado Indian Reservation near Parker, Ariz., since 1965. Phreatophytes have been controlled by tree crusher, root plow, cutter dozer, and spraying on 38,600 acres (15,645 ha) along the Pecos River in New Mexico.

SYNTHETIC HYDROPHOBIC SOILS FOR HARVESTING PRECIPITATION,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
Dwayne H. Fink, and Lloyd E. Myers.
In: Symposium on Water-Repellent Soils, Proceedings, University of California, Riverside, May 6-10, 1968, Pub March 1969, p 221-240. 7 fig, 2 tab, 8 ref.

Descriptors: *Soil sealants, *Arid lands, *Precipitation (Atmospheric), *Runoff, *Water harvesting, Water conservation, Reservoirs, Soil physical properties, Soil texture, Porosity, Capillary action, Soil investigations, Soil structure, Soil water movement, Particle size, Soil surfaces, Repellents.
Identifiers: *Water-repellent soils, *Hydrophobic compounds, *Catchments, *Breakthrough pressure, Waterdrop contact angle, Effective soil pore radius, Silicones.

In areas of chronic water deficit improved runoff catchments coated with hydrophobic soils may be extremely useful. Of the many chemicals capable of creating water repellency in soils, sodium methylsilanolate (R-20) is the most promising and experiments were therefore undertaken to gauge its effectiveness. Soil breakthrough pressure (h) is directly proportional to the water drop contact angle and inversely proportional to the effective pore radius of the soil. Methods are described for measuring breakthrough pressure, contact angle, effective pore radius, soil particle size and soil surface areas in R-20 treated soils. Results showed that h increased directly with organic coverage and that sandy soils may be more effectively treated than finer textured soils because of their smaller surface area. All soils tested obtained an optimal monolayer coverage of 0.00003 grams R-20 per square meter of soil. At and beyond monolayer coverage the contact angle was relatively constant and about 150 degrees. Evaluation criteria and substances inducing soil repellency are discussed. (Casey-Arizona)

3C. Use of Water of Impaired Quality

SALINE GROUNDWATER RESOURCES OF THE CONTERMINOUS UNITED STATES,
Geological Survey, Menlo Park, Calif.
J. H. Feth.
Water Resources Research, Vol 6, No 5, p 1454-1457, October 1970. 4 p, 4 ref.

Descriptors: *Saline water, *Water resources development, *Reviews, Surveys, Saline water systems, Desalination, Desalination processes, Economics, Water costs, Groundwater basins, Surface waters, Groundwater, Hydrogeology.
Identifiers: Saline water resources.

Saline water is arbitrarily defined as water containing more than 1000 milligrams per liter of dissolved solids. Saline groundwater is known to underlie about two-thirds of the 48 states. Locally, aquifers yield saline groundwater in profuse quantities, some of which is used by industry, particularly for cooling. Generally, however, saline water has been considered a nuisance. In this report it is dealt with as a resource, especially for the future. Forty chemical types of mineralized groundwater were recognized, but sodium chloride dominates the occurrences and is almost the only type found where concentrations exceed about 20,000 mg/liter. The occurrence and hydrologic properties of saline water aquifers deserve much more study than they have had. (Knapp-USGS)
W71-00574

EFFECT OF VARIOUS SALINITY REGIMES ON GROWTH, LEAF EXPANSION AND TRANSPIRATION RATE OF BEAN PLANTS,
National and Univ. Inst. of Agriculture, Rehovoth (Israel). Volcano Institute of Agricultural Research; and Hebrew Univ. of Jerusalem (Israel).
A. Meiri, and Alexandra Poljakoff-Mayber.
Grant No. A10-SWC-7; FS-Is-179 from the U. S. Department of Agriculture. Soil Science, Vol 109, No 1, p 26-34, January 1970. 5 fig, 5 tab, 20 ref.

Descriptors: *Beans, *Salinity, *Plant growth, *Transpiration, *Leaves, Saline soils, Saline water, Salts, Salt tolerance, Semiarid lands, Sodium chloride, Irrigation water, Irrigation effects, Growth rates, Soil-water-plant relationships, Moisture content, Greenhouses.
Identifiers: *Leaf water content, *Irrigated agriculture, *Seedlings.

Bean seedlings in a greenhouse were subjected to various fluctuating salinity regimes in order to simulate field conditions occurring in areas with saline soils or saline water. Plant growth was retarded in all cases and transpiration was reduced by, and in proportion to, salinity. Leaf water content appeared to exert a strong influence on growth and transpiration. Growth retardation was found to be dependent on salinization rate, ultimate salinity level, and duration of seedling exposure to saline conditions. When plants were transferred from a saline to a non-saline medium, they demonstrated a transient burst of growth and an increase in transpiration rate. The seedlings, however, never reached the growth and transpiration levels of non-salinized control plants. The data indicate that under normal field conditions fluctuating salinity regimes will affect plant growth and transpiration less severely than, but similarly to, the constant salinity levels used in most experiments. A MASTER WATER PLAN FOR UNION COUNTY, NEW JERSEY.
Union County Planning Board, N.J.

Available from NTIS as PB-192 856, $3.00 in paper copy, $0.95 in microfiche. April 1970, various pagings.
Identifiers: *Management planning, New Jersey, *New Jersey, *Water supplies, Analysis, Sources, Distribution, Statistical data, Feasibility studies, *Union County (New Jersey), Area planning and development, Water consumption.

The report presents A Master Water Plan for Union County, New Jersey. It includes the analysis of existing sources of supply and distribution system, as presented in the First Stage Report entitled 'Report Upon Water Supplies and Water Facilities in Union County' which has previously been submitted and approved. In this report, the adequacy of existing facilities is analyzed by comparing the safe yield of the existing sources of supply to the present and projected future water consumption. The ability of the existing distribution systems to meet the present and future demands has also been investigated. Recommendations for both short-term and long-range improvements are made. (See also W71-00826)

WATER SUPPLIES AND WATER FACILITIES IN UNION COUNTY.
Union County Planning Board, N.J.

Available from NTIS as PB-192 836, $3.00 in paper copy, $0.95 in microfiche. June 30, 1969, 39 p. Supplement, October 14, 1969, p 40-42.
Identifiers: *Management planning, New Jersey, *New Jersey, *Water supplies, Storage, Sources, Pipes, Chemicals, Water pollution, Storage tanks, Costs, Tables, Statistical data, Maps, *Union County (New Jersey), Area planning and development, *Water facilities.

The report is the first stage of a report dealing with utilities of Union County. The report includes: description of present water supply systems serving municipalities in Union County, including sources of supply, distribution systems and storage systems. The report is intended to describe the existing facilities. In addition the report contains basic data with regard to major pipelines, existing treatment facilities, location of storage tanks and other appurtenances which comprise the general inventory of the utilities. The report indicates the capacity and utilization of existing facilities as well as a determination of the existing facilities as well as a determination of the existing facilities capable to serve present requirements. (See also W71-00827)
W71-00826

STORM DRAINAGE FACILITIES, UNION COUNTY, NEW JERSEY.
Union County Planning Board, N.J.

Available from NTIS as PB-192 822, $3.00 in paper copy, $0.95 in microfiche. May 1970, various pagings.
Identifiers: *Management planning, New Jersey, Floods, Drainage, Storms, Structures, Rainfall, Storage, Fluid flow, Rivers, Design, Tides, Pipes, Inland waterways, Roads, Maps, *Union County (New Jersey), Area planning and development, Storm sewers.

The report presents an inventory and analysis of the storm drainage facilities of Union County, New Jersey. Points of analysis were generally selected where streams cross major County thoroughfares. The tributary area to each of these points were determined. Estimates of minimum design flows were prepared. These suggest minimum design flows were then used to determine the adequacy of the existing drainage facility at the point of analysis. The second stage of this report will analyze tidal influence upon storm drainage facilities and present a recommended plan of improvements. (See also W71-00825)

WATER SUPPLY AND SEWAGE DISPOSAL.
Rensselaer County Dept. of Planning and Promotion, Troy, N.Y.

Available from NTIS as PB-192 431, $3.00 in paper copy, $0.95 in microfiche. 1968, 110 p. HUD Project N.Y. P-168.
Identifiers: *Management planning, New York, Water supplies, Statistical analysis, *Sewage, Disposal, Population, Volume, Costs, Analysis, Statistical data, Urban areas, Rural areas, Storms, Drainage, Maps, *Rensselaer County (New York), Area planning and development, *Cost analysis.

These facilities have been separately examined but are included in a single report. The section of water supply consists of a basic inventory of the existing water systems, their capacity, the number of people served, and the per capita consumption. Also presented is a cost analysis for each community serviced. The section on sewers includes an inventory of the existing sewers and storm water facilities and explanations of the districts proposed by the County, one of the towns, and by three of the villages. Appropriate maps and cost estimates for the new districts are also included.

RISING WATER VALUES THAT RESULT FROM INCREASED MOBILITY,
Utah State Univ., Logan. Dept. of Agricultural Economics.
B. Delworth Gardner, and Herbert H. Fullerton.
Available from NTIS as PB-195 311, $3.00 in paper copy, $0.95 in microfiche. Bulletin, 476, October, 1968. 27 p, 6 tab, 3 fig. OWRR Project B-009-UTAH (9).

Descriptors: *Water transfer, Water rights, Utah, *Irrigation, Institutions, *Costs, *Rent, Evaluation.

This bulletin indicates the gains in the value of water that occurred in one irrigation district in Utah when transfers were permitted between irrigation companies after many years of the typical practice of restricting transfers to those within a given company. The exposition presents a description of the institutional setting before and after the transfer impediment was relaxed; a discussion of the development of the rental market; appraisal of the relation between transfer flexibility and economic efficiency; reporting of rental values and an identification of the variables influencing rental values; and presentation of the statistical results.

THE GOLODNAYA STEPPE: A RUSSIAN IRRIGATION VENTURE IN CENTRAL ASIA,
Michigan State Univ., East Lansing. Dept. of Geography.
Ian M. Matley.
Geographical Review, Vol 60, No 3, p 328-346, July 1970. 3 fig, 28 ref.

Descriptors: *Water utilization, *Arid lands, *Irrigation canals, *Cotton, *Economic feasibility, Government finance, Diseconomies of scale, Depreciation, Economic efficiency, Project planning, History, Economic justification, Financial feasibility, Project feasibility, Concrete-lined canals, Irrigation canals, Canal construction, Salinity, Irrigation systems, Feasibility studies, Crop production.
Identifiers: *Soviet Union, *Turkmenian Desert, *Golodnaya Steppe.

The Golodnaya Steppe in Turkestan is an arid, fertile rolling plain of about 700-800 feet elevation bordering a long river, the Syr Darya. In 1870 the Czarist authorities began long range feasibility studies on extensive irrigation projects in the area in order to eliminate national dependence on imported cotton. The construction and improvements of various canal systems over the next 45 years are described. By 1916, 35,000 hectares were under irrigation, but problems of salinity, waterlogging and malaria had developed and the economics of the scheme were in doubt. Although the irrigated land fell into disuse during the revolution, the Soviet government continued the project with an eventual goal of 500,000 hectares. By 1940, 138,000 hectares were under irrigation, of which 63,000 hectares were in cotton with an average yield of 1770 kilograms per hectare. In 1967, 300,000 hectares were irrigated, but the old problems of salinity were worsening and yield per acre had declined considerably. Despite the enormous investment in the project by the Soviets, increases over achievements of the Czarist government were relatively small in comparison to cost and the goal of independent cotton production may be economically unrealistic. (Casey-Arizona)

METHOD FOR DISCHARGE MEASUREMENTS IN IRRIGATION OUTLETS,
Technion - Israel Inst. of Tech., Haifa. Dept. of Civil Engineering.
M. H. Diskin.
Journal of Agricultural Engineering Research, Vol 13, No 4, p 350-357, December 1968.

Descriptors: *Discharge measurements, *Discharge (Water), *Outlets, *Pipe flow, *Irrigation engineering, Flow measurement, Pipes, Flowmeters, Equations, Hydraulics, Irrigation, Irrigation water.
Identifiers: *Critical depth, *Depth of flow, *End depth, *Irrigation outlets.

Discharge from irrigation outlet pipes (horizontal circular channels) was calculated by measuring the depth of flow at a station located 5.2 D from the end of the outlet. In experiments on 6, 8, 10, and 16 in. pipes, discharge was found to be functionally related to depth at the measuring station. The equation expressing this relationship is Q/ (g D super 5) super 1/2 equals 0.884 (h sub s/D) super 2.23, where Q is channel discharge, g is acceleration due to gravity, D is diameter of the circular channel, and h sub s is depth of flow at the measuring station. Small flow disturbances at the end of the outlet do not affect the relationship. This new method of calculating discharge from irrigation outlets appears to overcome some of the difficulties of two presently used methods, since it does not require any attachments to the end of the pipe and the measuring station is located upstream of the end section. AMITROLE RESIDUES AND RATE OF DISSIPATION IN IRRIGATION WATER,
Agricultural Research Service, Denver, Colo. Crops Research Div.; and Agricultural Research Service, Prosser, Wash. Crops Research Div.
Robert J. Demint, Peter A. Frank, and Richard D. Comes.
Weed Science, Vol 18, No 4, p 439-442, July 1970. 3 fig, 4 tab, 5 ref.

Descriptors: *Aminotriazole, *Irrigation water, *Irrigation canals, *Laterals, *Aquatic weed control, Herbicides, Weed control, Irrigation, Irrigation ditches, Washington, Colorado, Sampling.
Identifiers: *Herbicide residues, *Rate of dissipation.

A single ditchbank on two different canals were treated with 4.5 and 3.4 kg/ha of amitrole-T (amitrole-ammonium thiocyanate). Subsequent maximum concentrations of amitrole (3-amino-s-triazole) in the flowing water (1.13 and 0.65 cu m/sec) were 31 and 43 ppb, respectively. Both banks of another canal were treated before the turning of 1.42 cu m/sec of water into the canal, resulting in a maximum reading of 98 ppb of amitrole. Two hours after the main body of amitrole-bearing water had past the last sampling station, amitrole levels in each canal were down to 1 ppb or less. For distances up to about 14.5 km, amitrole dissipation in canals was a linear function of the herbicide concentration and the downstream flow. The dissipation rate was slowest when opposite canal banks were treated, medium when single banks were treated, and fastest when the herbicide was added directly to the water. Since amitrole is used to treat the banks of irrigation canals, this information should be useful when irrigation water is applied to crops which are intolerant of high herbicide levels. IRRIGATION STUDIES ON COTTON: II. BOLL WEIGHT AND FIBRE PROPERTIES,
Central Arid Zone Research Inst., Jodhpur (India).
Kumar Vijay, and P. C. Raheja.
Annals of Arid Zone, Vol 8, No 1, p 105-108, 1970. 2 tab, 12 ref.

Descriptors: *Cotton, *Fibers (Plant), *Irrigation effects, *Soil moisture, *Arid lands, Crop production, Irrigation, Furrow irrigation, Sprinkler irrigation, Flood irrigation, Irrigation systems, Soil-water-plant relationships, Moisture availability.
Identifiers: *Irrigated agriculture, *Boll weight, Rajasthan (India).

Three varieties of long staple cotton, 216 F, H sub 14, and Andrews, were studied in western Rajasthan (India) in order to determine the effect of irrigation on boll weight and cotton fiber properties. Three soil moisture levels (0.3 atm, 0.6 atm, and 0.85 atm) and three irrigation methods (flat, furrow, and sprinkler) were tested in all possible combinations with the cotton varieties. The various boll and fiber characteristics of 216F and H sub 14 were quite similar. Both of the varieties yielded significantly higher boll numbers, dry weight of bolls per plant, ginning out turn, and strength of fiber than Andrews. However, Andrews showed higher 500-seed weight and mean fiber length than the other two varieties. Most fiber properties were not affected by the various irrigation methods, but fiber strength was significantly increased by flat irrigation over furrow irrigation in the first year. Soil moisture levels at 0.3 atm were superior to 0.85 atm for mean fiber length, but in 1963 the reverse was true for fiber strength. (Carr-Arizona)
W71-00703

IRRIGATION STUDIES ON COTTON IN ARID ZONE: I. EFFECT OF VARIOUS METHODS OF IRRIGATION AND LEVELS OF SOIL MOISTURE ON GROWTH AND YIELD OF THREE VARIETIES OF COTTON,
Central Arid Zone Research Inst., Jodhpur (India).
Kumar Vijay, and P. C. Raheja.
Annals of Arid Zone, Vol 8, No 1, p 98-104, 1970. 5 tab, 23 ref.

Descriptors: *Cotton, *Irrigation effects, *Soil moisture, *Plant growth, *Arid lands, Crop production, Irrigation, Furrow irrigation, Sprinkler irrigation, Flood irrigation, Irrigation systems, Moisture availability, Soil-water-plant relationships, Seeds.
Identifiers: *Irrigated agriculture, *Rajasthan (India).

Three varieties of long staple cotton, 216F, H sub 14, and Andrews, were studied in western Rajasthan (India) in order to determine the effect of irrigation on growth, yield, and quality of cotton. Three soil moisture levels (0.3 atm, 0.6 atm, and 0.85 atm) and three irrigation methods (flat, furrow, and sprinkler) were tested. Cotton variety Andrews appeared totally unsuited to arid climates. Varieties 216F and H sub 14 grew well and showed little difference in growth and yield characteristics. There was no marked difference in results between furrow and sprinkler irrigation. Both systems were consistantly superior to the flat method. Water availability to plants decreased progressively from 0.3 to 0.85 atm tension, significantly reducing plant growth and seed yield. It appears that irrigation between 0.3 and 0.6 atm is best. (Carr-Arizona)

ENGINEERING COST ANALYSIS FOR BEAVER IRRIGATION PROJECT.
Ozarks Regional Commission.

Available from NTIS as PB-191 695, $3.00 in paper copy, $0.95 in microfiche. 1970. 10 p, maps.
Identifiers: *Agriculture, *Aarkansas, *Irrigation systems, Costs, Water supplies, Natural resources, Dams, Feasibility studies, Statistical data, Systems engineering. Benton County (Arkansas), Washington County (Arkansas), Agricultural engineering.

The document contains an engineering analysis and report on development of a proposed water distribution system for irrigation in parts of Benton and Washington Counties, Arkansas. The report involves application of engineering techniques to investigate the cost to supply irrigation water to the project area with subsequent costs to distribute this water on-farm.
W71-00812

CONSUMPTIVE USE OF IRRIGATION WATER IN WYOMING,
Wyoming Univ., Laramie. Water Resources Research Inst.
Frank J. Trelease, Paul A. Rechard, Theodore J. Swartz, and Robert D. Burman.
Available from NTIS as PB-195 624, $3.00 in paper copy, $0.95 in microfiche. Wyoming Water Resources Research Institute, Water Resources Series No 19/Wyoming Water Planning Report No 5. July, 1970. 103 p, 4 tab, 7 fig, 2 maps, 10 ref, append. OWRR Project B-003-WYO (1).

Descriptors: *Consumptive use, *Irrigation practices, *Water use, *Planning, Effective precipitation, Climatic data, Evapotranspiration, Computer programs, Wyoming, Water resources development.

It is essential that irrigation water requirements and consumptive uses of water be known, when planning for water resource development at any level of government. The Blaney-Criddle Method of estimating consumptive use was chosen to provide guidelines of water use throughout Wyoming because it is widely accepted, is easy to use, and utilizes readily available climatic data. A digital computer program for solution of the method was prepared and data for fifty-six climatological stations in Wyoming are presented. (Rechard-Wyoming)

A RATIONAL APPROACH TO THE DESIGN OF CHECK SYSTEMS OF IRRIGATION,
Punjab Agricultural Univ., Hissar (India). Dept. of Agricultural Engineering.
V. V. N. Murty, and M. C. Agarwal.
Journal of Agricultural Engineering Research, Vol 15, No 2, p 163-170, June 1970. 3 fig, 2 tab, 4 ref.

Descriptors: *Irrigation design, *Percolation, *Soil moisture, *Soil physical properties, *Streamflow, Irrigation, Irrigation water, Surface irrigation, Hydraulics, Field capacity, Bulk density, Soil density, Infiltration, Wilting point, Equations, Mathematical models.
Identifiers: *Check irrigation, *Percolation losses.

A seven-step method is presented by which the size of check can be determined from known stream size and soil characteristics. The technique is supposed to overcome the inadequacies of the presently used Israelsen formula, especially in the area of percolation losses. Irrigation studies have shown that some percolation loss inevitably results when completely irrigating a plot, but this loss can be reduced by utilizing larger stream size. In this way percolation losses are lowered by reducing the time of initial water spread. A mathematical expression is derived for determining percolation losses under a given set of conditions. The article includes a nomograph for use in such a determination. (Carr-Arizona)

RECLAMATION OF A SALINE-ALKALI SOIL IN THE UPPER INDUS BASIN,
H. S. Zaidi, M. A. Nur-ud-din, K. D. Qayyum, and K. D. Gowans.
Pakistan Journal of Science, Vol 20, No 4, p 171-177, July 1968. 2 fig, 2 tab, 3 ref.

Descriptors: *Reclamation, *Saline soils, *Alkali soils, *Leaching, *Soil amendments, Soil profile, Soil chemical properties, Soil conservation, Gypsum, Rice, Calcium, Carbonates, Sodium, Solubility, Solutes, Organic matter, Ion exchan

Sampling, Salts, Soil analysis, Hydrogen ion conenration, Crop production, Wheat.
Identifiers: *West Pakistan, *Upper Indus Basin.

Soil profile analyses in the Upper Indus Basin of West Pakistan indicate that about 85% of the saltaffected soils are either saline-alkali or alkali. Reclamation by simple leaching is not feasible because of slowly soluble Ca carbonate which replaces exchangeable Na. Therefore, experiments were begun using amendments -- gypsum, S and organic matter-which increase Ca carbonate solubility. Plots on barren, salt-affected land were treated with either 2 or 5 tons gypsum/acre, 20 tons of barnyard manure/acre or 5 tons gypsum and 20 tons barnyard manure/acre. Some were left untreated. Subsequently, the plots were leached and planted to rice crops. Yields in terms of gross income minus amendments, were compared. They were significantly higher than those of untreated plots and the results indicated best success with the combination of 2 tons gypsum and 20 tons barnyard manure/acre. (Casey-Arizona)

METHOD FOR DETERMINATION OF SAFE YIELD AND COMPENSATION WATER FROM STORAGE RESERVOIRS,
Corps of Engineers, Sacramento, Calif. Hydrologic Engineering Center.
Leo R. Bearch.
Tech Paper No 3, The Hydrologic Engineering Center, Corps of Engineers, US Army, Aug 1965. 15 p, 17 ref.

Descriptors: *Simulation analysis, *Reservoirs, *Reservoir operation, Optimization, Streamflow.

The trend toward multiple use of reservoir space and the consideration of prior rights and legal restrictions dictate that a detailed sequential analysis of inflows, outflows and operation factors be made. These principles are used in the determination of reservoir yield, regardless of the nature or type of water supply reservoir. Three types of reservoirs considered were designed for this report: (a) impounding reservoirs from which water supply is piped direct to destination, (b) regulating reservoirs from which water is released to the river for downstream use, and (c) pump storage reservoirs into which water is diverted or pumped from the river for future use. The basic procedure used throughout the United States consists of performing a reservoir routing or reservoir simulation study which require considerable time and effort. The general procedure for performance of a detailed project routing study was described. The steps included: (a) determination of non-project streamflow at each reservoir site and at downstream points of diversion, (b) determination of monthly firm supply, (c) determination of monthly reservoir stage limitations, (d) determination of expected average monthly evaporation and seepage loss, (e) development of the relation of river percolation losses to rate of flow, (f) development of the multireservoir operation criteria, (g) establishment of criteria for allowable shortages, (h) establishment of initial reservoir stage, and (i) performance of routing operation. Mentioned was the fact that considerable effort is being currently devoted to obtaining more dependable measures of potential streamflow by use of streamflow simulation procedures. Has 17 references. A HYDROLOGIC WATER RESOURCE SYSTEM MODELING TECHNIQUE,
Corps of Engineers, Sacramento, Calif. Hydrologic Engineering Center.
L. G. Hulman, and D. K. Erickson.
Tech Paper No 16, The Hydrologic Engineering Center, Corps of Engineers, US Army. 31 p, 6 fig, 6 tab.

Descriptors: *Mathematical models, *Simulation analysis, *Hydrologic properties, *Delaware River, *Streamflow, *Reservoirs, Droughts, Computer programs, Gaging stations, Design.

The record Northeastern United States drought of the 1960's necessitated a detailed reappraisal of water resource systems previously proposed in the affected areas. To facilitate analysis of the effects of the drought, a mathematical modeling technique was developed to allow simulation of the hydrologic properties of the lower Delaware River basin and included eight water resources projects. Modeling requirements considered were: flow records, flow requirements, reservoir operation, and routing requirements. The reservoir system, the general method of analysis and its internal and external constraints were discussed. The final requirements for the model were the determination of the locations of streamflow simulation in the model the 'design' features to be studied, and the statement of the logical methodology required for conversion to instructions necessary for computer processing. Fifteen gaging stations were used as key flow points in the model. Inflows into the reservoirs were computed either by simple drainage area ratios when records were available or by correlation relationships with streamflow data elsewhere in the area where records were not available. (Kriss-Cornell)

WORTH OF STREAMFLOW DATA FOR PROJECT DESIGN - A PILOT STUDY,
Geological Survey, Sacramento, Calif. Hydrologic Systems Lab.; and Corps of Engineers, Sacramento, Calif. Hydrologic Engineering Center.
D. R. Dawdy, H. E. Kubick, L. H. Beard, and E. R. Close.
Tech Paper No 8, The Hydrologic Engineering Center, US Army Corps of Engineers, April, 1968. 9 p, 2 fig, 2 tab, 1 append, 5 ref.

Descriptors: Optimization, *Simulation analysis, *Optimum development plans, *Streamflow, *Design data, *Reservoir design, Multiple-purpose reservoirs, Statistical methods, California.
Identifiers: Historical record.

A procedure for evaluating the worth of streamflow data for project design was described and a simplified example was shown. The present study assessed the effect of sampling error on the worth of data used for ultimate reservoir design. The contemplated methodology as applied in a limited manner to one location for design of a multipurpose reservoir for water supply and low flow regulations, with flood control and minimum pool fixed, was examined. In order to assess the effect of sampling errors in streamflow data on reservoir design, several factors were considered. First, a 'true'optimum design must be known, so that departures from the true design could be measured. Second, the variability of the departures from the true design should depend upon the length of record used for design purposes and statistical properties of the streamflow for the basin to which the design is applied. The Streamflow record for Arroyo Seco near Soledad, California was used. The measured record of flow was used to establish statistics describing the historical record. A 500-year base 'record' was simulated with statistical properties similar to the measured record and was used to determine an optimum design for a simplified multipurpose reservoir for both a 'high' and a 'low' yield at the site. NAPORRA V WECKWERTH (ACQUSITION OF PRESCRIPTIVE RIGHT TO DRAIN SURFACE WATER).

226 NW 569-572 (Minn 1929).

Descriptors: *Minnesota, *Prescriptive rights, *Easements, *Surface drainage, Surface runoff, Drainage, Drainage water, Surface waters, Watercourses (Legal), Natural flow, Land tenure, Ditches, Tile drains, Judicial decisions, Legal aspects, Damages.

Plaintiff sought damages for and relief from defendant's obstruction of the flow of surface water from plaintiff's land through a ditch located on defendant's land. The evidence showed that plaintiff's grantor had constructed the ditch on defendant's

grant's land, that plaintiff had on occasion cleaned such ditch, that defendant had seven years earlier put tile in the ditch and that defendant had filled in a hole on his land so that the ditch could not function. The jury found plaintiff had not been damaged, but that he had acquired a prescriptive right to drain water from his land through the ditch. The Supreme Court of Minnesota affirmed. The court stated that the character of the usage of an easement which will ripen into a legal right by prescription is the same as is required to gain title to land by adverse possession. Defendant had contended that his grantor had only given permission to use the ditch for drainage. However, the court held that the evidence was such as to warrant an inference that plaintiff's grantor had entered adversely to defendant's grantor and that defendant's grantor had merely acquiesced in the construction of a drainage ditch through his land. The Utah Department of Natural Resources, Division of Water Resources (formerly the Utah Water and Power Board) has been charged by the State Legislature with the responsibility of developing a state water plan which would coordinate and give direction to the activities of all state and federal agencies concerned with Utah's water resources. One of the first steps to accomplish this purpose was to divide the state into 10 natural drainage basins and then proceed to inventory and analyze the water resources within each basin. One of the major items to consider in such a study is the amount of water depleted from the basin through the processes of evaporation and transpiration.

Identifiers: *Susquehanna River basin (NY, Penn, and Md), Streambank stabilization.

This brochure is a brief summary of the Susquehanna River Basin Study made by various Federal and State agencies under the broad guidance of the Study's Coordinating Committee. In response to requests from basin residents, the United States Senate, by a resolution of its Committee on Public Works in 1961, requested that a comprehensive plan be prepared 'for the development of the water and related land resources of the Susquehanna River basin in the States of New York, Pennsylvania, and Maryland.' The study was to be carried out 'in the combined interest of flood control, navigation, water supply, recreation, pollution abatement, and other beneficial water uses.' The House of Representatives, by a similar resolution of its Committee on Public Works, joined with the Senate in its request. The main report will be presented by the Coordinating Committee to the Water Resources Council which will vorward it to the President and the Congress. (Woodard-USGS)

TRANSIENT FLOW BETWEEN PARALLEL DRAINS,
California Univ., Los Angeles; and San Jose State Coll., Calif.
William Wen-Gong Yeh, and Rameshwar Singh.
Journal of Hydrology, Vol 11, No 3, p 301-312, September 1970. 12 p, 12 fig, 1 tab, 7 ref.

Descriptors: *Subsurface drainage, *Unsteady flow, *Groundwater movement, *Mathematical studies, *Computer programs, Linear programming, Soil water movement, Drainage systems, Hydraulic conductivity, Specific yield, Dupuit-Forchheimer theory, Permeability, Drawdown.
Identifiers: Transient groundwater flow.

The problem of transient-flow subsurface drainage between parallel drains has been solved by the method of weighted-residuals. The assumption of an initial profile is removed in this method. The governing nonlinear partial differential equation is reduced to ordinary differential equations which are easily solvable on the computer. The solution is presented in two nondimensional graphical forms for easy field application. (Knapp-USGS)

Annals of Arid Zone, Vol 8, No 2, p 267-274, Se tember 1969. 1 fig, 8 ref. OSW Contract 14-0 0001-630.

Descriptors: *Artificial recharge, *Recharge well *Groundwater recharge, *Water conservatio *Hydrogeology, Sedimentary basins (Geologica Alluvium, Ephemeral streams, Effluents, On-si tests, Arid lands, Arizona, Wells, Pumpin Withdrawal, Design, Injection wells, Equipme Subsurface flow.
Identifiers: Tucson (Arizona).

Tucson, Arizona, obtains its entire water supply pumping groundwater. Recharge occurs during fluent seepage in ephemeral rivers, but it is laggi behind withdrawal and water levels are dropping a rate of about 1 meter per year. Artificial w recharge appears to be the best regional water co servation mechanism. In designing an artific recharge well, it is important to investigate subs face materials at the proposed site. Driller's lo were examined, a water supply well and 3 obser tion wells were drilled, geophysical explorati techniques were utilized and subsurface fl characteristics determined. Since the materials the vadose zone were found to be highly perm ble, a dual recharge well was constructed recharge of the unsaturated region as well as phreatic zone. The design and operation of the w are described in detail. Injected water was indus al effluent from a nearby power plant. Recha tests showed injection rates ranging over 23- cubic meters per hour. Such wells may be effect tools for water conservation in the Tucson Ba (Casey-Arizona)

Progress of Hydrology, Vol I, pp 265-289, 1969. 25 p, 8 fig, 11 ref.

Descriptors: *Analog Computers, *Aqui Hydrology, Groundwater, Analytical techniq Missouri River.

A complete description of the Analog comp generally consisting of an analog made and ex tion-response apparatus, i.e., a waveform ge tor, pulse generator, and oscilloscope, presented. The analog model described was a r lar array of resistors and capacitors, and w caled down version of the aquifer. An analogy drawn between electrical systems and aq systems. The excitation-response apparatus w lustrated. An investigation made by Saskatchewan Research Council from 196 1966 to determine the nature and extent of and gravel aquifers in the buried Missouri Valley system in the vicinity of Est

skatchewan, Canada and to estimate the potential yield of the aquifers with selected schemes of velopment was given as a case history of the use an analog computer. The investigation included llection and analysis of water-level data to define e piezometric surfaces of the aquifers and asciated deposits and the data on the chemical aracter of the groundwaters, an extensive textle drilling program, controlled aquifer and well oduction tests, and an analog computer study. e reach of the buried Missouri River Valley tem west, east and north of Estevan was conered. ROUNDWATER UTILIZATION: STUDY OF ETHODS, WITH ENGINEERING ANALYSIS,
dro Research Science, Sunnyvale, Calif.
exander B. Rudavsky.
ailable from the NTIS as AD-858 430, $3.00 in per copy, $0.95 in microfiche. September 13, 59. 42 p.
ntifiers: *Water, Underground, *Water supes, *Drilling, *Water wells, *Bibliographies, rilling machines, Reviews, Test methods, Indusl production, Army operations, Military eneering, Catalogs, Groundwater, Potable water.

e objective of the report is to summarize known ll-construction techniques for obtaining groundter during military field operations. A considera number of references on drilling methods and ipment exist in multi-language literature. The rature study shows considerable completed earch for developing bottom hole drilling thods. There has been much study on the contional application of turbodrills in Russia. Conerable efforts have also been spent to improve sent drilling tools and systems in order to reduce lling costs. The review of manufacturer's alogs, leaflets, descriptive literature, and other nted matter on off-shelf items for the well lling industry indicates very few radical changes drilling concepts but a trend of the industry to prove the drilling techniques and well construcn.

DROLOGY OF PROJECT GASBUGGY SITE, O ARRIBA COUNTY, NEW MEXICO,
ological Survey, Denver, Colo.
ry W. Mercer.
ailable from NTIS as PNE-1013, $3.00 in paper py, $0.95 in microfiche. Atomic Energy Comsion Project Gasbuggy Peaceful Nuclear Explons Report PNE-1013 (TID-4500), March 6, 70. 45 p, 12 fig, 4 tab, 4 ref.

scriptors: Hydrology, *Nuclear explosions, *Unground, *New Mexico, Groundwater, Aquifers, nsmissivity, Aquifer characteristics, Water ls, Discharge measurement, Water quality, drologic data, Geology, Sandstones, Draindown, uations, Chemical analysis, Pollutants.
ntifiers: *Ojo Alamo Sandstone, Exploratory es.

e Project Gasbuggy nuclear experiment of 26 otons design yield was detonated at 4,240 feet ow ground surface at the Gasbuggy site in Rio riba County, New Mexico on December 10, 57. The experiment was designed to increase the meability of a low-yield natural gas formation. e Ojo Alamo Sandstone reportedly was the only uifer within probable range of fracturing at the . Thus, hydrologic testing in the exploratory es was in that sandstone between approximate oths of 3,475 and 3,650 feet. Data indicated that he nuclear detonation fractured the Ojo Alamo dstone, water from this sandstone would fill the mney or detonation chamber at an estimated e of less than half a foot per day. The low transsivity of the sandstone aquifer would hinder the nsport of radioactive contaminants in water in aquifer, even if momentary overpressure in the losion cavity caused contaminants to reach the o Alamo Sandstone. Observation of water levels in wells and measurements of yields of springs prehot, at shot time, and postshot indicate that the detonation did not significantly or permanently disturb nearly water wells or springs. (Woodard-USGS)

OPTIMIZING CONJUNCTIVE USE OF GROUNDWATER AND SURFACE WATER,
Utah Water Research Lab., Logan.
James H. Milligan.
Available from NTIS as PB-192 712, $3.00 in paper copy, $0.95 in microfiche. June 1970. 160 p. PRWG 42-4T.
Identifiers: *Management planning, Hydrology, *Water supplies, *Utah, Mathematical models, Programming (Computers), Stochastic processes, Linear programming, Rivers, Design, Probability, Optimization, Storage, Costs, Theses, *Groundwater, *Water management, Computerized simulation, Surface water runoff.

The determination of optimal allocations of surface water and groundwater resources that will accomplish the objective of economic efficiency as measured by maximizing net benefits is the basic objective of the several models developed and described in this report. The mathematical procedure used for optimizing the water resource allocations in this fashion makes use of several algorithms of linear programming as available on a Univac 1108 digital computer. Each of the solutions derived from the models presented is analyzed in order to evaluate the optimization procedure. Models are formulated for one hypothetical hydrologic unit or basin and for two real river basins. The real river basins were used to test the viability of the modeling procedure and to evolve a practical methodology.
W71-00816

FRESHWATER BUBBLES: A POSSIBILITY FOR USING SALINE AQUIFERS TO STORE WATER,
Geological Survey, Denver, Colo.
E. A. Moulder.
Water Resources Research, Vol 6, No 5, p 1528-1531, October 1970. 4 p, 3 fig, 1 tab, 8 ref.

Descriptors: *Water storage, *Reviews, *Underground storage, *Saline water systems, *Water resources development, Aquifers, Saline water, Groundwater movement, Mixing, Dispersion, Diffusion, Flow, Water management (Applied), Conjunctive use.
Identifiers: Saline water resources, Saline aquifers.

Saline aquifers appear to have promising storage capabilities for freshwater supplies. Such aquifers would be a practical alternative to surface water reservoirs in areas where natural reservoir sites are scarce or where evaporation might consume a substantial part of the water stored. A single experiment in Virginia more than 20 years ago shows that a substantial amount of freshwater injected into the saline aquifer can be recovered. Environmental factors that affect water recovery are dispersion and mixing at the fresh-saline water interface, reshaping of the interface because of density differences of the fluids, and groundwater movement in the saline aquifer system. Mathematical approaches to estimating these factors are reviewed. Feasibility studies of storage facilities should include evaluation of at least these three factors. (Knapp-USGS)

FLUID MODEL STUDIES OF THE STORAGE OF FRESHWATER IN SALINE AQUIFERS,
Louisiana State Univ., Baton Rouge.
Oscar R. Kimbler.
Water Resources Research, Vol 6, No 5, p 1522-1527, October 1970. 6 p, 4 fig, 4 ref.

Descriptors: *Hydraulic models, *Underground storage, *Artificial recharge, *Saline water systems, Injection wells, Model studies, Mixing, Withdrawal, Dispersion, Diffusion, Conjunctive use, Water resources development, Aquifers.
Identifiers: Saline aquifers, Saline water resources.

Flow studies in artificial sandstone models were used to test and validate a computational technique for predicting the recovery of freshwater stored in saline aquifers. These studies indicate the physical and operational conditions under which such storage should be technically feasible, and show that gravitational effects are usually a much more important cause of poor freshwater recovery than is dispersion. (Knapp-USGS)
W71-00838

STORAGE OF NATURAL GAS IN SALINE AQUIFERS,
Michigan Univ., Ann Arbor.
Donald L. Katz, and M. Rasin Tek.
Water Resources Research, Vol 6, No 5, p 1515-1521, October 1970. 7 p, 9 fig, 2 tab, 8 ref.

Descriptors: *Underground storage, *Aquifers, *Reviews, *Saline water systems, *Natural gas, Water resources development, Injection wells, Oil fields, Oil reservoirs, Injection.
Identifiers: Saline aquifers.

Value, extent, and engineering description of underground storage of natural gas in saline aquifers are reviewed. Problems associated with evaluation of aquifer storage prospects, geologic and geochemical requirements have been discussed along with topics related to operating pressures, gas retention, and pump tests. (Knapp-USGS)
W71-00839

REDUCING LAND SUBSIDENCE IN THE WILMINGTON OIL FIELD BY USE OF SALINE WATERS,
Long Beach Dept. of Oil Properties, Calif.
Robert L. Pierce.
Water Resources Research, Vol 6, No 5, p 1505-1514, October 1970. 10 p, 9 fig.

Descriptors: *Injection wells, *Oil fields, *Land subsidence, *California, *Withdrawal, Secondary recovery (Oil), Flooding, Oil wastes, Water treatment, Brine disposal.
Identifiers: Subsidence control, Long Beach (Cal).

The subsidence at Long Beach encompassed an area of 22 square miles; sinkage ranges from 2 feet to 30 feet. The subsidence is attributed to pressure reduction due to oil production from the Wilmington oil field. Injection of saline water stopped the Long Beach harbor area subsidence and has developed a technology for an economic waterflood project. Through December 1968, 2.1 billion barrels of saline water have been injected into the Wilmington oil field. The current injection rate of the field is 1.1 million barrels per day. The methods being used to clean the oil field's produced brine include: (1) filtration, (2) re-cycling through the shallow source water beds, and (3) blending with fresh or other saline waters. (Knapp-USGS)

MINING WATER IN IRAN,
Utah State Univ., Logan. Dept. of Agricultural Economics.
Allen LeBaron, and Malek Mohtadi.
Utah Science, Utah Agricultural Experiment Station, Utah State University, September 1968, Vol 29, No 3, p 88-89, 92, 2 fig.

Descriptors: *Groundwater supply, *Irrigation wells, *Arid lands, *Groundwater mining, *Water harvesting, Social aspects, Shafts (Excavations), Tunnel construction, Cost comparisons, Irrigation systems, Water reuse, Canals, Wells, Runoff.
Identifiers: *Ghanats, *Moghanis, *Horizontal wells, *Underground infiltration tunnels, Well development, Iran.

Ghanats (underground infiltration tunnels or horizontal wells) are an important water source in Southwest Asia and North Africa. From 1/3 to 3/4 of all irrigation in Iran is supplied by ghanats. They capture rainwater which runs quickly off mountains and seeps into alluvial fans. A mother well is evcavated and the water flows to the surface by a gently sloping tunnel, then travels by open canal. The underground ghanat is marked by shafts used to lift earth during construction and to facilitate maintenance. The average ghanat is 150 feet deep and over 2 miles long. A long ghanat may have several hundred shafts. Seepage from irrigated fields is sometimes recollected and passed on to another ghanat. Water ownership is the deciding factor in land settlement. For aesthetic, mechanical and supply reasons, mills and residences are located near ghanats. Costs of ghanats may be favorable compared to drilled wells utilizing petroleum. Workers called 'Moghanis' specialize in ghanat excavation and maintenance--a family occupation passed through generations. Although there are hazards of falling stones, collapsing roofs, asphyxiation and drowning, there are from 20,000 to 40,000 Moghanis. A typical cross-section and areal route of an Iranian ghanat are shown in the article. (Popkin-Arizona)
W71-00958

RECHARGING THE OGALLALA FORMATION USING SHALLOW HOLES,
Texas Tech Univ., Lubbock. Dept. of Agricultural Engineering.
Marvin Dvoracek, and Sam H. Peterson.
Texas Tech Univ Contribution No 78, Paper Presented at Ogallala Aquifer Symposium, Texas Tech Univ, Lubbock, April 30-May 1, 1970. 18 p, 7 fig, 1 tab, 15 ref. OWRR Project B-041-Tex.

Descriptors: *Artificial recharge, *Injection wells, *Unsaturated flow, Water levels, Infiltration, Water table, Water level fluctuations, Percolation, Permeability, Caliche, Alluvium.
Identifiers: Ogallala aquifer, Shallow recharge wells.

Natural groundwater recharge cannot sustain the Southern High Plains portion of the Ogallala Formation. Nearly all the water used in this region is derived from the Ogallala Formation. The southern part of the Ogallala is hydrologically isolated from all outside areas; natural recharge to this portion of the aquifer originates only form precipitation falling on the aquifer. The region has only limited and erratic rainfall, poorly established drainage, and very few lakes or reservoirs; therefore, it offers little opportunity for natural recharge. The volume of water withdrawn, as shown by the water level decline, is many times greater than the estimated natural recharge of about 1 inch per year. In tests, more than 15 acre-feet of runoff water was recharged in shallow holes completed above the water table. Increases in rate of recharge were observed during the tests. A condition of soil piping is probably responsible for the increasing rates and loss of material from cavities near the recharge wells. (Knapp-USGS)

TAUNTON RIVER BASIN-MASSACHUSETTS BASIC-DATA REPORT NO. 12, GROUNDWATER SERIES,
Geological Survey, Boston, Mass.
John R. Williams, and Richard E. Willey.
US Geological Survey Open-file report, 1970. 102 p, 1 fig, 1 plate, 5 tab, 4 ref.

Descriptors: *Hydrologic data, *Water wells, Massachusetts, *Groundwater, *Water levels, Water quality, Aquifers, Water resources, Water resources development, Water yield, Observation wells, Sampling, Hydrogeology, Data collections.
Identifiers: Taunton basin (Mass).

This report presents in tabular form selected records of wells, test wells, and borings collected during a study of the Taunton basin from 1966 to 1968 in cooperation with the Massachusetts Water Resources Commission, and during earlier studies. The public and local, state, and federal agencies may use this basic groundwater information that may aid in planning water-resources development. Data on 2,059 selected wells, test wells, and borings, including United States Geological Survey auger borings, Massachusetts Department of Public Works bridge and roadway borings, and miscellaneous foundation borings are tabulated. Chemical and partial chemical analyses are given of the water from 137 wells. Water level measurements in 11 observation wells are presented as hydrographs. (Knapp-USGS)

4C. Effects on Water of Man's Non-Water Activities

MODELING THE EFFECT OF LAND USE MODIFICATIONS ON RUNOFF,
Agricultural Research Service, Brookings, S. Dak. and Water Resources Board, Reading (England).
C. A. Onstad, and D. G. Jamieson.
Water Resources Research, Vol 6, No 5, p 1287-1295, October 1970. 9 p, 9 fig, 8 tab, 6 ref.

Descriptors: *Rainfall-runoff relationships, *Mathematical models, *Precipitation excess, *Parametric hydrology, Simulation analysis, Routing, Synthetic hydrology, Runoff forecasting, Land use, Land management, Hydrograph analysis, Optimization, Flood control, Soil conservation.
Identifiers: *Runoff management.

The natural apportionment of rainfall excess to surface and subsurface flow can mean the difference between large flow rates for a short time or more manageable flow rates over a longer time. By using available soil storage, peak flood flows can be reduced without necessarily reducing the total volume of runoff. A model was made to simulate this phenomenon. The land phase of the hydrologic system was simulated by a series of interconnected nonlinear reservoirs and the channel phase by a single linear reservoir. By manipulation of parameters which mathematically represent physical measurements, the watershed response to the addition of conservation practices, such as terracing, may be predicted. (Knapp-USGS)

THE MEASUREMENT OF THE EFFECTS OF BUILDING CONSTRUCTION ON DRAINAGE BASIN DYNAMICS,
Exeter Univ. (England).
D. E. Walling, and K. J. Gregory.
Journal of Hydrology, Vol 11, No 2, p 129-144, August 1970. 16 p, 8 fig, 21 ref.

Descriptors: *Construction, *Urbanization, *Sediment yield, *Storm runoff, Rainfall-runoff relationships, Hydrograph analysis, Erosion, Soil erosion, Regression analysis, Peak discharge, Stage-discharge relations.
Identifiers: Urban hydrology.

The magnitude of the impact of building activity upon suspended sediment concentrations may be assessed by comparing samples obtained simultaneously at different points within one catchment or by comparing samples derived from two adjacent small watersheds, one of which serves as a control. In each case the suspended sediment concentrations are between 2 and 10 times, and occasionally up to 100 times, greater than the concentrations obtained from undisturbed conditions. The form of the relationships obtained demonstrates the importance of variable source areas within the catchments. To assess the yields over time, stream flow and sediment records are required. A small catchment has been instrumented for this purpose on the margin of Exeter, Devon, England. The catchment was calibrated for a period of 17 months prior to building activity by deriving multiple regression equations relating peak flow, runoff amount and runoff percentage to precipitation characteristics at different times of the year, evaluating unit hydrographs, by establishing suspended sediment rating curves, and by using adjacent catchments as controls. 4D. Watershed Protection

A GEOMORPHIC APPROACH TO EROSION CONTROL IN SEMIARID REGIONS,
Colorado State Univ., Fort Collins. Dept. of Geology.
S. A. Schumm.
American Society of Agricultural Engineers Transactions, Vol 12, No 1, p 60-68, January-February, 1969. 9 p, 21 fig, 3 tab, 34 ref.

Descriptors: *Erosion control, *Semiarid climates, *Geomorphology, Sediment yield, Streamflow, Drainage systems, Hydrologic properties, Vegetation, Precipitation (Atmospheric), Topography, Slopes, Runoff, Geology, Channel morphology, Sands, Channel erosion, Drainage patterns (Geologic), Rainfall-runoff relationships.

Erosional and depositional phenomena from a geomorphic perspective are evaluated from about 10 years of research concerning semiarid landforms. Emphasis on the processes of landscape modification and a quantitative description of landforms has provided information on the origin of certain features, and a means of delineating critical areas of the landscape where conservation techniques should be most effective. Related pictures, tables, and graphs are included. (Woodard-USGS)

EROSION-CONTROL PROBLEMS AND PRACTICES ON NATIONAL FOREST LANDS,
Forest Service (USDA), Logan, Utah. Div. of Soil and Water Management.
S. L. Cuskelly.
American Society of Agricultural Engineers Transactions, Vol 12, No 1, p 69-70, 85, January-February, 1969. 3 p.

Descriptors: *Erosion control, *National forests, Vegetation, Watershed management, Runoff, Sediment yield, Precipitation (Atmospheric), Forests, Reclamation, Soil stabilization.
Identifiers: Artificial seeding, Restoration, National Forests.

This paper reviews some of the procedures and equipment used in the restoration of national forest watersheds since the days of the civilian conservation corps in the 1930's including contour trenching, contour furrowing, and streambank and gully stabilization. Problems that still confront us are emphasized such as in the intermountain region national forests there are about 1,380,000 acres of rangeland and 860,000 acres of critical watershed area in need of rehabilitation. There are 5,900 miles of road and 3,240 miles of streambank needing stabilization. As watershed values increase and demands for restoration (and for that matter, all uses and activities) become even greater, these problems must be solved. (Woodard-USGS)
W71-00606

EROSION PROBLEMS AND CONTROL PRACTICES ON FEDERAL DOMAIN LANDS,
Bureau of Land Management, Logan, Utah.
Myrvin E. Noble.
American Society of Agricultural Engineers Transactions, Vol 12, No 1, p 71-74, January-February, 1969. 4 p, 2 fig, 2 tab.

Descriptors: *Erosion control, *Federal Government, Natural resources, Runoff, Sediment yield, Precipitation (Atmospheric), Streamflow, Vegetation, Conservation.
Identifiers: Federal domain lands, Bureau of Land Management, Western states.

Some of the most severe soil loss problems in the United States occur on the 174 million acres of leftover public domain remnants located mostly in 10 western states. These are lands administered by the Bureau of Land Management (BLM). In addition, the bureau has jurisdiction over 278,000,000 acres in Alaska; but it is this residue in the western conterminous states, after decades of government-allowed land entries, grants, reservations, and withdrawals, that presents a picture of critical depletion. This report reviews the problems and objectives concerning the conservation of these lands. Related information is presented in tables and maps. (Woodard-USGS)

FOREST SERVICE RESEARCH IN EROSION CONTROL,
Forest Service (USDA), Ogden, Utah. Intermountain Forest and Range Experiment Station.
Otis L. Copeland.
American Society of Agricultural Engineers Transactions, Vol 12, No 1, p 75-79, January-February, 1969. 5 p, 8 fig, 1 tab, 21 ref.

Descriptors: *Erosion control, *Federal government, *Watershed management, Precipitation (Atmospheric), Runoff, Streamflow, Sediment yield, Floods, Soil stabilization, Vegetation, Forests, Range management.
Identifiers: Forest service research, National Forests.

Functions of the U.S. Forest Service relating to factors that affect erosion processes, erosion-prevention actions, and erosion-control practices in watershed management research are described. Specific projects directly studying soil erosion processes and control are as follows: (1) Intermountain Station - Streamflow regulation and sediment reduction in northern Rocky Mountain forests, Preventing of controlling accelerated erosion of unstable forest soils, and Watershed protection requirements and rehabilitation measures to reduce flood runoff, erosion, and sediment from deteriorated rangelands and grazed forested areas; (2) Pacific Northwest Station - Soil stabilization and runoff regulation in conifer watersheds in Washington and Oregon, Water-yield improvement and erosion control - mid-Columbia River basin forests, and Erosion and sediment reduction, Alaska coastal forests; (3) Pacific Southwest Station - Hydrologic analysis methods, Flood and sediment reduction in the coniferous timber zone of California, and Flood and sediment reduction in steep, unstable brushlands of the Southwest; and (4) Rocky Mountain Station - Water-yield improvement and erosion control for montane and subalpine forests and rangelands, Improvement of water yields and soil stabilization: Big Horn, Powder River, and the North Platte River basins, Watersheds rehabilitation to control erosion and sedimentation in the Southwest, and Improvement of water yields and soil stabilization in the Black Hills. As of April 30, 1967, forty-two active studies relating to soil erosion were being conducted by these 13 projects. (Woodard-USGS)

STUDY OF EROSION IN ROADSIDE DRAINAGE CHANNELS IN NORTH CAROLINA,
North Carolina State Univ., Raleigh. School of Engineering.
Michael Amein, and H. L. Chu.
Available from NTIS as PB-191 398, $3.00 in paper copy, $0.95 in microfiche. September 1969, 63 p. Appendix to Project ERD-110-68-4.
Identifiers: *Roads, Drainage, *Erosion, Roads, Site selection, Sampling, Soil mechanics, Stability,

Statistical data, North Carolina, Ditches, *Drainage channels.

As part of an effort to establish criteria for the design of roadside drainage channels, a survey of many sites was made along the North Carolina highways. The survey consisted of measurement of the size of the contributing surface areas to the drainage, the measurement of the channel slope, the measurement of the channel cross section, identification of the surface cover, identification of points of incipient and severe erosion, identification of the extent of erosion and finally, testing of the soil samples. The soil test included sieve analysis and determination of the Atterberg limits. In addition, the location of each test site was marked on an area map. The results of this survey have been used to develop guidelines for the design of roadside channels. From these guidelines, the designer can hopefully predict whether a particular roadside channel (earth or grass) will be resistant to erosion and remain stable or whether there is a greater probability for erosion. In the latter case the use of a more resistant surface treatment such as paving would be recommended. This Appendix contains data and information which were used in the study on roadside drainage channels.

RANGE RESOURCES AND WATERSHED MANAGEMENT--A NEED FOR RESEARCH,
Utah State Univ., Logan. Dept. of Range Science.
Gerald F. Gifford.
Utah Science, Utah Agricultural Experiment Station, Utah State University, September 1968, Vol 29, No 3, p 90-91, 2 fig.

Descriptors: *Watershed management, *Land management, *Range management, *Watersheds (Basins), *Optimization, Vegetation, Arid lands, Water conservation, Soil conservation, Precipitation (Atmospheric), Runoff, Overland flow, Utah, Sedimentation, Erosion, Rainfall-runoff relationships, Soil-water-plant relationships, Ranges, Alpine, Multiple purpose projects, Resource development, Research and development, Hydrologic aspects, Water loss, Water utilization, Climatic data.
Identifiers: *Watershed research, *Range-resources research, *Range resources, *Watershed optimization, Turbulent runoff, Plant-soil complexes.

An important function of rangelands is receipt and disposal of precipitation of high and low intensity. Because Utah has abundant range resources, condition and trend of high-and low-elevation vegetation and their soils are important in determining how such areas respond to rain and snow. Knowledge of precipitation and turbulent runoff (overland flow) is requisite to planning by resource managers. Questions arise concerning the occurrence, form, amount, distribution, frequency and modification of rainfall, and erosion, sedimentation, land deterioration, improvement practices, protection criteria, watershed treatment and field analysis. Watershed optimization includes management of (1) soil-cover maintence; (2) multiple range-improvement practices; (3) quantification of flood and sediment-discharge sources; and (4) remedial measures. Multiple-use management requires analysis, protection, repair, utilization and maintenance of watershed areas for optimum control and conservation of water. Through research, education and extension, watershed unknowns may be recognized, defined and quantified. Problems include watershed differences, plant-soil complexes, water interception, cost benefits, erosion minimization, channel losses, chemical defoliation and physiological effect on water loss. These concepts are of particular importance in arid and semiarid areas. (Popkin-Arizona)

5A. Identification of Pollutants

STORM WATER POLLUTION FROM URBAN LAND ACTIVITY, DEVELOPMENT OF ANALYTICAL PROCEDURES FOR PREDICTING STORM WATER POLLUTION FROM URBAN AREAS BY USE OF SELECTIVELY DEFINED URBAN CHARACTERISTICS.
Avco Economic Systems Corp., Washington, D.C.

Available from NTIS as PB-195 281, $0.95 in microfiche. Also for sale by the Superintendent of Documents, US Government Printing Office, Washington, DC 20402. Price $2.00 SOD I67.13/4: 11034FKL 07/70. Water Pollution Control Research Series, 11034FKL 7/70, July, 1970. 325 p, 89 tab, 66 fig, 29 ref, 14 append. FWQA Program No 11034 FKL, Contract No 14-12-187.

Descriptors: Storm runoff, Storm drains, Urbanization, *Land use, Oklahoma, Cities, *Analytical techniques, Drainage systems, Water pollution control, Pollution abatement.
Identifiers: Tulsa (Okla), *Storm water pollution, Urban runoff.

An investigation of the pollution concentrations and loads from storm water runoff in an urban area was conducted in Tulsa, Oklahoma. The scope of the project included: a field assessment of the storm water pollution by obtaining samples of the water resulting from precipitation and surface runoff from selected test areas within the metropolitan area; development of an analytical procedure for correlation of storm water pollution with selectively defined variables of land uses, environmental conditions, drainage characteristics, and precipitation; and development of a plan for implementing remedial measures necessary to abate or control sources of pollution in an urban area. Storm water runoff samples were collected from 15 'discrete' test areas in the Tulsa metropolitan area for laboratory analysis in terms of quality standards for BOD, COD, TOC, organic Kjeldahl nitrogen, soluble orthophosphate, chloride, pH, solids, total coliform, fecal coliform, and fecal streptococcus pollutants. Selected land use parameters, environmental conditions, drainage and precipitation data, along with storm water pollution factors, provided input data for functional relationships to enable assessment of pollution from storm water runoff. Recommendations were made for a plan of action for preventing and controlling storm water pollution from urban areas.
W71-00619

OIL TAGGING SYSTEM STUDY.
Melpar, Falls Church, Va. Environmental and Applied Sciences Center.

Available from NTIS as PB-195 283, $0.95 in microfiche. Also for sale by the Superintendent of Documents, US Government Printing Office, Washington, DC 20402. Price $1.50 per copy. I67.13/4: 15080DJ5/70. Federal Water Pollution Control Research Series DAST-11, May, 1970. 115 p, 7 tab, 8 fig, 174 ref. FWPCA Project 15080 DJQ 05/70, Contract No 14-12-500.

Descriptors: Marking techniques, Tracing techniques, *Tagging, Oil wastes, Oil industry, Pollutant identification, Analytical techniques, Tracers, Chemical analysis, Chromatography, Waste identification, Water pollution control.
Identifiers: *Oil tagging, *Surveillance, Enforcement, *Oil pollution.

Several methods of identifying the source of oil pollution are critically examined. These methods are grouped into two categories: passive tagging and active tagging. Passive tagging assumes that oils are so chemically diverse that their contents constitute a stable chemical fingerprint that can be unequivocally disclosed in the laboratory. Active tagging requires that an inexpensive, coded material be added to oil; this material must be chemically and physically stable in both oil and oil slicks; it must also be readily identifiable by available analytical techniques; and it must have no adverse effect on the oil's subsequent use. Three methods of passive tagging (trace metals, sulfur-isotope ratios, and paper chromatography) and three methods of active tagging (halogenated polycyclic aromatics, organometallies, and coded microspheroids) have been examined. Passive tags cannot be recommended because the passive tags are quite likely to mingle, to evaporate, to be dissolved, or to be oxidized; even if these processes do not occur, they can create formidable forensic problems for the prosecution and telling counter-arguments for the defense. Since active tags are designed to be stable and identifiable, they are satisfactory for the job and the three types of active tags reviewed show promise and merit. (See also W70-04655).

FERTILIZER USE AND WATER QUALITY,
Agricultural Research Service, Beltsville, Md. Soil and Water Conservation Research Div.
G. Stanford, C. B. England, and A. W. Taylor.
U. S. Department of Agriculture, ARS 41-168, 1970. 19 p, 1 tab.

Descriptors: *Water quality, *Nitrates, *Phosphates, *Water pollution, *Nutrients, Agriculture, Agricultural chemicals, Farm management, Hydrologic cycle, Water balance, Soil water, Subsurface water.
Identifiers: Nitrogen cycle, Math models of water and nutrient balances, Soil and water conservation.

This publication evaluates the role of nitrogen and phosphorus fertilizers in water pollution and summarizes the research on the complex relationships between nutrient inputs and outputs. Available data do not often permit making valid estimates of nutrient transfer from fertilizer to ground and surface waters. A reliable basis for evaluating the effects of fertilizers on water quality requires quantitative measurements of water inputs and behavior in agricultural watershed studies that encompass appropriate ranges in climatic and management conditions. Future opportunities for manipulating the nitrogen balance in agriculture depend on further improvements in the technology of fertilizer use based on research. Practical methods must be developed for assessing not only the current nitrogen-supplying capacities of soils but also changes that result from fertilizer use. Such estimates, coupled with greater knowledge of nitrogen requirements of crops and of management practices needed for most efficient nitrogen use,

ovide the basis for realistically predicting fertil-
er needs of specific crops and meeting these
eds effectively under different soil and climatic
vironments. Precise control of fertilizer use de-
nds on gaining a better understanding through
search of the behavior of applied nitrogen and
osphorus in soils. For example, leaching and ru-
ff of nitrogen cannot be evaluated without a
tailed understanding of water balance and water
ovement in soils. Also, the chemical and biologi-
l processes of immobilization, mineralization,
d dentrification require further intensive study.

llection of Czechoslovak Chemical Communica-
ns, Vol 35, No 1, p 242-250, 1970. 3 fig, 14 ref.

scriptors: *Toxins, *Urine, Phenols, Analytical
chniques, Gas chromatography.
ntifiers: p-Cresol, Phosphoric acid, Carbon
ulfide, Dispersion coefficients.

The phenolic compounds of urine are liberated from the coagulated form by heating the sample with phosphoric acid. The sample is extracted with carbon disulfide containing p-nitrochlorobenzol as the internal standard. The extract is heated to 150C with 5% of 20 mole polyethyleneglycol and the contents of phenol and p-cresol are determined by a gas chromatograph. The uncertainly of p-cresol determination is largely excluded because the isomer m-cresol is seldom present in urine. For the optimum results, the hydrolysis of coagulated phenolic compounds should be investigated at different degrees of acidification with the aim of establishing the relation between the aqueous phase dispersion coefficients of phenols and p-cresols and the concentration of phosphoric acid. (Wilde-Wisconsin)

SUGGESTED CLASSIFICATION OF WATER QUALITY BASED ON BIOLOGICAL CHARACTERISTICS,
Wasserwirtschaftsdirektion Werra-Gera-Unstrut, Erfurt (East Germany).
Wolf Von Tumpling.
Proceedings of the Fourth International Conference on Water Pollution Research, held in Prague, 2-6 September 1968, Section I, Paper 16. 8 p, 2 fig, 3 tab, 27 ref.

Descriptors: *Classification, *Water quality, Biological properties, Bioindicators, Regression analysis, Statistical methods, Biochemical oxygen demand, Correlation analysis, Water pollution control, Dissolved oxygen, Oxygen.
Identifiers: Saprobity, *Water quality criteria, Mesosaprobic range, Saprobic index, Ammonium ion.

As a basis of water quality clssification of flowing waters, the author chose the biological state of waters. Four recommended water quality classifications based on organic pollution (biological state) and on oxygen budget are given. Class I includes waters of high purity which is suitable for all uses. Class II includes waters with a moderate pollution load and high self-purifying capacity. Class III waters are highly polluted and have an oxygen budget which is loaded to the limits of aerobic conditions. The author emphasizes the need to consider other water quality criteria such as toxicity and salinity. (Katz-Washington)

A RAPID EXTRACTION AND QUANTIFICATION OF TOTAL LIPIDS AND LIPID FRACTIONS IN BLOOD AND FECES,
Pittsburgh Univ., Pa. Dept. of Pathology.
J. S. Amenta.
Clinical Chemistry, Vol 16, No 4, 1970, p 339-346. 8 fig, 19 ref, 1 tab.

Descriptors: *Lipids, *Laboratory tests, Chemical analysis, Farm wastes.
Identifiers: *Feces, Plasma, Lipid fractions, Clinical laboratory, Cholesterol.

An analytical system for plasma lipids suitable for use in the large and small clinical laboratory is presented. Lipids are extracted into a chloroform-methanol solvent and concentrated into a chloroform phase by a wash with an aqueous CaCl2 solution. This extract is used to estimate total lipids and (after separation by thin-layer chromatography) the major lipid factions. A single acid dichromate reagent is used for all quantification of fecal lipids. Lipids in other body fluids can be conveniently analyzed with this flexible method. (Christenbury-Iowa State)

5B. Sources of Pollution

LEACHING OF CROP RESIDUES AS A SOURCE OF NUTRIENTS IN SURFACE RUNOFF WATER,
Agricultural Research Service, Morris, Minn.; and Minnesota Univ., Morris.
D. R. Timmons, R. F. Holt, and J. J. Latterell.
Water Resources Research, Vol 6, No 5, p 1367-1375, October 1970. 9 p, 8 tab, 8 ref.

Descriptors: *Leaching, *Nutrients, *Runoff, *Water pollution sources, Path of pollutants, Plants, Nitrogen, Phosphorus, Soil-water-plant relationships, Water quality, Eutrophication, Cycling nutrients.
Identifiers: Crop residues, Stubble.

Nitrogen and phosphorus losses were determined in plant leachates from alfalfa, Kentucky bluegrass, barley straw stubble, and oats straw stubble. Plant samples harvested from the field were either leached immediately or were desiccated by drying or freezing before leaching. The extraction of soluble nitrogen and soluble phosphorus in leachates from alfalfa and bluegrass was greatly increased by drying or freezing. These same treatments, however, released only small amounts of soluble phosphorus from barley and oats straw. Estimated soluble nutrient losses indicate that leaching of alfalfa and bluegrass by surface runoff water could contribute substantial amounts of nitrogen and phosphorus to lakes and streams. DOES ARTIFICIAL GROUNDWATER RECHARGE CONTAMINATE OUR GROUNDWATERS,
Texas Tech Univ., Lubbock. Dept. of Agricultural Engineering; Purdue Univ., Lafayette, Ind. Dept. of Agricultural Engineering.
Marvin J. Dvoracek, and Rolland Z. Wheaton.
Available from the NTIS as PB-195 304, $3.00 in paper copy, $0.95 in microfiche. Paper presented at the Agricultural Waste Management Conference, Cornell University, Rochester, New York, January 19-21, 1970. 19 p, 32 ref. OWRR Project No B-041-TEX (3).

Descriptors: *Artificial recharge, *Water pollution sources, *Water pollution control, Groundwater, Groundwater movement, Path of pollutants, Water resources development, Water quality.
Identifiers: Groundwater quality protection.

Artificial recharge practices produce the possibility that groundwaters may be polluted or contaminated by undesirable substances introduced with the recharge waters. Various methods of artificial recharge and the contamination potential of each method are discussed. (Knapp-USGS)
W71-00628

WATER QUALITY DEGRADATION BY SEPTIC TANK DRAINAGE,
Maine Univ., Orono. Water Resources Research Center.
Millard W. Hall.
Available from NTIS as PB-195 307, $3.00 in paper copy, $0.95 in microfiche. OWRR Project No A-014-ME (2).

Descriptors: *Eutrophication, *Water pollution sources, *Nutrients, *Septic tanks, *Maine, Soil disposal fields, Phosphates, Adsorption, Ion exchange, Clays, Soil chemistry, Soil chemical properties, Biodegradation, Path of pollutants.
Identifiers: Nutrient retention (Soils).

Phosphorus retention by Maine soils was studied in the Adams, Plaisted, and Paxton soil series. Jar tests were undertaken to determine the rate and extent of phosphorus fixation. Parameters investigated included pH, temperature, soil, particle size, initial soluble phosphorus concentration in the system, and time of exposure. Leaching studies were conducted to determine the effect of various ions on the leaching process, and freeze-thawing experiments were performed to investigate the travel of phosphorus under varying environmental conditions. Soil column studies were conducted, using both an aqueous solution of known phosphorus concentration, and a natural septic tank effluent so that the effects of the soil biota on the retention of phosphorus could be determined. All three soils exhibited a significant capacity for phosphorus retention, but this capacity could be exhausted. Therefore, extreme care should be used in locating septic tank-drainfield waste water disposal systems adjacent to lakes or other surface waters that may be subjected to cultural eutrophication. Moreover, freezing and thawing may allow phosphorus initially retained in the soil to be more easily leached into surface waters. (Knapp-USGS)

Available from NTIS as PB-195 310, $3.00 in paper copy, $0.95 in microfiche. Completion Report (1970). 12 p. OWRR Project A-025-RI (1).

Descriptors: *Virus elution, *Virus adsorption, *Gauze pad.

The ultimate objective of this study was to examine the viral flora of waters from estuaries, inland ponds and streams of Rhode Island. However, prior to carrying out field examination, it was necessary to evaluate under controlled laboratory conditions these methods currently available for sampling, concentration and isolation of viruses with a view to selecting the most effective method or designing a method which would simplify sampling and improve recovery. The methods evaluated included the gauze pad technique, adsorption and elution from chemical flocs, combined flocculation and centrifugation, sonnication, and finally adsorption and elution from magnetic iron ore. The gauze pad was found to be inefficient for recovering virus from fresh water but its efficiency was enhanced slightly by the presence of inorganic salts in water, e.g., sea water. Combined flocculation and centrifugation improved viral recovery, but shoewed selectivity in the viruses recovered. The best results were obtained by adsorbing virus onto magnetic iron oxide followed by elution with blood serum solutions.

JET DIFFUSION IN STAGNANT STRATIFIED WATERS,
Royal Inst. of Tech., Stockholm (Sweden).
Bengt Gustafsson, and Ian Larsen.
Water Research, Vol 4, No 5, p 353-361, May 1970. 9 p, 4 fig, 6 ref.

Descriptors: *Diffusion, *Jets, *Density stratification, Mixing, Dispersion, Turbulence, Density, Convection, Velocity, Path of pollutants, Density currents, Stagnant water.
Identifiers: Jet diffusion.

The rising of a jet due to buoyancy is discussed with special reference to horizontally injected jets in stratified fluids. A method for calculation of the maximum elevation of the jet is presented. The method is further simplified in the case of linearly varying density. The maximum value of surface density or salinity for which the jet will not be able to rise to the surface may be calculated. RADIOACTIVE WASTE DISCHARGES TO THE ENVIRONMENT FROM NUCLEAR POWER FACILITIES,
Bureau of Radiological Health, Rockville, Md.
Joe E. Logsdon, and Robert I. Chissler.
Available from NTIS as PB-190 717, $3.00 in paper copy; and $0.95 in microfiche. Bureau of Radiological Health, Division of Environmental Radiation Report BRH/DER 70-2, March 1970. 77 p, 4 fig, 10 tab, 33 ref, 9 append.

Descriptors: *Nuclear powerplants, *Nuclear wastes, *Radioactive wastes, *Water pollution sources, Surveys, Radioisotopes, Tritium, Nuclear energy, Nuclear reactors, Radioactive waste disposal.
Identifiers: Radioactive waste sources.

Data pertaining to discharges of radioactive liquid and gaseous wastes from nine selected operating nuclear power facilities are presented and discussed. Careful waste management practices, engineered safeguards, and proper operating procedures generally result in radioactivity levels in waste effluents of a few percent or less of the AEC's licensed discharge limits. Exceptions are mostly associated with either an unusually high percentage of leaky fuel elements or with liquid discharge limits which are artificially low as a result of not analyzing liquid wastes for radionuclide content. A number of comparisons were made of power produced versus liquid or gaseous waste discharges. The most predominant trends are that boiling water reactors discharge relatively large quantities of gaseous waste and pressurized water reactors discharge relatively high quantities of tritium in liquid wastes. No obvious trend is discernible concerning quantities of waste discharge as a function of power generation. (Knapp-USGS)

SOURCES OF PESTICIDES IN FLORIDA WATERS,
Geological Survey, Tallahassee, Fla.
Aaron L. Higer, and Milton C. Kolipinski.
Geological Survey Open-file Report 70005, January 1970. 20 p, 1 fig, 3 tab, 13 ref.

Descriptors: *Pesticides, *Water pollution sources, *Florida, Citrus fruits, Chlorinated hydrocarbon pesticides, Organophosphorus pesticides, Carbamate pesticides, Metal organic pesticides, Data collections, Sampling, Surface waters.
Identifiers: Pesticide use (Florida).

Information on use of pesticides was collected as part of studies of their occurrence in natural waters in Florida. The information is intended for use in designing programs to monitor and trace pesticides in the hydrobiologic system. Use of pesticides in Florida was found to be greatest in the areas of established and expanding agricultural activity, especially the central citrus belt and the north-central and southern truckfarming regions. Approximately 34.0 million pounds of chlorinated hydrocarbon, orgranophosphate, carbamate, and metallo-organic pesticides were used during 1966. Of this total 25.6 million pounds were applied for the control of pests on citrus, vegetables, and melons. Lesser amounts were used on other crops, on lawns, in homes, and for mosquito control. THE DEVELOPMENT OF THEORETICAL EQUATIONS TO DESCRIBE THE FLOW OF A RADIOACTIVE ION IN GROUNDWATER, ANNUAL REPORT, DECEMBER 1, 1966 - NOVEMBER 30, 1967,
Geological Survey, Denver, Colo.
David B. Grove.
Report available as SC-CR-68-3637 from NTIS, $3.00 in paper copy, $0.95 in microfiche. Sandia Laboratories, Report SC-CR-68-3637, October 1969. 58 p, 9 fig, 1 tab, 30 ref. Contract AT 848.

Descriptors: *Path of pollutants, *Tracers, *Ion transport, *Porous media, *Groundwater movement, Tracking techniques, Filtration, Ion exchange, Convection, Dispersion, Mathematical models, Hydraulic models, Radioactive wastes, Nuclear wastes, Radioisotopes.
Identifiers: Radioactive ion transport.

A one dimensional transport equation that includes convective, dispersion, and ion exchange terms is derived for the flow of trace concentrations of ions through porous media. Ion-exchange concepts

ined included instantaneous equilibrium, the use theoretical plates, and the assumption of a cond-order kinetic-rate reaction. The theoretical te and kinetic rate ion exchange concept com- red well with laboratory column experiments. e instantaneous equilibrium model's ease of use ts most attractive feature. A general partial dif- ential equation utilizing the kinetic concept to scribe the ion-exchange reaction was formulated o a finite difference equation by means of the ylor's series and solved by a digital computer. A crease in fluid velocity or an increase in the etic rate constant increases the peak concentra- n in the ionic pulse. High fluid velocities or low e constants result in early peaks in the effluent m a laboratory column. (Knapp-USGS)

E POTENTIAL DIGESTIBILITY OF CELLU- SE IN FORAGE AND FAECES,
iversity of New England, Armidale (Australia). pt. of Agronomy.
. Wilkins.
rnal of Agricultural Science, Vol 73, No 1, 59, p 57-64. 1 fig, 6 tab, 35 ref.

scriptors: *Farm wastes, *Cellulose, *Digestion, cubation, Grasses, Forages, Sheep, Nitrogen, rbohydrates, Organic matter, Analytical hniques.
ntifiers: *Potential digestibility, *Digestibility fficients, *Cellulose digestibility, Duration of estion, Rumen, Ryegrass, Cooksfoot, Callide odes grass, Samford Rhodes grass, Lignified and inized tissue.

e potential digestibility of cellulose is defined as maximum digestibility obtainable when the nditions and duration of digestion are not limit- factors. Techniques for measuring potential cel- ose digestibility were examined and the relation- p between potential digestibility and in vivo cel- ose digestibility was explored for a range of sses. Cellulose digestibility was found to reach a ximum value after 5 days incubation in vitro. No ther cellulose was digested when the residues from an initial incubation for 6 days were incubated with a second rumen liquor inoculum. The values measured after a single incubation of 6 days duration were similar to cellulose digestibility coefficients measured by the suspension of ground forage samples in nylon bags in the rumen for 6 days. Plant factors appear to limit further digestion and the residue from prolonged digestion in vitro consisted only of lignified and cutinized tissue. Potential cellulose digestibility measured by either of the above techniques was higher than cellulose digestibility in vivo. The difference varied between forages and when the difference was large, the digestibility of cellulose in faeces was high. It is suggested that measurements of the potential digestibility of cellulose in feed and faeces may be of use in estimating the digestibility of grazed herbage. (White-Iowa State)

SALMONELLA Spp. AND SEROTYPES OF ESCHERICHIA COLI ISOLATED FROM THE LESSER MEALWORM COLLECTED IN POULTRY BROODER HOUSES,
Minnesota Univ., St. Paul. Dept. of Entomology, Fisheries and Wildlife.
Philip K. Harein, Ernesto De LasCasa, B. S. Pomeroy, and Mabel D. York.
Journal of Economic Entomology, Vol 63, No 1, February 1970, p 80-82. 3 tab, 20 ref.

Descriptors: *Farm wastes, *Poultry, *Salmonella, *E. coli, Cultures.
Identifiers: *Isolated, *Brooder houses, Litter, Mealworms, Pathogens.

Adult Alphitobius diaperinus (Panzer) were collected from the litter of poultry brooder houses in 1967 and 1968. One thousand of the lesser mealworms were individually surface disinfected, mascerated, and cultured in thioglycolate enrichment broth at 37 degrees C and streaked on cosin methylene blue agar or brilliant green agar plates for detection of Escherichia coli (Migula) Castelani and Chalmers and Salmonella spp., respectively. Five species of Salmonella found within the lesser mealworms were identified as S. heidelberg Kauffman, S. worthington Edwards and Bruner, S. saint paul Kauffman, S. typhimurium var copenhagen Kauffman, and S. chester Kauffman and Tesdal. Forty-eight serotypes of E. coli were recovered from within 251 lesser mealworms. Twenty-six of these serotypes are known pathogens for man or animals. (Miner-Iowa State)

5C. Effects of Pollution

A NOTE ON BACTERIAL GROWTH AROUND A RECHARGE WELL AT BAY PARK, LONG ISLAND, NEW YORK,
Geological Survey, Mineola, N.Y.
John Vecchioli.
Water Resources Research, Vol 6, No 5, p 1415-1419, October 1970. 5 p, 3 tab, 6 ref.

Descriptors: *Injection wells, *Reclaimed water, *Bacteria, Water reuse, Artificial recharge, New York, Water quality, Tertiary treatment, Aquatic microorganisms, Aquatic microbiology, Aquifers, Water pollution effects.
Identifiers: Bay Park (NY), Long Island (NY).

Highly treated sewage plant effluent is injected into a deep sand aquifer at Bay Park, Long Island, New York. High bacterial counts are observed in water pumped initially from the injection well after recharge termination, even though the injected water generally meets potable standards. Moreover, the number of bacteria recovered during pumping is much larger than the number injected. This suggests a growth of bacteria in the aquifer around the injection well, possibly in part on a filter mat of organic material formed at or near the aquifer-gravel pack interface during injection. Continued pumping results in lower counts until virtually bacteria-free water is produced. However, whenever pumping is stopped and restarted, the initial slug of water pumped shows higher counts than before shutdown. Apparently the surging action of the water dislodges bacteria that otherwise would not enter the well. (Knapp-USGS)

STREAM POLLUTION IN THE 'NEW LEAD BELT' OF S.E. MISSOURI,
Missouri Water Resources Research Center, Columbia.
Bobby G. Wixson, and Hong-Wen Chen.
Available from NTIS as PB-195 285, $3.00 in paper copy, $0.95 in microfiche. Missouri Water Resources Research Center, Completion Report, August 1970. 17 p, 1 tab, 5 fig, 11 ref. OWRR- A-021-MO (1).

Descriptors: *Mining, *Lead, *Zinc, Water quality, Fluorides, Missouri, Water pollution effects.
Identifiers: Milling Reagents.

This project studied the effects of lead-zinc mining and milling pollution in the Viburnum Trend or 'New Lead Belt' of S.E. Missouri. Results obtained from the project included the following: Stream pollution below the mine discharge was mainly due to the growth of large algal mats of Oscillatoria and bacteria which appear to result from the discharge of sodium isoprophyl xanthate in the milling waste

water. Limits were established for the precipitation of lead, zinc, and copper in relationship to pH and other water quality parameters. The amount of fluorides in the streams may be used as an indicator of mining water discharges. New techniques may be used to evaluate organic milling reagents in the water and in the biota. Diatoms may be used as biological indicators of mine waste water effects.

POTENTIAL THERMAL EFFECTS OF AN EXPANDING POWER INDUSTRY: UPPER MISSISSIPPI RIVER BASIN,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Labs.
D. E. Peterson, and R. T. Jaske.
AEC Research and Development Report, BNWL-1405, UC-70 June, 1970, p 94. 22 fig, 21 tab, 17 ref. US AEC Contract AT (45-1)-1830.

Descriptors: *Thermal pollution, *Temperature, Computer models, Flow, Thermal power plants, Ice, Navigation, Precipitation (Atmospheric), Run off, Heat budget, Computer programs, Minnesota, Illinois, *Simulation, *Model studies.
Identifiers: Upper Mississippi, River Basin, Cooling capacity, Power growth, Heat sink, Thermal load.

Direct cooling capacities of the main stem Mississippi River and eight major tributaries between Royalton, Minnesota and Alton, Illinois for average and low flow conditions were simulated within a temperature constraint of 5F above natural background. Total assimilative and dissipative capacity of the upper Mississippi Basin ranged from a high of 130 GWT to a low of 46 GW sub T. Analyses of projected power growth patterns indicate that the main stem has adequate cooling capacity to accommodate forecasted loads through the year 1990, except in the St. Paul-Minneapolis area. Partial recirculatory cooling facilities appear to be a possible solution to tributary basin cooling water requirements beyond the year 1980. (Upadhyaya-Vanderbilt)
W71-00644

SIMULATION OF THE EFFECTS OF HANFORD AT THE WASHINGTON-OREGON BORDER,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Labs.
R. T. Jaske, and D. G. Daniels.
U. S. AEC Contract AT (45-1)-1830. AEC Research and Development, BNWL-1344, VC-70, July, 1970, p 33. 16 fig, 2 tab, 4 ref.

Descriptors: *Thermal pollution, Temperature, *Mixing, Isotherms, *Stratification, Heat transfer, Reservoirs, Depth, Oregon, Washington, Model studies, *Simulation.
Identifiers: Hanford plant, COLHEAT simulation model, Thermal discharge, Power level, Temperature transect, Columbia River.

A series of transects taken in the summer and fall of 1969 at the Oregon and Washington border are used as the basis for checking the accuracy of the COLHEAT simulation model and the extent of stratification and mixing which occurs in the reservoir under conditions where solar thermal input is at a maximum. The model is then used to estimate the extent to which heat additions at the Hanford Plant (Columbia River Mile 382) persist to the Washington-Oregon border (River Mile 308) under a range of statistically determined extreme and normal conditions expected after completion of the Columbia Treaty dams in 1975. The results show that 65% or more of the incremental addition to the temperature of the Columbia River between Priest Rapids dam and Richland is dissipated in the reach under study. The remaining 35% is only weakly related to the weather in terms of yearly variations. The study suggests the practicability of using computer simulation as the basis for management of stream standards using in situ stream conditions as the basis of the judgment. (Upadhyaya-Vanderbilt)

THE EVALUATION OF SPECIES COMPOSITION AS A QUALITATIVE FACTOR IN PRIMARY PRODUCTIVITY,
American Univ., Washington, D.C. Dept. of Biology.
Richard R. Anderson.
Chesapeake Science, Vol 10, No 3 and 4, Sept-Dec, 1969, p 307-312. 28 ref.

Descriptors: *Phytoplankton, *Chlorophyll, *Benthos, Marshes, *Periphyton, Sampling, Aquatic environment.
Identifiers: Infrared photography, Thermal addition, Cell count.

The older and largely obsolete method for sampling phytoplankton communities is the fine silk net. Problems encountered include variations in pore size due to manufacture degree of wetting, age and strain. Pumping known volume of water through suitable filters, which then can be washed to retrieve the phytoplankton, appears to solve sampling problems. Counting trays such as the Russel model or hemocytometer slide are used for determination of species and cell number with a microscope. Benthic and Periphylic plants make ideal indicators of species and biomass change within an area where environmental alteration is occurring, since the adults do not readily move to new areas. Investigations using SCUBA and underwater photography are only useful in water with relatively little sediment load. Bottom grabs or dredges appear to best facilitate benthos sampling. Anderson has found color in delineating major marsh plant communities. (Upadhyaya-Vanderbilt)

MEASURING DISSOLVED OXYGEN AS AN INDICATOR OF PRIMARY PRODUCTIVITY,
Rutgers-The State Univ., New Brunswick, N.J.
Kent Mountford.
Chesapeake Science, Vol 10, No 3 and 4, Sept-Dec, 1969, p 327-330. 14 ref.

Descriptors: *Dissolved oxygen, *Primary productivity, Polarographic analysis, Calibrations, Aquatic environment.
Identifiers: Light-dark bottle, Winkler method, Carbon fixation, Microgasometry, Manometry.

The estimation of primary productivity using dissolved oxygen data is predicted upon the relationship between oxygen evolution and carbon fixation. In the current Barnegat Ray investigation, the change in mg O2/l was multiplied by 0.375 to obtain a first order approximation of fixation of carbon into organic compounds. Gaarder and Gran first proposed the technique using light and dark bottles with the Winkler titration to measure the production and consumption of oxygen. The contribution of oxygen dissolved in the reagents, volatilization and air-oxidation of iodine in the transfer at aliquots for titration, and direct errors in burette reading and detection of the end point are the sources of error in the Winkler method. Polarographic techniques and their advantages are also described. Scholander described an elegant technique which requires only about 1 ml of sample for the determination of dissolved oxygen, even in polluted waters, with an accuracy of 2 percent. Manometry does not require the measurement of oxygen to estimate carbon fixation and, indeed can directly measure changes in CO2. (Upadhyaya-Vanderbilt)

THE USE OF ISOTOPES IN MEASURING PRI MARY PRODUCTIVITY,
Maryland Univ., College Park. Dept. of Botany.
Raymond A. Galloway.
Chesapeake Science, Vol 10, No 3 and 4, September - December 1969, p 331-335. 55 ref.

Descriptors: *Radioisotopes, *Primary productivity, Radioactivity, Incubation, Sampling, Time *Biomass, *Aquatic microorganisms.
Identifiers: 14C, Photosynthate, Dark fixation, Activity.

Primary production is most often based on either the rate of carbon assimilation or the rate of oxyge production. One of the most sensitive measures primary production is by 14C-technique original developed by Steemann and Nielsen (J. Con Perm. Int. Explor. Mer. 18: 117-140, 1952). Me sured water samples are placed in bottles togeth with known amounts of 14C, usually in the form bicarbonate. Bottles were exposed to approximat ly 2000 foot-candles of illumination for 3 to 6 hou in a bath. After incubation, cells were filtered a washed in sea water. The filters were dried for hours and exposed to fuming HCL to remove absorbed organic carbon before making radioa tive counts. Time and sampling are the problem this procedure. Another problem inherent in t approach is that of dark CO2 fixation. Loss of 1 can also occur from normally functioning, livi cells. Contains 55 references. (Upadhyaya-Va derbilt)

EFFECT OF TEMPERATURE ON OXYGE TRANSFER IN WATER,
Windsor Univ. (Ontario); Tennessee Val Authority, Chattanooga; and Wisconsin Un Madison.
Jatinder K. Bewtra, William R. Nicholas, and Lawrence B. Polkowski.
Water Research, 1970. Vol 4, No 1, p 115-1 January 1970. 5 fig, 1 tab, 11 ref.

Descriptors: *Temperature, *Aeration, Reae tion, Regression analysis.
Identifiers: Saran tubes, Spargers, Oxygen trans rates, Air flow rates.

The effect of temperature on oxygen transfer diffused-air aeration is presented. The study made in a full scale aeration tank using both sa tubes and spargers as the diffusion media at a tion rates from 7 to 32 ft 3 per min. per foot of t length. The oxygen transfer was measured in w through a temperature range of 10-30C in 2.5C crements. In an aeration tank with bubble aera at a given rate, the percent ratios of the rates of ygen absorbed to the oxygen supplied in tap w are the same, at temperatures between 10C 30C and zero dissolved oxygen concentration. value of K sub L A changes with temperature according to the equation (K sub L A) sub T e (K sub L A)20C (T-20), where A is the interfa contact area between air bubbles and liquid, a sub L is the over all transfer coefficient. The v of C for the aeration devices, saran tubes, and s gers, was found to be 1.0192. Airflow rates w the range of 7-32 cu ft per min per foot tank le have no significant effect on this constant. (U hyaya-Vanderbilt)

CHLOROPHYLL ANALYSIS AS A METHOD EVALUATING THE STANDING C PHYTOPLANKTON AND PRIMARY PROD TIVITY,
Maryland Univ., Solomons. Natural Resources
David A. Flemer.
Chesapeake Science, Vol 10, No 3 and 4, tember-December 1969. p 301-306. 51 ref.

Descriptors: *Chlorophyll, *Primary product Standing crop, *Phytoplankton, Aquatic env ment.
Identifiers: Assimilation number, Absorption ficient.

ie accuracy of chlorophyll a determination is sub-
ct to important errors resulting from chlorophyll
gradation products, as are determinations for
ier chlorophylls which have absorption maxima
ar that of chlorophyll a. This problem is espe-
lly likely to occur in shallow estuaries where bot-
n deposits are resuspended by wind and tidal
rrents or in samples collected from fixed sub-
ates, e.g., glass slides. Choice of specific absorp-
n coefficient, and the nature of pure pigments
ed for calibration can affect the spec-
photometric estimation of chlorophyll. (Upad-
aya-Vanderbilt)

atoms, Chlorophyta, Cyanophyta, Daphnia,
ails.

Identifiers: Lake Ersom (Denmark).

Bottom fauna fits into an ecological pattern set by primary production of algae, submerged macrophytes, and physical and chemical factors. The physicochemical factors affect size and seasonal trend of primary production. In turn, primary production determines range of various physical and chemical factors at the bottom. Phytoplankton production, vertical distribution and abundance of macrophytes are important determinants of oxygen regime, alkalinity, pH, and other factors especially important in relation to vertical and temporal variation. Bottom fauna is correspondingly affected in quality, quantity, and depth distribution. Above the thermocline is a rich fauna with high oxygen demands; below the thermocline are a few specialists tolerating low oxygen tension. These qualitative contrasts are paralleled by quantitative contrasts. Increasing nutrients to epilimnion results in increased standing crop and phytoplankton production. Macrophytes climb to compensate for decreased illumination. Lake changes into one devoid of submerged vegetation, dominated by Nymphoids showing only the lower peak of animal biomass. Increasing nutrients to hypolimnion causes rapidly developing oxygen deficit, lowering respiratory activity, reducing growth periods, and other adverse effects on bottom fauna. During final stage of eutrophication, sessile mud-dwellers may drop to almost zero or become restricted to Oligochaetes. (Jones-Wisconsin)

INTERACTION OF PESTICIDES WITH NATURAL ORGANIC MATERIAL,
Geological Survey, Denver, Colo.
R. L. Wershaw, P. J. Burcar, and M. C. Goldberg.
Environmental Science and Technology, Vol 3, No 3, p 271-273, 1969. 3 fig, 1 tab, 9 ref.

Descriptors: *Pesticides, *DDT, 2-4-5-T, Adsorption, Solubility, Organic matter, Water pollution, Humic acids, Surface tension.
Identifiers: Organic polyelectrolytes, Langmuir adsorption equation, Lauryl sulphate solution.

By lowering the surface tension of water, organic polyelectrolytes, such as humic acid, facilitate solubility of otherwise insoluble pesticides. On the other hand, the high adsorption capacity of humate fraction precludes an uptake of eradicants by the roots. These relationships were demonstrated by the use of sodium humate and humic acid to solubilize the DDT and adsorb the 2,4,5-T from solution. (Wilde-Wisconsin)

A PREDATOR-PREY RELATIONSHIP. SEA STARS-BIVALVES. THE CHEMICAL BASIS OF THE RESPONSE OF ASTERIAS VULGARIS TO CRASSOSTREA VIRGINICA. A BIOASSAY, ITS APPLICATIONS AND THE PARTIAL PURIFICATION OF AN ACTIVE EXTRACT,
Woods Hole Oceanographic Institution, Mass.
K. J. Whittle, and M. Blumer.
Available from NTIS as AD-708 682, $3.00 in paper copy, $0.95 in microfiche. Technical Report, May 1970. 77 p. Reference No 70-20.
Identifiers: *Echinodermata, Responses, *Pelecypoda, Secretion, *Secretion, Chemical analysis, Chemicals, Stimulation, Purification, Ecology, Water pollution, Oceans, Sensory perception, Thresholds (Physiology), Sensitivity, Marine biology, Biological assay, *Asterias vulgaris, *Crassostrea virginica, *Chemotaxis, *Predation.

The chemical basis of the predator/prey relationship, sea stars/bivalves, was examined. Under controlled conditions in a flow-tank, Asterias vulgaris senses intact oysters (Crassostrea virginica) upstream at distances of at least 120 cm. and shows a positive chemotaxis. It responds similarly to aqueous extracts of oyster tissue at concentrations as low as a few parts per billion. The threshold sensitivity of Asterias vulgaris and Asterias forbesi for an oyster extract was compared. It was measured also for A. vulgaris relative to other bivalves. Contamination of the testing tank with particulate suspensions and oil dispersions at concentrations of less than 10 10 mg/liter is sufficient to decrease the response to oyster extract and to lower the threshold sensitivity of the sea stars. A reliable, repeatable method was developed for the partial purification of the oyster extract. Infrared spectroscopy indicates that the major functional groups are -OH, -NH and -COOH. It is probable that the activity is centered in a number of polar, low molecular weight compounds. They are heat stable at 100C stable to acid, and not hydrolyzable.

THE EFFECT OF SALINITY ON THE REMOVAL OF SOME ALIPHATIC KETONES,
Texas A and M Univ., College Station.
Tariq A. Mahmoud, and William B. Davis.
Available from NTIS as PB-193 401, $3.00 in paper copy, $0.95 in microfiche. July 1970, 106 p. Sea Grant Publication No. TAMU-SG-70-216.
Identifiers: *Water pollution, *Organic compounds, *Microorganisms, Salinity, Ketones, Aliphatic compounds, Wastes (Industrial), Control, Metabolism, Estuaries, Physiology, Bacteria, Pseudomonas, Fungi, Theses, Cephalosporium.

Basic and definitive information pertaining to the effect of salinity on the microbial behavior is essential to determine the fate of organic pollutants discharged into the estuaries, and to determine design and operation parameters of plants subjected to salinity variation. Twenty-five batch tests were run to determine the long and short term effect of salinity variation on the microbial behavior of cultures established in various salinity levels and tested under different salinity conditions. Aliphatic ketones namely, acetone, 2-butanone and 2-pentanone were used as a carbon source in this study because of their appearance in many industrial wastes. Organisms acclimated to ketones in media varying from fresh water to sea water salinity were identified to genera and in two instances to species. The following conclusions were observed: (1) Two predominant genera, Cephalosporium and Psendomonas, were common to all salinity levels. (2) Minor species were displaced with the progressive increase in salinity level. These two observations lend credence that a reduced removal rate at a higher salinity level was due not to the change in population structure but to the physiological effects of the increase salinity on the uptake and metabolism of the substrate by organisms.

STUDIES ON WATER QUALITY AND THE ABSENCE OF FISH FROM SOME POLLUTED ENGLISH RIVERS,
Water Pollution Research Lab., Stevenage (England).
V. M. Brown, D. G. Shurben, and D. Shaw.
Water Research, Vol 4, No 5, p 363-381, May 1970. 19 p, 12 fig, 8 tab, 24 ref.

Descriptors: *Water pollution effects, *Toxicity, *Fishkill, *Poisons, Estuaries, Fish, Morbidity, Mortality, Industrial wastes, Water pollution, Rivers, Water quality, Ammonia, Copper, Phenols.
Identifiers: Cyanide, Zinc, England.

Field studies were made in England to determine the acute, lethal toxicity of some polluted river waters and an estuary water to rainbow trout, brown trout, roach, and dace. The 48 hr median lethal concentrations, for rainbow trout, of dilutions of the polluted fresh waters were found to be about 65 per cent of those predicted from the chemical qualities of the waters. Prediction seriously underestimated the toxicity of the saline waters. (Knapp-USGS)
W71-00834

EFFECTS OF COPPER ON GAMMARUS PSEUDOLIMNAEUS, PHYSA INTEGRA, AND CAMPELOMA DECISUM IN SOFT WATER,
National Water Quality Lab., Duluth, Minn.
John W. Arthur, and Edward N. Leonard.
Journal of the Fisheries Research Board, Canada, Vol 27, No 7, p 1277-1283, 1970. 5 tab, 12 ref. FWQA Program 18050---9/70.

Descriptors: *Heavy metals, *Copper sulfate, *Amphipoda, *Snails, *Bioassay, Life history studies, Toxicity.
Identifiers: *Chronic copper toxicity, *Acute copper toxicity, Safe toxicity levels, Continuous flow bioassays.

Three invertebrate species were subjected to acute (96-hr) followed by long-term (6-week) copper exposures under continuous flow bioassay conditions. Survival, growth, reproduction, and feeding were the responses used for measuring toxicant effects. The average 96 hr TLm values for Campeloma decisum, Physa integra, and Gammarus pseudolimnaeus were 1.7, 0.039, and 0.020 mg/liter total copper, respectively. The total copper concentration having no effect after 6 weeks' exposure for all three species, was between 8.0 and 14.8 micrograms/liter. The newly hatched amphipods obtained from the second six week study were exposed to copper for 9 additional weeks, and grew to the adult stage only in copper concentrations less than or equal to 4.6 micrograms/liter. After 5 weeks' exposure to a water system, survival of newly hatched Gammarus was markedly reduced between copper concentrations of 12.9 and 6.2 micrograms/liter.
W71-00907

CHRONIC EFFECTS OF LINEAR ALKYLATE SULFONATE DETERGENT ON GAMMARUS PSEUDOLIMNAEUS, CAMPELOMA DECISUM, AND PHYSA INTEGRA,
National Water Quality Lab., Duluth, Minn.
John W. Arthur.
Water Research, Vol 4, No 4, p 251-257, 1970. 4 tab, 17 ref. FWQA Program 18050---10/70.

Descriptors: *Detergents, *Amphipoda, *Snails, *Bioassay, Toxicity, Life history studies.
Identifiers: *Chronic detergent toxicity, *Acute detergent toxicity, Safe toxicity levels, Continuous flow bioassays.

Three invertebrate species were submitted to acute (96 hr) followed by chronic (6 week) detergent exposures. The average 96 hr TLm values for Campeloma decisum, Physa integra, and Gammarus pseudolimnaeus were 27, 9, and 7 mg/l linear alkylate sulfonate (LAS), respectively. Newly hatched amphipods that were covered after termination of the second 6 week study were further exposed to the detergent for 15 additional weeks, thus enabling more than one generation cycle to be tested under toxicant stress. Survival, growth, reproduction, feeding, and mobility were the responses used for determining the chronic toxicant effects. Under the test conditions described, the maximum acceptable LAS concentrations for Gammarus pseudolimnaeus and Campeloma decisum were between 0.2-0.4 and 0.4-1.0 mg/l, respectively. Responses by Physa integra were not significantly altered under the chronic test concentrations.
W71-00908

EFFECTS OF ABATEMENT OF DOMESTIC SEWAGE POLLUTION ON THE BENTHOS, VOLUMES OF ZOOPLANKTON, AND THE FOULING ORGANISMS OF BISCAYNE BAY, FLORIDA,
Miami Univ., Fla. Inst. of Marine and Atmospheric Sciences.
Kneeland J. McNulty.
Studies in Tropical Oceanography No 9, University of Miami Press, Coral Gables, Florida, March 1970. 107 p, 19 fig, 10 tab, 155 ref. FWQA Program 18050-03/70.

Descriptors: *Water pollution effects, Domestic wastes, *Pollution abatement, Water pollution control, Benthos, *Benthic fauna, *Benthic flora, Zooplankton, Florida, Comparative productivity, Aquatic environment, Aquatic populations, Dredging, *Bottom sediments, Phosphorus, *On-site investigations, On-site data collections, Amphipoda, Water quality.
Identifiers: Fouling organisms, *Biscayne Bay, Florida, Barnacles, *Bottom communities, Literature review.

Various elements of the biota of northern Biscayne Bay, Florida, were studied before and after abatement of pollution. The pollution consisted of 136 to 227 million liters per day of untreated domestic sewage. Four years after removal of the pollution certain changes had taken place. At distances of 100 to 740 meters seaward from outfalls, in water depths of one to three meters in hard bottom, populations of benthic macroinvertebrates had declined from abnormally large numbers of species and individuals to normal numbers of each, while soft-bottom populations had changed qualitatively but not quantitatively. Adjacent to outfalls, populations had increased in numbers of species and numbers of individuals in hard sandy bottoms only. Volumes of zooplankton had decreased to about one-half the pre-abatement values in poorly flushed waters; elsewhere, they remained about the same. Dissolved inorganic phosphate-phosphorus decreased similarly. Abundance of amphipod tubes had declined markedly, a change not shared by the quantities of other fouling organisms (including barnacles), which remained about the same. There was no evidence of improved commercial and sport fishing following abatement; this is interpreted to mean that long-lasting detrimental effects have resulted from pollution and dredging. (Katz-Washington)
W71-00919

INFLUENCE OF OXYGEN CONCENTRATION AND WATER MOVEMENT ON THE GROWTH OF STEELHEAD TROUT AND COHO SALMON EMBRYOS,
Oregon State Univ., Corvallis. Dept. of Fish and Game Management.
Dean L. Shumway, Charles E. Warren, and Peter Doudoroff.
Transactions of the American Fisheries Society, Vol 93, No 4, 1964, p 342-356. 10 fig, 3 tab, 3 ref.

Descriptors: *Water pollution effects, Oxygen requirements, *Dissolved oxygen, Water temperature, *Fish eggs, Fish management, Fish physiology, Growth rates, Environmental effects, *Embryonic growth stage, *Hatching, Laboratory tests, Salmonids, Mortality, Regression analysis, Viability.
Identifiers: *Coho salmon, *Steelhead trout, *Water movement, Water velocities, Hatching time.

Embryos of coho salmon and steelhead trout were reared from fertilization of the eggs to hatching, at about 10 degrees C, at different concentrations of dissolved oxygen ranging from about 2.5 to 11.5 mg/liter and at different water velocities ranging from about 3 to 750 cm/hour. Some of the embryos rested on porous plates, while others were buried in glass beads so as to simulate natural conditions more closely. Fry from embryos reared at low and intermediate oxygen concentrations hatched later and were smaller in size at hatching than fry from embryos reared at concentrations near the air-saturation level. At all oxygen concentrations tested, reduced water velocities resulted in reduced size of hatching fry. This effect of velocity was nearly as pronounced at high oxygen concentrations as at low concentrations. The effect of the difference of water velocity tested was less than the effect of the difference of oxygen concentrations tested. When some embryos were buried in glass beads while others were not, and the discharge rates of water through cylinders containing the embryos were the same, the fry that hatched in the cylinders containing beads were larger in size than those in cylinders without beads. This effect is ascribed to the increase of water velocities around the embryos buried in beads. It was usually most pronounced when a mixture of large and small beads was used. (Katz-Washington)
W71-00920

THE ACUTE LETHAL TOXICITY TO RAINBOW TROUT OF MIXTURES OF COPPER, PHENOL, ZINC AND NICKEL,
Water Pollution Research Lab., Stevenage (England).
V. M. Brown, and R. A. Dalton.
Journal of Fisheries Biology, Vol 2, p 211-21 1970. 2 fig, 3 tab, 11 ref.

Descriptors: *Bioassay, Toxicity, *Copper, *Phenols, Heavy metals, Rainbow trout, Lethal limit, Water pollution effects, Copper sulfate, Estimating.
Identifiers: *Zinc, Nickel, Toxic mixtures, Fractional toxicities, *Predicted toxicity.

The acute lethal toxicities to rainbow trout, Salmo gairdneri Richardson, of mixtures of copper and phenol, of copper, zinc and phenol, and of copper, zinc and nickel, over an exposure period of 48 were determined. The 48 - h LC50 values were 1.17, 1.07, and 1.01 mg/l, respectively. The concentrations selected for testing were such that each poison theoretically contributed equally to the toxicity of the mixture. It was found that the toxicity of these mixtures could be adequately predicted by summation of the fractional toxicities of the particular poisons which were present. (Katz-Washington)
W71-00921

THYROXINE ANTAGONISM OF PENTACHLOROPHENOL POISONING IN CICHLID FISH,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
James N. Pasley, George G. Chadwick, and Hugo Krueger.
Proceedings of the Western Pharmacology Society II, p 129-132, 1968. 3 tab, 12 ref. USPHS Grants ITI GM 1192 and EF 105.

Descriptors: Phenols, Cichlids, *Fish physiology, Mode of action, Animal metabolism, *Biochemistry, *Growth rates, Lipids.
Identifiers: *Thyroxine, Antagonism, *Pentachlorophenol, Ash content, Protein content.

Control cichlids had higher wet weight, dry weight, lipid and water content than the cichlids exposed to thyroxine (T) alone or to sodium pentachlorophenol (NaPCP) alone. Protein and

ıtent of control cichlids did not vary markedly m those exposed to thyroxine or to NaPCP. The nbination of T.. NaPCP led to an increase in wet ight, dry weight, and lipid and protein fraction ıtent above that of control cichlids. Thyroxine ne and NaPCP alone reduced growth, but when hlids were exposed to a combination of both stances a somatotropic effect was exerted. The nges from controls in weights of water, fat, ash, protein fraction were not proportional and thus osure to Thyroxine, NaPCP, and T..NaPCP al- ed the composition of the cichlids. (Katz- shington)

FECT OF DIETS CONTAINING HYDRATED POULTRY WASTE ON QUALI- CHANGES IN SHELL EGGS DURING ORAGE,
chigan State Univ., East Lansing. Dept. of ltry Science.
R. York, C. J. Flegal, H. C. Zindel, and T. H. eman.
ltry Science, Vol 49, No 2, p 590-591, March 0. 1 tab, 3 ref.

criptors: *Farm wastes, *Poultry, *Dehydra- , *Diets, Eggs.
ntifiers: *Haugh unit, *Qaulity changes, Color odor observations, Waste feeding, Manure ization, Dried poultry wastes.

s from 32 Leghorn-type hens on each of four s were used. All the birds were 10 months of and had been on the experimental diet for three nths. The diets used were (1) control, (2) con- with 10% DPW, (3) control with 20% DPW, (4) control with 30% DPW. One-day-old eggs e stored at room environment to accelerate the nges that occur during storage. Room tempera- varied from 22 degrees C to 25 degrees C and tive humidity varied from 50% to 68%. Eggs e gathered on five consecutive days and held storage periods of 10, 20, 30, 40 or 50 days. sical and microbiological examinations were le at the beginning of the trial and at the end of designated storage periods. The results of this eriment indicate that including 10, 20, or 30% ydrated poultry waste in the diet of hens had no ificant deleterious effect on the quality of shell s as measured by Haugh units, storage weight , color, odor, and/or microbial content. E EFFECT OF ANIMAL DENSITY AND SUR- CE SLOPE ON CHARACTERISTICS OF RU- FF, SOLID WASTES AND NITRATE MOVE- NT ON UNPAVED BEEF FEEDLOTS,
raska Univ., Lincoln. Agricultural Experiment ion.
. Gilbertson, T. M. McCalla, J. R. Ellis, O. E. ss, and W. R. Woods.
lication SB508, June 1970. 23 p, 5 fig, 7 tab, 23

criptors: *Rainfall-runoff relationships, emical analysis, *Farm wastes, Chemical ox- n demand, Biochemical oxygen demand, Cattle, oratory tests, Detention reservoirs, Nitrates, sphorus.
ntifiers: *Dry matter removed (DMR), *Dry ter feces (DMF), Volatile solids, Feedlot slope, le densities, Soil core samples, Feedlots.

objectives of this study were to determine the ct of feedlot slope and cattle densities on: (1) quantity and quality of runoff resulting from storms and snowmelt, (2) Downward move- t of pollutants into the soil profile on unpaved lots, and, (3) Amount of solids accumulation he feedlot surface. Pairs of feedlots with 3, 6, 9% slopes were installed. Ten and twenty cattle e placed in each pair of feedlots, which allowed and 100 sq. ft. of area per animal. Volumetric surement of runoff resulting from rainfall and wmelt were made and samples of each runoff occurrence were taken to the laboratory for analysis. Laboratory analyses included pH, electric conductivity, total solids, non-volatile solids, total nitrogen, ammonium, nitrate, total phosphorus, COD and BOD. Soil cores were taken to depths of 14 ft. below the feedlot surface and adjacent buffer strips to determine downward movement of contaminants into the soil profile. Solids accumulations on the lot surface were removed twice. Weights of material removed were recorded and composite samples were taken to the laboratory for analyses. (Christenbury-Iowa State)
W71-00931

INFLUENCE OF POULTRY-MANURE-REMOVAL SCHEDULES ON VARIOUS DIPTERA LARVAE AND SELECTED ANTHROPOD PREDATORS,
California Univ., Berkeley. Dept. of Entomology and Parasitology.
John H. Peck, and John R. Anderson.
Journal of Economic Entomology, Vol 63, No 1, February 1970, p 82-90. 11 fig, 7 ref.

Descriptors: *Farm wastes, *Poultry, *Larvae, *Insect control, *Entomology, Vectors.
Identifiers: *Manure removal, *Diptera larvae, *Arthropod predators, Sampling, Control of flies.

The effects of weekly manure removal, monthly removal, and no removal on populations of fly larvae and slected predators (Acarina: Machrocheles muscaedomesticae Scopoli, Fuscuropods sp. (undescribed), Parasitidae; Coleoptera: Staphylinidae, Histeridaw, Hydrophilidae; Diptera: Ophyra leucostoma (Wiedemann) were studied for a full fly season at each of 2 northern California ranches. Third-instar larvae of the house fly, Musca domestica L., the false stable fly, Muscina stabulans (Fallen), and Calliphoridae were most abundant in 1-week-old manure; those of the little house fly, Fannia canicularis (L.), the coastal fly, Fannia femoralis Stein, and the black garbage fly, O. leucostoma, reached greatest numbers in 2- to 3-week-old manure. Unremoved manure had the least numbers of dipterous larvae, with the exception of the stable fly, Stomoxys calcitrans (L.). All predators studied were most abundant in unremoved manure. Abstention from manure removal favored the predators; monthly or biweekly removal favored the dipterous larvae. (Miner-Iowa State)
W71-00933

GROWTH RATE AS A MEASURE OF PRIMARY PRODUCTIVITY IN BENTHIC ALGAE,
Delaware Univ., Newark. Marine Lab.
Jonathan E. Taylor.
Cheasapeake Science, Vol 10, Nos 3 - 4, p 299-300, Sept.-Dec. 1969. 10 ref.

Descriptors: *Primary production, *Growth rates, Standing crop, Aquatic environment.
Identifiers: Benthic algae, Dry weight.

The rate of primary production is the amount of organic matter produced per unit time. The relation between estimates of growth rates and estimates of primary production is tenuous at best. The most accessible estimates of growth are harvest measurements of changes in the standing crop, but this depends on the destruction of the tissue. Less readily available in situ measurements are changes in linear dimension or surface area of the plant. Both techniques require independent estimates of respiration. (Upadhyaya-Vanderbilt)
W71-00972

THERMALLY INDUCED INTRACELLULAR ALTERATION OF RIBOSOMAL RIBONUCLEIC ACID,
Kansas State Univ., Manhattan.
Leonard J. Rosenthal, and John J. Iandolo.
Journal of Bacteriology, Vol 103, No 3, p 833-835, Sept 1970. 3 fig, 10 ref.

Descriptors: *Thermal pollution, Heat, Cultures, Degradation, Structure, Resistance.
Identifiers: Intracellular, Ribonucleic acid, Thermal pollution effects.

A rapid decay of ribonucleic acid (RNA) has been observed when living cells are exposed to elevated temperature 25C cultures of Staphylococcus aureus were grown and heated. Cell free extracts were prepared by suspending normal and heat treated cells in a lytic mixture. RNA was obtained from the crude extracts and whole cells by a modified phenol-dupanol method. Tritium labeled 23S RNA from heated and control cells was purified by sucrose gradient centrifugation. The control sample contained both 50 and 30S particles, whereas the heat treated preparation was essentially devoid of the 30S unit. Experiments have shown that the degradation of 30S particles varies from 85 to 100 per cent whereas the 50S particles appear intact. Polyacrylamide gel electrophoresis was used to fractionate normal and heated RNA preparations from both crude extracts and whole cells. Both molecular species of RNA were found in the extracts from untreated cells, but in the heated preparation 16S RNA was highly degraded and present only as a very small region. The extent of secondary structural differences in normal and heated 23S RNA was estimated by examining susceptibility to hydrolysis by pancreating ribonuclease. Normal 23S RNA contained 25.2 per cent resistant areas of helical configuration, whereas heated preparation was 16.6 per cent resistant. During heat shock unwinding at 23S RNA occurred. STUDIES ON LIMESTONE TREATMENT OF ACID MINE DRAINAGE, OPTIMIZATION AND DEVELOPMENT OF IMPROVED CHEMICAL TECHNIQUES FOR THE TREATMENT OF COAL MINE DRAINAGE.
Bituminous Coal Research, Inc., Monroeville, Pa.

Available from NTIS as PB-195 282, $0.95 in microfiche. Also for sale by the Superintendent of Documents, US Government Printing Office, Washington, DC 20402. Price $1.25 SOD 167.13/4 DAST 33. Water Pollution Control Research Series DAST-33, 14010EIZ, 1/70. January, 1970. 96 p, 25 tab, 29 fig, 22 ref. FWQA Program 14010 EIZ, Grant 63-01-68.

Descriptors: *Mine drainage, *Neutralization, *Limestone, Oxidation, *Coal mine water, Iron oxides, Electrophoresis, Activated carbon, Sludge, Coagulation, Waste water.

Identifiers: Ferrous iron, Magnetic sludge.

Four actual coal mine waters have been neutralized with limestone both to a batch scale and by utilizing a continuous flow apparatus. Variations in treatment procedure were necessary depending on the characteristics of the individual waters. A standardized test was established to evaluate the reactivity of the limestone. The following variables are of importance in evaluating limestones for coal mine water neutralization: (a) particle size, (b) Ca and Mg content, and (c) surface area. Ferrous iron oxidation has been accomplished with both synthetic and actual coal mine water at low pH in the presence of coal-derived activated carbon. Electrophoretic mobility studies on procipitates obtained by both lime and limestone neutralization of coal mine water yielded information which can be applied for more effective sludge removal. Magnetic sludges were prepared using two different iron-bearing waters. The conversion of precipitates to a magnetic form results in significant reductions in settled sludge volumes as well as increases in solids content, compared to the initially formed sludge obtained by lime neutralization alone. Data obtained in these studies indicate that the limestone process offers considerable promise for an improved lower cost method for treating several types of coal mine waters.

DESIGN OF CONDENSER COOLING WATER SYSTEM FOR A NUCLEAR POWER PLANT LOCATED ON A LARGE ESTUARY,
Baltimore Gas and Electric Co., Md.; Johns Hopkins Univ., Baltimore, Md. Dept. of Geography; and Worcester Polytechnic Inst., Holden, Mass. Alden Research Lab.
F. J. Jeffers, J. C. Geyer, and L. C. Neale.
Transactions of the ASME, Vol 92, Series A, No 2, April 1970, p 150-156. 5 fig, 3 tab, 8 ref.

Descriptors: *Thermal pollution, *Cooling water, *Nuclear power plant, *Estuaries condensers, Tidal waters, Aquatic life, Solar radiation, Temperature, Model studies, Maryland.
Identifiers: Water quality standards, Chesapeake Bay, Momentum jet, Calvert Cliffs.

Electric generating capacity in the U. S. is continuing to increase at an exponential rate of growth. According to the Federal Power Commission the installed capacity on January 1, 1969, of 290,000 megawatts (MW) may reach 1,000,000 MW by 1990. The sun continuously supplies radiation to the whole earth at a rate of about 174 x 10 to the 9th power MW, which is estimated to be more than 10,000 times mankind's current total rate of fuel energy consumption. The mean monthly surface heat exchange coefficient, K, of the Chesapeake Bay during summer is about 45MW sq mi/F. From this it is estimated that for a temperature rise above ambient 1.5 F over the 3,000 square miles surface of the Bay, exclusive of tributary estuaries, the heat acceptance capacity is 220,000MW of waste heat. This is 64 times the amount of waste heat to be disposed of at Calvert site. Model tests which were carried out to determine the temperature distribution in the vicinity of the plant site and to assist in designing intake and discharge structures which would minimize any local adverse effects are described. Differences in performance of jet releases and low velocity releases as well as shoreline or off shore discharges were fully evident in the test results. (Upadhyaya-Vanderbilt)

SOME SPECULATIONS ON THE DEVELOPMENT OF NON-BIOLOGICAL METHODS OF SEWAGE TREATMENT,
Water Pollution Research Lab., Stevenage (England).
G. E. Eden.
Effluent and Water Treatment Journal, Vol 10, No 3, p 138-140, 142-146, 1970. 4 tab, 9 ref.

Descriptors: *Sewage treatment, Sludge disposal, Effluents, Coagulation, Sands, Filtration, Suspended load, Solid wastes, Biological treatment, Chemical precipitation, Oxidation, Nitrification, Distillation, Coals, Reverse osmosis, Ammonia, Lime, Aeration, Sulfates, Phosphates, Bicarbonates, Sodium, Potassium, Calcium, Hydrogen ion concentration, Organic compounds.
Identifiers: *Physico-chemical sewage treatment, Borate, Permanganate value, Anionic detergent.

Developments in the field of sewage treatment, indicating a tendency to supplement or replace traditional methods with processes having a closer relation to water treatment and water-reclamation practices, are presented. Recent innovations in sludge conditioning and incineration promise improvement in sludge disposal techniques. The traditional physico-biological procedure will remain the standard method of sewage treatment for major communities but will be improved with better understanding of basic microbiology of the processes. The following methods are suggested: optimization of sewage treatment for reclamation by a combination of high-rate biological treatment with chemical coagulation; treatment of crude sewage, intended primarily to produce an effluent low in phosphorus, first with lime and recycled sludge to precipitate most of the phosphate. Advantages and disadvantages of nonbiological processes for complete treatment of sewage are given in discussion of distillation, treatment of sewage using coal, high temperature oxidation of sewage, and chemical coagulation followed by reverse osmosis. ELIMINATION OF CHLORAL FROM INDUSTRIAL EFFLUENTS BY ADSORPTION (IN RUSSIAN),
Institut Kolloidnoi Khimii i Khimii Body.
A. M. Koganovskii, and L. N. Gora.
Ukrainskii Khimicheskii Zhurnal, Vol 35, No 4, p 402-404, 1969. 1 fig, 3 tab, 3 ref.

Descriptors: *Industrial effluents, *DDT, *Waste water treatment, Separation techniques.
Identifiers: Charcoal, Chloral.

One of the introduced methods frees industrial effluents from the biologically undecomposable chloral by its adsorption by activated charcoal. Subsequently the charcoal is saturated with sodium hydroxide, a treatment which converts chloral into chloroform and sodium formate. The formate solution is biologically oxidized, whereas chloroform is extracted by water vapor. In the second method, chloral is converted to chloroform and formate by an addition of lime and alkali to the effluent. The latter is then passed through activated charcoal and the regeneration is accomplished by a stream of vapor. The effluent of the plants manufacturing DDT contains from 2 to 30 gallon/liter of chloral, the presence of which precludes biological purification. (Wilde-Wisconsin)

Identifiers: *Fishes, Industries, *Water, Sterilization, *Parasites, *Ultraviolet radiation, Pest control, Tests, USSR.

For sterilization of the water of cercariae, and also parasitic protozoans, experiments were performed in the laboratory on the effect of ultraviolet rays (UV-rays) on free-living infusoria, parasitic protozoans and non-specific cercariae. First the effect of UV-rays on Chilodonella cyprini, Trichodina sp., Paramecium caudatum, Cercaria sp. in standing water were studied; then several tests with cercariae in flowing water, utilizing the bactericidal apparatus were performed.

Identifiers: *Methane decomposition, Methane cracking, Carbon separation, Reactor design.

Experimental studies of catalysts for decomposition of methane and process design studies directed to the problems of carbon production in high-temperature reaction required for a subsystem of the Closed Sabatier system as applied to space life support. The basis for a new reactor design for continuous carbon removal in a gravity independent manner was demonstrated using a rotating magnetic field to support the catalyst in the flowing methane stream and to confine the catalyst bed within the high-temperature reaction zone until a high catalyst utilization is achieved. For this purpose, the preferred catalyst was one power which maintains magnetic properties at the desired reaction temperature of 850 C. On the basis of the experimental data obtained, a methane decomposition reactor having a catalyst volume of about 1 liter was designed for a nominal 3-man system.

ntifiers: *Floating aerator, Suspended solids,
atile solids.

earch at Purdue University indicates that a
ting aerator in a lagoon can provide a low cost
em that promises to avoid pollution dangers
saves labor. Manure is dumped into the lagoon
e each day although it is better to have it con-
ously trickle in. Extra water is added to bring
solids content down to 2% or 3% for top effi-
cy. The aerator, a big doughnut-like float with
lectric motor on top driving an impeller, runs
tinuously. The impeller forces a spray of slurry
ver the float, mixing air into the lagoon, so
obic bacteria can break down manure without
rs. Periodically a small pump pulls out some of
mixed slurry and sprinkles it through a 'big gun'
nozzle onto grassland. The irrigation lowers
lagoon, which allows more water dilution and
oves the suspended solids that won't decom-
e. Other advantages include low labor cost as
pared to pits and spreaders, and minimal
agement. Its biggest disadvantage might be
ing the manure into the lagoon each day.

ause of high solids content of dairy manure
e, anaerobic lagoons can be used satisfactorily
primary waste treatment. Average removals of
D, COD, TS, and VS above 86 percent can be
mplished with an applied loading of 70 lb
day/1000 Cu. Ft. (1120 g/day/cu. m.). An
robic lagoon can act as a sedimentation, flota-
, and anaerobic digestion process unit while
ltaneously providing long-term storage for
-degradable solid residue. The effluent from the
robic lagoon retains most of the nutrients
ent in the raw manure waste and thus has fertil-
value. The effluent has organic matter which
be oxidized. The effluent can be applied to a
or subjected to further treatment. The secon-
treatment can be an aerated lagoon, oxidation
h, or an oxidation pond. The results of the
h type aerobic treatment indicated that an ef-
nt BOD at 20 mg/l can be achieved by a 24-hr.
tion period. (Christenbury-Iowa State)

NATURAL FILTERS FOR AGRICULTURAL WASTES,
Soil Conservation Service, Washington, D.C.
W. E. Bullard, Jr.
Soil Conservation, Vol 34, No 4, November 1968, p 75-77. 2 fig.

Descriptors: *Farm wastes, *Sprinkler irrigation, *Organic wastes, *Waste water disposal, Air pollution, Water pollution, Odor, Effluents, Sewage effluents, Dilution, Decomposing organic matter, Insects, Mites, Bacteris, Fungi, Algae, Nitrites, Nitrates, Detergents, Phosphates.
Identifiers: *Biologic 'disposers', Microscopic organisms, Papermill waste effluent, Cheese factory waste waters.

Farmers and processors of farm products are finding that the waste products of their operations generally can be returned to the land with less hazard to the environment than when discharged into streams. By completing the natural cycle of growth, death, and decay on the land where crops are produced they make use of a legion of 'disposer' organisms in the soil capable of decomposing organic wastes on site. When sprayed on grass or crops, the effluent serves the dual purpose of irrigating and fertilizing the field, thus, agriculture has the potential means of disposing of its own wastes and preventing or reducing environmental pollution. Numerous examples are given of returning sewage treatment effluents, pulp and papermill effluents, and cheese factory waste waters, among others, to the land by sprinkler irrigation. The principle behind these successful operations is that of getting material produced from the land back onto the land where they can be used again in production. (White-Iowa State)

TREATMENT OF BEEF-CATTLE WASTE WATER FOR POSSIBLE REUSE,
North Dakota State Univ., Fargo.
G. L. Pratt, R. E. Harkness, R. G. Butler, J. L. Parsons, and M. L. Buchanan.
Transactions of the ASAE, Vol 12, No 4, 1969, p 471-473. 2 fig, 3 tab, 19 ref.

Descriptors: *Farm wastes, *Cattle, *Septic tank, Biochemical oxygen demand, Chemical oxygen demand, Hydrogen ion concentration, Effluents, Aeration, Dissolved oxygen, Turbidity, Aluminum.
Identifiers: *Settling tank, *Slatted floor, *Reuse, Total solids, Volatile solids, Aluminum sulfate.

Removing solid materials from wastes that have been washed from a livestock barn with water can be accomplished in several ways. In trials at the North Dakota Agricultural Experiment Station settling tanks were evaluated. Treatments of overflow from the settling tank by aeration and chemical coagulation were compared with settling only. The equipment consisted of an 8x8 foot animal shelter with a steel-slatted floor. Manure was washed from under the floor to a settling tank. A secondary treatment tank was installed to receive overflow from the settling tank. A pump end holding tank was used so that the effluent from the secondary treatment tank could be used in washing the floor under the steel slats. Aeration and treatment with alum did not upgrade the waste water sufficiently to make the water odorfree. It was also colored. Other treatment will be needed to remove the odor before the water can be suitable for reuse in washing the building. (White-Iowa State)

DEEP WELL DISPOSAL OF WASTE WATERS IN SALINE AQUIFERS OF SOUTH FLORIDA,
Black, Crow and Eidsness, Inc., Gainesville, Fla.; and Geological Survey, Tallahassee, Fla.
Jose I. Garcia-Bengochea, and Robert O. Vernon.
Water Resources Research, Vol 6, No 5, p 1464-1470, October 1970. 7 p, 4 fig, 1 tab, 5 ref.

Descriptors: *Aquifers, *Injection wells, *Florida, Waste disposal, Industrial wastes, Saline water systems, Limestones, Karst, Confined water, Groundwater movement, Regulation, Water law, Hydrogeology, Monitoring, Sampling, Brines, Acids.
Identifiers: Waste disposal wells.

Florida is underlain by very rich water-bearing strata called the Floridan aquifer. Solution channels and caverns in carbonaceous rocks are found at different depth intervals in extensive, thick (several thousand feet) sections of limestones and dolomites. In south Florida the bottom part of the Floridan aquifer includes extremely cavernous strata, commonly referred to as the 'Boulder Zone.' Chloride concentration in the water of the Boulder Zone is over 2000/mg liter. Because of this, large volumes of brine from oil fields are reinjected into this zone. Since 1966 industrial waste (essentially 1% acetic acid) has been injected into a disposal well drilled to the top of the Boulder Zone southeast of Lake Okeechobee. Planning and monitoring of this well have included the cooperation of government and private interests. Experiences, results, and potential of this zone for further similar uses are discussed. RADIOACTIVE WASTE DISPOSAL BY HYDRAULIC FRACTURING,
Oak Ridge National Lab., Tenn.
Wallace de Laguna.
Industrial Water Engineering, Vol 7, No 10, p 32-37, October 1970. 6 p, 4 fig, 9 ref.

Descriptors: *Injection wells, *Radioactive waste disposal, *Fractures (Geology), *Shales, *Grouting, Hydrogeology, Permeability, Cement grouting, Clays, Concretes, Leakage.
Identifiers: Hydraulic fracturing (Underground), Waste disposal wells, Waste injection wells.

Nuclear fuel reprocessing plants produce about 1300 to 5200 gal per day of intermediate waste. This material, and the sludges from the low-level waste treatment, are suitable candidates for disposal by hydraulic fracturing in areas where the geology is favorable for such operations. Waste disposal by hydraulic fracturing requires much the same procedure and equipment as oil-well stimulation. Once rock fracturing and flow down the injection well are established, Portland cement and clay,

and possibly other additives are mixed into the stream of water. The liquid feed is then switched to the radioactive waste, and the waste, also mixed with the proper proportion of solids, is pumped down the well until the waste tanks are empty. The liquid feed is then switched back to water until the remaining solids are all used up, and finally is pumped down the well to flush it and the slot clear of cement. The well is then shut in until the cement has set and the waste-cement-clay mixture converted into a thin layer of artificial rock embedded in depth in the shale. (Knapp-USGS)

5F. Water Treatment and Quality Alteration

THE FLOTABILITY OF CZECHOSLOVAKIAN ION-EXCHANGE RESINS (IN CZECHOSLOVAKIAN),
Kosice Univ. (Czechoslovakia). Dept. of Chemistry.
Anna Sopkova.
English summary. Chemicke Listy, Vol 63, No 5, p 596-609, 1967. 8 fig, 7 tab, 14 ref.

Descriptors: *Resins, *Ion exchange, *Flotation, *Water treatment, Water conditioning.
Identifiers: Crosslinkage, Copolymers, pK values, Katex, Anex, Thiocarbonates, Alkylsulphates, Czechoslovakia.

The flotability of Czechoslovakian exchange resins (Katex S, Katex KM, Anex S and TM, and Anex S 8D) was compared with that of the foreign products (Dowex, Ira, Permutit, Biorex, SAR, Sar, AG, and AV). The flotability of the resins was observed in hydrogen ions and hydroxide forms, in combination with chlorine and divalent copper, and in a suspension containing 50% solid particles. The results confirmed that the flotability of exchange resins depends upon their hydrophobility and the dissocication of the attached polar groups. The resins of Czechoslovakian production exhibited a fair degree of flotability, but some of them required a higher percentage of copolymers than do resins of foreign origin. (Wilde-Wisconsin)

Descriptors: *Emulsifiers, *Oil wastes, *Dispersion, Water pollution control, Sea water, Toxicity, Laboratory tests.
Identifiers: Oil spills, Hydrocarbons, Petroleum wastes.

An unidentified commercial product, composed of carbohydrates (saccharose and glucose) and phosphoric acid was tested as an emulsifier and disperser of petroleum in water. The compound has a specific gravity of 1.596. It is introduced to petroleum spills by simple mechanical dispersion, is suitable for all waters, and remains stable in pH range of 1.8-8.0. It is 62 times less toxic than the products used since the Torrey Canyon oil spill. It has slight effect on micro-communities of marine algae in application below 0.05 cubic centimeter/liter; cultured marine ecosystems showed no effects in media containing pollutant and 0.04 cubic centimeter/liter of the compound. Marine fish displayed no apparent detrimental effects after 6-hour exposure of 0.12 cubic centimeter/liter of the product. Shrimp tolerated concentrations of 0.30 cubic centimeter/liter; mussels were unable to tolerate concentrations above 0.12 cubic centimeter/liter. These concentrations exceeded requirements for dispersion and emulsification of petroleum. Laboratory mammals showed no deleterious effects. Comparison of chromatograms after 3 months at laboratory temperature indicated that petroleum disappeared almost entirely from solution. The problems of residual sludge of sea transport, beach pollution and harbor installations may be overcome by this compound. (Auen-Wisconsin)

FEASIBILITY OF A PERIODIC FLUSHING SYSTEM FOR COMBINED SEWER CLEANSING.
FMC Corp., Santa Clara, Calif. Central Engineering Labs.

Available from the NTIS as PB-195 223, $3.00 in paper copy, $0.95 in microfiche. Final Report - Phase I, CE45363, August, 1967. 48 p, 1 tab, 11 fig, 23 ref, 4 drawings. FWQA Program 11020DJ NO08/67.

Descriptors: Sewers, Overflow, Conveyance structures, Storm drains, Water pollution control, Costs, Flow.
Identifiers: *Combined sewers, *Storm water overflow, *Flushing systems, *Sewer flushing, Sewer cleansing.

One of the causes of pollution from stormwater overflow of combined sewers is the deposition of pollutional solids during dry weather flow followed by pick up of the pollutional material during storm flow when the flow be bypassed. As a solution to this problem, it has been proposed that a flushing system be used to periodically cleanse the sewer during dry weather and convey the solids to the treatment plant. Under Phase I a study was made of sewer flushing practices, application requirements and hydraulic theory. Investigation was also made of sampling methods and equipment; flushing test equipment was designed for use in Phase II, and the cost of Phase II was estimated. It was confirmed that additional detailed information is needed to apply a periodic flushing system to actual combined sewers. It was also concluded that the existing information on sewer flushing indicated a good possibility that a periodic flushing system would be feasible for reducing pollution from combined sewer stormwater overflow. The detailed information needed to apply a sewer flushing system must be determined by a large number of controlled experiments of flushing effectiveness. The design of flushing evaluation equipment for use in Phase II has been carried to the point that cost estimates can be made for construction of the equipment. A description of the design and the cost estimates are included in this report.

Descriptors: *Lakes, *Mixing, *Water qu *Stratification, Reservoirs, Thermal profile Density stratification, Water temperature.
Identifiers: *Destratification, Interfacial ent ment.

estratification of a two-layer reservoir by pumpg fluid from one layer and jetting the discharge to the other was studied in the laboratory. The uid layers were formed by hotwater - coldwater d saltwater - freshwater combinations. For a parcular range of Richardson no., thermally stratified uids mixed more readily than those formed by line solutions indicating a greater interfacial enainment rate. Although these differences may be fluenced by molecular diffusivity as suggested by urner, it is felt that there is at least one alternate planation involving local viscous effects near the terface. The results of the study show agreement ith previous laboratory investigations involving fferent geometric arrangements, and with two eld studies of mixing in thermally stratified lakes. sufficient field evidence exists for establishing recise model-prototype relationships, but the verwhelming dominance of the Richardson no. r densiometric Froude no.) as a dynamic control evident. CANALS OFFER VAST COOLING POTENTIAL.

Environmental Science and Technology, Vol 4, No 4, April 1970.

Descriptors: Thermal pollution, Cooling water, Temperature, Evaporation, Recreation, Thermal capacity.
Identifiers: Cooling canals, Heat sink.

The principal objective of the canal lake system is provision of an extended heat sink away from the public water courses, capable of supporting power stations all along its route, with reuse of the water as many times as practical. Many of the locations in the U. S. have the potential for such development. To illustrate the potential of canal lake cooling systems, researchers have applied the concept to one of the routes suggested for a major diversion project in the northwest. This proposed 990 mile diversion would begin in Oregon, pass through northwestern California and Nevada via a series of natural lakes and man-made canals, and eventually discharge into Lake Mead. The thermal capacity of this system could support up to 30,000 Mw of generating capacity. Restraints on the system are the following: No temperature rise greater than 5C and surface temperature no higher than 32C at any point. System would also provide recreational facilities to water short areas without distracting from the basic purpose of the system. (Upadhyaya-Vanderbilt)

SYSTEMS APPROACH TO THE EVALUATION OF BENEFITS FROM IMPROVED GREAT LAKES WATER QUALITY,
Illinois Univ., Urbana. Dept. of Civil Engineering.
D. D. Meredith, and B. B. Ewing.
Proc 12th Conf Great Lakes Res, Internat Assoc Great Lakes Res, Braun-Brunfield, Inc, Ann Arbor, Mich, p 843-870, 1969. 28 p, 8 fig, 2 append, 29 ref.

Descriptors: *Systems analysis, *Benefit-cost analysis, *Water quality control, *Mathematical models, *Great Lakes, *Evaluation, Pollution abatement.

A systems approach to the evaluation of benefits that would accrue due to an improvement in the water quality of the Great Lakes due to pollution abatement practices was outlined. Data pertaining to the problem was gathered and a review of literature on water resources benefit evaluation was made. The basic approach for analysis of municipal and industrial water supply, recreational use, and commercial fishing involved following a change in water quality through a sequence of interrelationships to arrive at an estimate of annual benefits. The five steps to a systems analysis approach were given and a mathematical model which could be solved to determine the benefits for a change in water quality when the level of water quality before and after improvement is known was presented in the appendix. This conceptual model for benefit-cost analysis divided a lake into a number of sectors in which strong water quality interrelationships existed and water quality was influenced more by what occurred in the sector than by neighboring sectors. Sectors were defined by major water uses and water quality variables were listed. The model was said to be applicable to all uses. (Kriss-Cornell)

Union County, like most of the more densely developed and populated counties in northeast New Jersey, has been provided with large, comprehensive regional collection and treatment systems. These regional facilities were created in the past by the municipalities who had the foresight and who were endeavoring to seek the most efficient, effective and economical method of collection treatment. A brief history of the development of sanitary sewer facilities in the County will illustrate how regionalization occurred.

Available from NTIS as AD-706 216, $3.00 in paper copy, $0.95 in michrofiche. May 1957. 19 p, plates, illus, tabs. Miscellaneous Paper No. 2-222.
Identifiers: *Power plants (Establishments), Water pollution, *Water pollution, Hydraulic models, Floods, Wastes (Industrial), Scattering, River currents, Tides, Rivers, Delaware. Delaware River.

Deepwater Point and Carneys Point Plants of the du Pont Company, located on the New Jersey shore of the Delaware River are presently discharging high-acidity, high-density by-products from two retention basins through tide-controlled sluice gates into the Delaware River. The sluice gates open during times of ebbing currents and close during times of flooding currents. Currents adjacent to the shore line in the vicinity of the discharge points are low, and the plant effluents are not being rapidly and efficiently dispersed throughout the river water passing the plants. Effluent concentrations in all small embayments and pockets along the New Jersey shore are at time higher in the vicinity of the plants than elsewhere along the shore line. To alleviate this situation it was proposed that the present method of releasing effluent intermittently through the two tidal sluice gates be changed to a continuous release method utilizing pipes extending into the river along the channel bottom.

HUMAN WASTE SANITATION STUDIES,
Truesdail Labs., Inc., Los Angeles, Calif.
Clyde L. Blohm.
Available from NTIS as AD-706 931, $3.00 in paper copy, $0.95 in microfiche. Final Report, May 1965. 44 p. OCD-DS-63-235.
Identifiers: *Fallout shelters, *Wastes (Sanitary Engineering), Odors, Control, Sodium compounds, Sulfates, Copper compounds, Oleic acids, Mineral oils, Chemicals, Costs, *Odor control, Copper sulfates, Sodium bisulfate.

Investigations were made of the handling and storage of human wastes as they might be encountered under occupancy conditions in Office of Civil Defense fallout shelters. A chemical sanitizing and odor control agent has been selected from a number tested. This preferred agent is a simple physical mixture of two parts sodium bisulfate and one part copper sulfate pentahydrate, used in the waste container at the concentration of one pound per ten gallons (12,000 ppm) of accumulated wastes. One pint of oleic acid (commercial red oil) may or may not be used as a vapor barrier to improve odor control. General criteria have been established for the specification of such control agents which may be other than the one selected. Design studies were conducted for the fabrication of a Sanitary Vault intended for use in fallout shelters. The vault is equipped with two seats and has a useable fill volume of 70 gallons of mixed wastes. Four prototype units were constructed for testing. Recommendations for further work have been made.

MANAGING THE NATURAL ENVIRONMENT: A REGIONAL PLAN FOR WATER, SEWAGE, AIR AND REFUSE,
Tri-State Transportation Commission, New York.
Richard S. DeTurk.
Available from NTIS as PB-190 290, $3.00 in paper copy, $0.95 in microfiche. March 1970. 38 p. HUD Project INT P-221.
Identifiers: *Water pollution, Control, *Air pollution, Environment, Sewage, Wastes (Sanitary Engineering), Wastes (Industrial), Water supplies, Passenger vehicles, Generators, Heaters, Incinerators, Connecticut, Sea water, Purification, Desalination, Costs, Urban areas, New Jersey, New York, Sources.

The Tri-State Region Connecticut, New Jersey, New York, should invest $9.7 billion between now and 1985 to contend with its environmental problems: lack of water, dirty air, polluted streams and overflowing garbage dumps. For more water the Region should tap more sources in the countryside and make better connections between neighboring water-supply systems. For cleaner waterways, vast spending for sewage-treatment plants is required to treat industrial and residential wastes. This will require federal assistance beyond what has been offered in the past. For cleaner air, the Region needs further tightening of pollution controls to counteract increasing numbers of polluters: motor vehicles, home heating units, generating stations and incinerators. And refuse disposal requires a changeover from dumping and burying to high-grade incineration. A network of 70 to 80 incinerators should be planned and built. Other methods for gathering water, such as desalinating sea water, purifying and reusing sewer water, and damming Long Island Sound or the Hudson River, are not appropriate at this time. Also, the Region cannot count on the appearance of electrically powered autos to stem air pollution, nor can enough remote areas be found to accept massive amounts of hauled garbage from developed areas. But tests should be encouraged to develop advanced technology, such as compacting and hauling refuse to remote areas or recycling sewage effluent or finding new uses for many solid wastes.

ENVIRONMENTAL SIMULATION AS A TOOL IN A MARINE WASTE DISPOSAL STUDY OF JAMAICA BAY,
Rand Corp., Santa Monica, Calif.
J. J. Leendertse.
Available from NTIS as AD-703 388, $3.00 in paper copy, $0.95 in microfiche. March 1970. 9 p. P-4163.
Identifiers: *Water pollution, *Estuaries, *Wastes (Sanitary engineering), Simulation, Mathematical models, New York, Fluid flow, Predictions, Transport properties, Models (Simulations), Temperature, *Waste water, Jamaica Bay (New York).

The study of technical solutions to the problem of managing fluid waste discharges in an estuary involves complicated relationships, such as those between the waste load, the location of discharges, the degree of treatment, the geometry of the estuary, the flow in the estuary, and the temperature. Models can be built to predict the probable consequences of each of the alternative solutions chosen. Using the predictions obtained from these models and whatever other information or insight is relevant, alternatives can be compared and conclusions drawn concerning the most desirable course of action. Such a model for well-mixed estuaries and coastal seas is presented and described.
W71-00830

WATER AND SEWERAGE STUDY - FIRST PHASE.
Morris County Planning Board, Morristown, N.J.

Available from NTIS as PB-192 790, $3.00 in paper copy, $0.95 in microfiche. May 1969, 89 p, plates, tabs. HUD P-97.
Identifiers: *Water supplies, New Jersey, *Sanitary engineering, *Sewage, Disposal, Statistical analysis, Rivers, Population, Consumption, Water pollution, *Regional planning and development, *Morris County (New Jersey), *Sewers, Waste water, Waste treatment plants.

The study includes an inventory of existing water and sewerage facilities within Morris County. Analysis of present water consumption and projected population indicates the need for developing additional water supplies on a long-term basis. Future demands of the individual municipalities will exceed the capacity which in many instances can be developed on an individual basis. The low-flow conditions in the streams and the volume of waste water from individual sewage treatment plants, particularly in the Passaic watershed, indicates the need for improved treatment methods in order to meet the stream quality criteria recently established by the New Jersey State Department of Health. Although the average flows in the streams of the County are sufficient to provide adequate dilution for the present volume of waste water discharged, there are times during the summer and fall months when dilution ratios of less than 1 to 1 are available for assimilating the pollutants discharged by the many waste treatment plants located on a stream. A review of available data on the water quality of the stream indicates that the mineral characteristics are such that the waters are suitable as a source of raw water supply with the required degree of treatment dependent upon flow conditions at specific times. Particularly as regards the Passaic watershed, high coliform count and low dissolved oxygen at times preclude the safe use of the majority of the streams for water contact sports such as swimming or the propogation of game fish.
W71-00831

WATER POLLUTION CONTROL CREATES DEMAND FOR GROUNDWATER HYDROLOGISTS,
Geological Survey, Denver, Colo. Water Resources Div.
E. A. Moulder.
Mining Engineering, p 90-91, February 1970. 2 p, 1 fig.

Descriptors: *Water pollution control, *Groundwater, *Water supply, Water pollution sources, Industrial wastes, Mine wastes, Acids, Dewatering, Desalination, Leaching, Chemical analysis, Analytical techniques.
Identifiers: *Groundwater hydrology.

The mining industry is continually faced with problems involving dewatering, pollution, water supply, leaching and hydrochemical mining and prospecting. Greater application of the principles of groundwater hydrology to solution of these problems promises improved operating efficiency, increased safety and better public relations. Estimating the magnitude of dewatering for a proposed

nine may be a major factor in determining the easibility of proceeding with mine development. Diverting the source of groundwater to an aban-doned mine may save costly treatment of acid nine-drainage. Development of a large ground-vater supply near an ore deposit may enhance the ossibilities of a leaching operation. Detection of ertain dissolved minerals in water from springs or vells may lead to hitherto unknown mineral leposits. Current efforts of industry, educational nstitutions and government are making these kind f events more commonplace. (Woodard-USGS)

ROTARY VIBRATORY FINE SCREENING OF COMBINED SEWER OVERFLOWS,
Cornell, Howland, Hayes and Merryfield, Corvallis, Oreg.
Donald M. Marske.
For sale by the Superintendent of Documents, U S Government Printing Office, Washington, D C, 20402 - $2.50. In: Combined Sewer Overflow Abatement Technology, Water Pollution Control Research Series 11024 - 06/70, p 57-106, June 1970. 50 p, 13 fig, 6 tab, 2 ref.FWQA Contract 14-12-128.

Descriptors: *Storm runoff, *Storm drains, *Sewers, *Overflow, *Water pollution, Chemical analysis, Research, Screens, Model studies, Water pollution control.
Identifiers: *Combined sewer overflows, *Portland (Oreg).

The objective of this study was to determine the feasibility, effectiveness, and economics of employing high-rate, fine-mesh screening for primary treatment of storm water overflow from combined sewer systems. The final form of the screening unit stands 63 inches high and has an outside diameter of 80 inches. The unit is fed by an 8-inch pipe carrying 1700 gpm (122 gal/min/sq ft) which is distributed to a 60-inch diameter rotating (60rpm) stainless steel collar screen having 14 square feet of available screen area and a 165 mesh (105 micron opening, 47.1 percent open area). The screen is backwashed at the rate of 0.235 gallons of backwash water per 1000 gallons of applied sewage. Based on final performance tests run on dry-weather sewage, the unit is capable of 99 percent removal of floatable and settleable solids, 34 percent removal of total suspended solids and 27 percent removal of COD. The screened effluent is typically 92 percent of the influent flow. (See also W70-09558) (Woodard-USGS)
W71-00872

SEWER MONITORING AND REMOTE CONTROL-DETROIT.
Detroit Metro Water Services, Mich.

For sale by the Superintendent of Documents, U S Government Printing Office, Wash, D C 20402 - Price $2.50. In: Combined Sewer Overflow Abatement Technology, Water Pollution Control Research Series 11024 - 06/70, p 219-290, June 1970. 72 p, 33 fig, 4 tab, append. FWQA Project 11020 FAX.

Descriptors: *Storm drains, *Sewers, *Overflow, *Water pollution control, Water quality, Monitoring, Remote control, Rain gages, Systems analysis.
Identifiers: *Combined sewer overflows, Storm flow anticipation, First flush interception, Selective retentions, Selective overflowing, Detroit (Mich).

Detroit is faced with the problem of preventing pollution of the Detroit and Rouge Rivers from its combined sewer system overflows. As an alternative to undertaking a dubiously effective sewer separation program, estimated to cost in excess of two billion dollars, the Detroit Metro Water Department has installed the nucleus of a sewer monitoring and remote control 'system' for controlling the pollution from the combined overflow from many small storms at a cost of slightly over two million dollars. The 'system' includes telemetering rain gages, sewer level sensors, overflow detectors, a centrally located computer and data-logger, and a centrally located operating console for controlling pumping stations and selected regulating gates. Installation has been virtually completed and now enables applying such pollution control techniques as 'storm flow anticipation', 'first flush interception', 'selective retention', and 'selective overflowing'. An evaluation of the effectiveness of this initial installation will serve as the basis for determining what additional pollution control facilities are required. (See also W70-09558) (Woodard-USGS)
W71-00876

ORGANIZING FOR SOIL EROSION AND SEDIMENT CONTROL IN OUR NATIONS URBAN AREAS,
National Association of Counties Research Foundation, Washington, D.C.
Mel D. Powell.
For sale by the Superintendent of Documents, U S Government Printing Office, Washington, D C 20402 - Price $2.50. In: Combined Sewer Overflow Abatement Technology, Water Pollution Control Research Series 11024 - 06/70, p 321-336, June 1970. 16 p. FWQA Program 15030 DTL.

Descriptors: *Sediment control, *Erosion control, Urbanization, Road construction, Sewers, Storm drains, Overflow, Storm runoff, Planning, Abatement, Control systems.
Identifiers: *Guide book, *Policy making, Organization for control.

Some considerations involved in organizing an erosion and sediment control program along with some specific organizational structures that may be suitable, with modifications, to a variety of local situations are discussed. The Federal Water Quality Administration awarded the National Association of Counties Research Foundation a grant to investigate the problem of sedimentation and to develop a guidebook for local policy making officials. Chapter 10 entitled 'Action Guide for Erosion and Sediment Control' from the guidebook published in March 1970 is included in this report. The chapter represents a synthesis of sedimentation control concepts, principles, and techniques, which can be converted into general action plans by local, state, and federal levels of government. APPROXIMATE HYDRAULIC MODELLING OF STRATIFIED FLOWS IN COOLING PONDS,
A. G. Averkiev, K. Ya. Kind, and I. I. Makarov.
13th Congress of the International Association for Hydraulic Research, August 31-September 5, 1969, Broc. Vol I, Subject A, p 99-103.

Descriptors: Stratified flow, Hydraulic models, *Thermal powerplants, Froude number, Temperature, *Heat balance.
Identifiers: *Cooling Ponds.

An approximate method of modelling and designing the cooling capacity of ponds for thermal power plants taking into account the occurrence of stratified flows in the cooling pond is given. The method is based on experimental findings obtained on large scale hydrothermal models, on field investigation and on scaling of hydrothermal research data to prototype conditions using digital computers. It is shown that heat loss to the atmosphere of thermal jets will be less by two orders of magnitude than the lateral heat transfer. Equations are derived for the case when the warm jet entering a cold reservoir spreads in it causing a two layer motion, the density of each layer being assumed constant across the depth. The heat balance equations for the entire reservoir is solved to define the intake water temperature. The intake cool water temperature for a number of cooling ponds of actual thermal plants was determined by the contours of prototype isotherms and the relations adopted for calculation of heat loss coefficient. Calculation results are in satisfactory agreement with corresponding observed values of the cool water temperature. (Upadhyaya-Vanderbilt)

SWINE HOUSING AND WASTE MANAGEMENT - A RESEARCH REVIEW,
National Pork Producers Council; Illinois Univ., Urbana. Coll. of Agriculture.
Arthur J. Muehling.
Department of Agricultural Engineering, College of Agriculture, University of Illinois at Urbana-Champaign, August 1969. 91 p, 232 ref. A. Eng.-873.

Descriptors: *Farm wastes, *Hogs, *Confinement pens, *Aerobic treatment, *Anerobic digestion, Odor, Economics.
Identifiers: *Oxidation ditch, *Housing, Space requirements, Slotted floors, Methods of disposal, Legal implications.

Current and past research in swine housing and waste management is reviewed and summarized. The author utilized 77 references in Part I of the report on swine housing studies. Research on production units, space requirements, slotted floors, and economics of swine housing systems is presented in summary form. Recommendations for future swine housing research are made. 155 references were utilized in Part II of the report on waste management studies. Properties of swine wastes, treatment and return of swine wastes to the land, other methods of disposal, gases and odors, and legal implications of waste handling are summarized. Recommendations for future research in waste management are made. Six fact sheets available from the National Pork Producers Council, Des Moines, supplement the research review. (White-Iowa State)

CONTROL OF HOUSE FLIES IN SWINE-FINISHING UNITS BY IMPROVED METHODS OF WASTE DISPOSAL,
Purdue Univ., Lafayette, Ind. Dept. of Entomology.
R. C. Dobson, and F. W. Kutz.
Journal of Economic Entomology, Vol 63, No 1, February 1970. 6 fig, 3 ref.

Descriptors: *Farm wastes, *Hogs, Disposal, Lagoons, *Insect control, Vectors, Entomology.
Identifiers: *Control of house flies, *Waste disposal systems, Collection pit, Slotted floor.

Four swine-finishing units were equipped with different waste disposal systems to determine their effectiveness in preventing development of the house fly, Musca domestica L. Each unit was completely screened to prevent contamination from outside sources. No insecticides were used. One of the 4 was a standard shed-type house used as a control. The other 3 units were equipped with new and improved waste disposal systems. Results from 2 years of study indicate that house fly production in and around swine-finishing units can be greatly reduced by using 1 of the 3 improved methods of waste disposal described. (Miner-Iowa State)

INFLUENCE OF SPACE ON PERFORMANCE OF FEEDLOT CATTLE,
California Univ., Davis; and Agricultural Research Service, Davis, Calif.
S. R. Morrison, V. E. Mendel, and T. E. Bond.
Transactions of the ASAE, Vol 13, No 1, January 1970, p 145-147. 2 fig, 2 tab, 9 ref.

Descriptors: *Farm wastes, *Cattle, *Performance, *Confinement pens.
Identifiers: *Space, *Influence, *Weight gain, Feed efficiency.

Two tests in the Imperial Valley of California involving 74 heifers indicate that space allotments below 40 sq. ft. per head are likely to reduce the body weight gains and feed efficiency of feedlot cattle, and hot weather may accentuate the decrease. There is evidence suggesting that animal performance may be less even at 40 sq. ft. than at 60 sq. ft. per head. Tests with larger pens and more animals are desirable to establish the relation between gain and feed efficiency and pen space per animal. The range of space tested should be great enough to provide sufficient data to aid in designing feed lots for maximum profit. (White-Iowa State)

WATER POLLUTION CONTROL LEGISLATION,
Cornell Univ., Ithaca, N.Y.
Raymond C. Loehr.
Condensation of report NA68-304 available from ASRE, St. Joseph, Mich. 49085, $0.50. Agricultural Engineering, Vol 50, August 1969, p 468-470. 8 ref.

Descriptors: *Farm wastes, *Water pollution, *Legislation, Water pollution control, Water Quality Act, Biochemical oxygen demand, Phosphates, Effluents.
Identifiers: *Treatment processes, Aerobic oxidation pond, Aerated lagoon, Oxidation ditch, Minimum removal efficiencies, Water quality criteria.

Agricultural production facilities must consider waste disposal as an important aspect of their operations. Waste treatment and disposal facilities are becoming important parts of agricultural production facilities. They must be evaluated whenever expansion or establishment of new facilities is underway. Highly efficient secondary treatment processes perhaps including nutrient removal and disinfection may be necessary for discharging waste waters to surface waters. The need for and cost of these processes should cause a re-evaluation of the comparative costs of handling, treatment, and disposal of agricultural wastes as a solid. Land disposal is another alternative. When agricultural wastes are handled to avoid polluting surface waters, other types of pollution must be avoided. Mere transferral of pollution from one sphere to another will no longer be tolerated. These are among the aspects which this paper deals with. (White-Iowa State)
W71-00935

CATTLE FEEDERS AVOID POLLUTION BY USING WASTES IN IRRIGATION.
Soil Conservation Service, Washington, D.C.

Soil Conservation, Vol 34, No 4, November 1968, p 84-86. 3 fig.

Descriptors: *Farm wastes, *Cattle, *Ponds, *Furrow irrigation, Lagoon, Water pollution, Nebraska, Water Quality Act, Costs, Loess.
Identifiers: *Tractor driven pump, Soil Conservation Service, Feedlots.

Two brothers in Franklin county Nebraska have implemented a system that avoids pollution while fertilizing and irrigating their land. Solid wastes are hauled to the field from their 5 feedlots covering four acres. The rest washes down with every rain and is caught in a farm pond in a natural draw. In the bottom of the pond a lagoon-type pit was dug so there will always be some water available to keep wastes in suspension. From here the suspension is pumped to nearby fields by a tractor driven pump. If it doesn't rain they pump water from their irrigation wall into the pond and out again onto the land. (White-Iowa State)

IRRIGATING WITH ANIMAL WASTE,
Soil Conservation Service, Hermiston, Oreg.
Clarence Underwood.
Soil Conservation, Vol 34, No 4, November 1968, p 81-82. 3 fig.

Descriptors: *Farm wastes, *Hogs, *Irrigation, *Sewage disposal, Effluent, Soil conservation, Odor, Fertilization, Lagoons, Sprinkler irrigation, Nitrogen, Waste dilution, Water pollution.
Identifiers: *Soil Conservation Service, Velocity-controlled water outlets, Holding basin.

Two brothers purchased a civilian housing facility from the Umatilla Army Depot and converted the 57 units to hog production. Wastes from the 22,000 hog per year facility are flushed into a gutter, through a sewer system and into the first of two lagoons. A second holding basin allows additional settlement and dilution of solids. From here it is pumped to irrigate about 500 acres of land. The brothers estimate that their system puts about 5 pounds of nitrogen per acre on a field each time it is irrigated. The crops are fertilized, little odor is noticeable, and no water pollution has been detected. (White-Iowa State)

6A. Techniques of Planning

URBAN WATER POLICIES IN THE DETROIT METROPOLITAN REGION,
Michigan Univ., Ann Arbor. Office of Research Administration.
George M. Walker, Jr., and Norman Wengert.
Available from NTIS as PB-195 313, $3.00 in paper copy, $0.95 in microfiche. Final Report, July 1970. 271 p, 4 map, 8 tab, 1 chart, 166 ref, 10 append. ORA Project 01351. OWRR Project C-1142 (No. 1589).

Descriptors: *Water policy, *Decision-making, Interagency co-operation, Political aspects, Urbanization, City-planning, Municipal water, Administrative decisions, Water districts, Treatment facilities.

Identifiers: *Metropolitan areas, Public policy, Water resource planning, Political equity, Comprehensive planning, Water supply systems.

The report deals with the period after 1959 when the Detroit Water Board took action to become the water supply agency for the entire metropolitan area. The most critical issues of regional water service lie in the area of inter-governmental relations because of the Board's necessity of selling water at wholesale prices to suburban governments. Basic propositions concerning the Detroit situation are: (1) For efficiency in distribution costs and equity for consumers a unified water supply system is best; (2) Physical water supply is not a problem in the Detroit region; (3) Engineering problems of supplying water are minimal because of level terrain; (4) Major problems are political and institutional; (5) Economic problems are not overwhelming; (6) Water policy decisions are dispersed throughout the system; (7) Decisions affecting water policy may be influenced by other problems of dispersed power in the metropolitan area. (Wray-Chicago)

COMPUTERS IN THE RESEARCH AND TEACHING OF HYDROLOGY,
Environmental Dynamics, Inc., Los Angeles, Calif.
Venkateswararao Vemuri.
Progress of Hydrology, Vol 1, p 290-315, July 1969. 26 p, 1 fig, 9 ref.

Descriptors: *Hydrology, *Systems analysis, *Analog computers, *Digital computers, Simulation analysis, Monte Carlo Method.
Identifiers: Hybrid computers, Signal processing, DSCT, CSDT, DSDT.

This paper systematically explored trends of research in simulation and signal processing as they apply to hydrology and how modern computational tools shape the course of events and thinking at educational and research institutes attempting to solve these problems. It was said that hydrology can be divided into two classes: (1) the scientific or technological aspects of the problem and (2) the management or behavioral aspects of the problem. A narrative description of hydrological systems was given. Two distinct formats in problem specification, direct and inverse, were presented in detail. Computational demands in hydrological systems analysis included signal processing problems and simulation problems. The conventional computational tools, which serve the needs of simulation, mentioned were analog computers, digital computers and passive network analogs. The hybrid computer which attempts to take advantage of the attractive features of both analog and digital computers was described. A comparison of the discrete-space and continuous-time (DSCT) technique and the continuous space, discrete-time (CSDT) method as a means of solving a problem numerically was given. A third method of solving was the discrete-space, discrete time (DSDT) method which has been used to identify the transmissibility storage coefficient and boundary of an aquifer. An alternate method mentioned was the Monte Carlo method. (Kriss-Cornell)

FUNCTIONAL EVALUATION OF A WATER RESOURCES SYSTEM,
Corps of Engineers, Sacramento, Calif. Hydrologic Engineering Center.
Leo R. Beard.
Tech Paper No 4, The Hydrologic Engineering Center, Corps of Engineers, US Army, Jan 1967. 18 p, 2 fig, 6 tab.

Descriptors: *Computer programs, *Systems analysis, *Hydrologic aspects, *Water resources development, *Reservoir operation, *Simulation analysis, Conservation, Optimization, Costs.
Identifiers: Willamette River Basin, Susquehanna River Basin.

A generalized computer program for evaluating the conservation accomplishments of an extremely complex water resources system developed in the Hydrologic Engineering Center of the Corps of Engineers, US Army was described. The program, 'Reservoir Systems Analysis-Conservation', has been used in preliminary studies to evaluate the functional (hydrologic) accomplishments of large water resource systems in the Susquehanna and Willamette River Basins and of several smaller systems. This elaborate computer program simulated the operation of a water resources system for many conservation functions such as water supply, power generation and low-flood regulation, recognizing the important constraints imposed by flood control requirements. It simulated the operation usually on a month-by-month basis with provision for operation by any regular or irregular intervals. The manner in which the water resources system was described to the computer was illustrated by use of an example for the Willamette River Basin study which considered 27 control points, 13 diversions and 14 reservoirs with 5 power plants. The program was designed for simplicity of use and costs per operation study with a high-speed computer are nominal. (Kriss-Cornell)

HYDROSTATISTICS - PRINCIPLES OF APPLICATION,
Corps of Engineers, Sacramento, Calif. Hydrologic Engineering Center.
Leo R. Beard.
Tech Paper No 15, The Hydrologic Engineering Center, US Army Corps of Engineers, July 1969. 11 p, 41 ref.

Descriptors: *Hydrologic properties, *Statistical methods, *Decision making, *Design criteria, *Probability, Time.
Identifiers: *Hydrostatistics.

The purpose of this paper was to discuss briefly and very generally the nature of hydrologic engineering problems that could be solved through application of statistics and to examine the basic concepts involved in the application of statistics to such problems. The importance of applying statistics to a complete decision process, rather than to an incompletely separable link of that process, was emphasized. Hydro-statistics which have historically been concerned primarily with the determination of the probability or frequency of events and the correlation or interrelation among events, were discussed. It was said that in most cases of hydrologic design, it is traditional to select a design criterion that expresses the adequacy in terms of probability of exceedence. An example of a water supply reservoir that might be designed for a drought that would be exceeded once in 25 years was given. Discussions were based upon the objective of determining expectation over a long period of operation of a specific project design, rather than evaluation of the probability of hydrologic events independent of any design. These included probability of a single event, indirect probability determinations, coincident probability determinations and complex probability problems. Has 41 references. (Kriss-Cornell)

OPTIMUM GAGING STATION LOCATION,
Geological Survey, Washington, D C.
Nicholas C. Matalas.
Progress of Hydrology, Vol 1, p 473-489, July 1969. 17 p, 6 ref.

Descriptors: *Optimization, *Regression analysis, *Regional analysis, *Flow characteristics, *Gaging stations, Budgeting, Cost.

For an existing network of stations, two approaches were presented for determining an optimal scheme of gaging. Both approaches utilized the correlation between flow sequence to establish a regression relation, whereby, the flow properties of a discontinued station may be inferred from the properties of stations that are not discounted. The first approach sought to identify those stations that were to be discontinued, such that the sum of the variances of the estimates of a flow property at all stations was a minimum subject to a budgetary constraint. Minimizing the sum variances was equivalent to maximizing the total information content. The second approach considered the networks of stations for several regions and sought to identify those stations within the region that may be discontinued, such that the unit cost of information was the same for all regions. This approach was combined with a regional analysis of the information at the stations in an existing network to provide a basis for selecting among many ungaged sites those that are to be gaged. A regression analysis that relates a flow property at each station to a physiograph and metorologic characteristics associated with each station was used. The approaches for both gaged and ungaged sites were illustrated in terms of only one flow property-the mean for a sequence of flow observations. The approaches were quite general and could be applied to many flow properties. (Kriss-Cornell)

MATHEMATICAL METHODOLOGY IN HYDROLOGY,
Arizona Univ., Tucson. Hydrology and Water Resources.
Chester C. Kisiel.
Progress of Hydrology, Vol I, p 362-399, July 1969. 38 p, 3 fig, 1 tab, 71 ref.

Descriptors: *Mathematical modeling, *Hydrology, *Probability, *Systems analysis, *Research and development, *History.
Identifiers: Hydrologic problems.

The purpose of the paper was: (a) to review the current state of the art, both in practice and research, in the use of mathematical methods in hydrology, and (b) to suggest directions for more efficient integration of mathematics into hydrologic education and research. Two dichotomous views in hydrology as contrasted with the philosophy of modern science were identified. The dichotomies were: (a) between the empirical and scientific approaches, and (b) between the deterministic and probabilistic approaches to modeling. In addition, discrete models used in hydrology were contrasted with continuum models. Two types of problems associated with hydrologic systems were described as either direct (forward) or inverse. Direct problems were said to be in the classical tradition and the system was known prior to characterization in terms of a mathematical equation. Classes of inverse problems mentioned include: control, identification, and estimation. Complete summaries of these and other problems were given and included error analysis and problem solving. Current teaching and research in the field of hydrology received comment. Has 71 references. (Kriss-Cornell)

THE ROLE AND DEVELOPMENT OF THE PROGRAMMING LANGUAGE 'HYDRO' IN HYDROLOGY,
Carnegie-Mellon Univ., Pittsburgh, Pa.
George Bugliarello.
Progress of Hydrology, Vol I, p 233-264, July 1969. 32 p, 13 fig, 16 ref.

Descriptors: *Hydrology, *Computer programs, *Programming languages, *History, *Design criteria, *Operations, *Analytical techniques, Water resources development, Engineering.

Summarized were the programming needs in hydrology to which HYDRO, a flexible computer language for water resource engineering, was intended to respond a review of the history, the specifications and design criteria of HYDRO, and a description of the operation of different components of HYDRO systems were presented. The organizations performing broad hydrological work were classified into six categories, according to size of the hydrologic cycle segment with which they are usually most concerned, and also according to their degree of specialization. Three pivotal programming needs in hydrology were considered. The HYDRO system dates back to 1961 and a complete history including design philosophy and specification was given. The five main areas included in the HYDRO library procedures of direct relevance to hydrology, were: frequency analysis, precipitation analysis, hydrograph analysis, open-channel hydraulics, and flood routing. The HYDRO syntax for hydrograph analysis was shown. The writing and operation of HYDRO programs was explained and examples were given. Described were the combination of the features of HYDRO and the universal algebraic computer language ALGOL into a single language HYDRALGOL and other extensions, was said to be an effective tool in the solution of selected problems and in accelerating the training of personnel in the area of hydrologic analyses. MATHEMATICAL MODELING IN HYDROLOGY,
Geological Survey, Menlo Park, Calif.
D. R. Dawdy.
Progress of Hydrology, Vol I, p 346-361, July 1969. 16 p, 91 ref.

Descriptors: *Mathematical models, *Optimization, *Hydrology, *Stochastic processes, *Simulation analysis, *Systems analysis.

This paper described the areas of interest of the working groups under the Committee on Mathematical Models in Hydrology established by the International Association of Scientific Hydrology in October 1967. The three named working groups were: Parametric Hydrology, Stochastic Hydrology and Water Resources Systems and stressed the applications of particular mathematical tools rather than stressing the discipline in which a particular problem occurs. First the purpose of simulation models and types of simulation models were given. Parametric modeling of surface runoff was then shown to be divided into component modeling and integrated system modeling. A section on stochastic modeling gave methods of stochastic simulation and their uses. Mathematical programming, use of stochastic models in systems analysis and other systems analysis techniques were described as part of mathematical modeling of water resources systems based upon the optimization of some goal, subject to constraints imposed upon the system. DETERMINISTIC NONLINEAR HYDROLOGIC MODELS,
Geological Survey, Washington, D.C.
J. Amorocho.
Progress of Hydrology, Vol 1, p 420-472, July 1969. 53 p, 12 fig, 37 ref.

Descriptors: *Hydrology, *Mathematical models, *Optimization, *Water storage, Operations.
Identifiers: *Determinism, *Non-linear models, Functional model, Conceptual model.

The impossibility of formulating any real hydrological situation in strictly deterministic terms because of the problems of time variability, input, output and systems uncertainties, and system representation was discussed. The various types of deterministic models in hydrology were described and examples of their use were given. First, operational representation was described where 'operators' contained in the equations perform mathematical operations on a set of variable to produce a function of these variables. An operational representation of a simple storage system was an example. Functional representation described another way of representing a system. A third major category of deterministic models comprised structures in which a schematization of the hydrologic unit is performed. The name 'conceptual model' was given to this idealized process. The flow diagram of a model which attempted to synthesize the operation of a natural system, termed 'hydrologic systhesis,' was shown. The fact that most methods of the deterministic approach are still in an exploratory stage was summarized. (Kriss-Cornell)

SYSTEMS APPROACHES IN HYDROLOGY AND WATER RESOURCES,
Illinois Univ., Urbana. Dept. of Civil Engineering.
Ven Te Chow.
Progress of Hydrology, Vol I, p 490-509, July 1969. 20 p, 4 fig, 9 ref.

Descriptors: *Hydrology, *Stochastic processes, *Systems analysis, *Water resources development, Mathematical models, Simulation analysis, Economics, Education.

The objective of this paper was to recapitulate current thinking on hydrologic systems, to describe stochastic hydrologic systems, and to discuss hydrologic systems and hydro-economic systems in water resources planning and development. Various parts of the hydrologic system were said to be interception, evaporation, transpiration, infiltration detention, retention, surface runoff, subsurface runoff and groundwater flow, and were considered as hydrologic subsystems. An open-loop system and a closed-loop system were described. Mathematical simulation of natural hydrologic systems achieved by means of either a lumped-system model or a distributed-system model was discussed. Comparisons of non-linear and linear systems, time variant and time-invariant and deterministic and probabilistic were made. Questions posed on the mathematical simulation of the hydrologic system of watersheds at the International Hydrology Symposium in 1967 were restated with some modification. A comparison of the conventional approach and the stochastic approach in hydrologic systems analysis was illustrated. A view of the system approach as part of the hydroeconomic system for water resources planning and development was shown through an outline of the educational programs in water resources engineering followed by many universities. DETERMINISTIC LINEAR HYDROLOGIC SYSTEMS,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
Peter S. Eagleson.
Progress of Hydrology, Vol I, p 400-419, July 1969. 20 p, 38 ref.

Descriptors: *Linear programming, *Mathematical models, *Optimization, *Groundwater movement, Surface runoff, Reservoirs, Hydraulic systems.
Identifiers: Determinism, Identification problems.

This paper attempted to answer the question of why hydrologists devote so much time to linear deterministic methods in a non-linear stochastic real world. A reply was given with respect to determinism and with respect to linearity. Mathematical representation of linear systems was described using differential equations and integral equations. The approach to finding the kernel of a linear hydrologic system through the solution to the linearized differential equation which best represents the phenomenon of interest was proposed. Surface runoff, infiltration and capillory use, and groundwater motions were considered. A second approach to finding the kernel of a linear hydrologic system was through a synthesis of system behavior in terms of one or more lumped elements which reproduce, in linear form, the primary hydraulic operations such as storage and translation of concern to the phenomenon being modelled. Linear reservoirs, linear channels, combined linear elements and conceptual linearization were considered. The problem of determining the system kernel, or 'the identification problem,' was discussed. Identification of either truly linear or optimally linear systems was distinguished. 'Black box' methods or 'parametric' methods were regarded as further subdivisions of the identification problem. A review of techniques for finding linear kernels given observations of system input and output was given. (Kriss-Cornell)

THE COMPUTER AND HYDROLOGY,
California Univ., Riverside. Dry-Lands Research Inst.
Warren A. Hall.
Progress of Hydrology, Vol I, p 226-232, July 1969. 7 p.

Descriptors: *Computers, *Hydrology, *Parametric hydrology, *Stochastic processes, Statistical methods, Mathematical models.

A brief review of the trends toward mathematical sophistication in hydrology was presented in order to put in proper perspective some ideas of the role of computers in the future of hydrology. Included were: the parametric approach, i.e., the identification of a set of parameters which described the 'state' of the watershed and the functions by which state determines the response to the input precipitation function; and the stochastic approach which used direct statistical analysis to estimate the average return period between floods at any given magnitude. Both of these procedures have received a major impetus with the advent of the computer. Some of the shortcomings of the present computer based developments in hydrology were discussed. It was felt that the most urgent concern was for the application of systems identification and similar analytical techniques to develop physically based

d physically describable models of the principal teractive hydrological processes. (Kriss-Cornell)

entifiers: Iowa's water permit system.

e three objectives of this study were: (1) to alyze Iowa's water permit system, constructing estimate of the system's allocation in times of ter scarcity; (2) to construct a model which will eld in specific situations both an optimum water e pattern and values for water in its various uses;) to apply the model developed in objective two d the estimate constructed in objective one to a ecific situation. Three procedure phases were scribed. The first phase was examined as a physi- l and as a economic entity and then the necessary d sufficient conditions for optimum resource al- cation were derived. The second analytical phase amined origins and general characteristics of al- cative mechanisms currently in use in the United ates. A specific hypothesis based on Iowa's per- t system was developed and a general model hich utilized linear programming to describe the teraction between hydrologic and economic stems, generating approximate values for water timally allocated among various uses, was veloped. The third phase of the study was empiri- l and consisted of application of the linear pro- amming model to two water use situations, one al, the other hypothetical. A description of the sults of the applications was given. Recommen- tions for further research were suggested. (Kriss- rnell)

INVESTMENT ANALYSIS UNDER UNCERTAINTY
Stanford Univ., Calif. Graduate School of Business.
Robert Wilson.
Management Science: Application, Vol 15, No 12, Aug 1969, pp B650-664. 15 p, 2 fig, 11 ref, 1 append.

Descriptors: Investment, Analysis, Interest, Mathematical models, Time, Project planning, Diversification, Risks, Optimization, Design.
Identifiers: Event tree, Smoothing effect.

Investment projects were described as a pattern of uncertain cash flows over time; i.e., as a cash flow pattern over an event tree. Sufficient conditions for accepting and rejecting individual projects were formulated as mathematical programming problems which were amendable to routine application at subordinate levels of an organization. The time dimension of a state description was made explicit by constructing the 'event tree' specifying the sequence of states that it can obtain. An example of the event tree over four time periods was given where the number of possible states was finite, each state had only one successor node, and each node had only one predecessor arc. An abbreviated project description was used for the purpose of analysis of the state-relevant description of investment projects. The methodology of investment analysis under uncertainty was described where two characteristic rationale were used: 'smoothing' effect and 'diversification' effect. Examples were given. The sufficient conditions for inclusion of projects and exclusion of projects and the systematic analysis of these solutions were investigated. Finally, a mathematical programming formulation was developed which embodied measures of risk aversion and intertemporal income preferences. The optimal design of a complementary financing program for a project yielded inclusion criteria for its acceptance, and analysis of the borderline case between risk aversion and risk preference yielded an exclusion criterion. This paper has relevance to water resources investments having uncertain future returns. (Kriss-Cornell)

SOME ASPECTS OF EDUCATION AND RESEARCH IN STOCHASTIC HYDROLOGY,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
Vujica Yevjevich.
The Progress of Hydrology, Vol I, pp 316-333, July 1969. 24p.

Descriptors: *Stochastic processes, *Hydrology, Mathematical modes, *Statistical methods, *Digital computers, *Hydrologic data, Engineering, Data collection.
Identifiers: Time-space trade.

Some crucial subjects considered as being significant for education, researchand practical developments in hydrology for the next decade were presented. First three types of hydrologic processes: deterministic, stochastic and combined deterministic-stochastic were described. The roles of probability theory, mathematical statistics and stochastic processes in hydrology and water resources were catagorized into three types and can be applied in advancement in research and education. Discussed was the use of computers in hydrology especially the digital computer which has made many hydrologic equations, methods and procedures of pre-computer age absolete. The problem of hydrologic data scarcity and the application of statistics was also discussed. Two basic and opposite approaches used in design of a hydrologic observation system mentioned: were a) hydrologic approach, which includes climatologic, hydrogeologic, general geophysical and similar points of view; and b) engineering approach, which is dominated by civil, hydraulic or sanitary engineering points of view. Other topics included were: transfer of hydrologic information from point to point, transfer of information from one hydrologic variable to another, risk and uncertainty in hydrologic information, procedures for extracting the most information from a given hydrologic amount of data and effect of additional short-term observations on total information. A time-space trade concept was explained which is a promising approach for regions with crucial scarcity of data. (Kriss-Cornell)

PRODUCTION AND INVESTMENT IN NATURAL RESOURCE INDUSTRIES,
Montana State Univ., Bozeman; and Resources for the Future, Inc., Washington, D.C.
Oscar R. Burt, and Ronald G. Cummings.
American Economic Review Vol LX, No 4, p 576-590, September 1970.

Descriptors: *Optimization, Depreciation, Discount rate.
Identifiers: *Social benefit function, User-cost, Lagrangian expression, Opportunity cost.

The authors develop a general model for social production and investment in natural resource industries which can be adapted to any specific resource. The social benefit function is formulated subject to constraints and the Lagrange method used for a solution. The optimum time paths for production and investment are generated by the model while assuming society's planning horizon is finite. The decision rule for the optimum time path of resource use is to increase production until net marginal social benefits equal user costs (as defined in the model). The optimum time path for social investment occurs when the marginal social cost of investment in the current period is equal to the discounted value of the increment to all future capital stocks associated with an increment to current investment. The model is generalized to include multiple interrelated resources and capital stocks and infinite planning horizon. This model is of interest to water studies concerned with planning the development of water resource sites. (Siegenthaler-Rutgers)

COMMENTS ON TIME-CAPACITY EXPANSION OF URBAN WATER SYSTEMS,
Cornell Univ., Ithaca, N.Y.
Marshall Gysi.
Water Resources Research Vol 6, No 3, p 993-995, June 1970.

Descriptors: *Water supply, *Mathematical models, *Demand, *Forecasting, Economic evaluation, Prices, Cost minimization, Maximization, Optimization, Economies of scale, Water shortage, Dynamic programming, Benefits.
Identifiers: *Community surplus, *Over-demand, Derived demand.

The author elaborates on a method previously developed by Russell Scarto for estimating a more economically efficient capacity expansion schedule for a municipal water supply utility. He points out that recent studies on consumer demand relationships for water provide information that should be included in mathematical models which have as their object the maximization of the net present value of future community economic surpluses. In planning for system capacity a less than infinite penalty cost should be included for optimum welfare. The author outlines how losses due to overdemand can be estimated from the consumer's demand function. He presents a dynamic programming approach for the estimation of the expansion path of the water supply facilities which maximizes the present value of future marginal net benefits to the community. The article concludes with a statement of the importance of further research in the area of water pricing and consumer demand. (Murphy-Rutgers)

PRICE DISTORTION AND ECONOMIC WELFARE,
Minnesota Univ., Minneapolis; and Pennsylvania State Univ., University Park.
Edward Foster, and Hugo Sonnenschein.
Econometrica, Vol 38, No 2, p 281-297, March 1970.

Descriptors: *Welfare economics, *Model studies, *Economic evaluation, *Mathematical studies, *Taxes, Prices, Optimization, Social aspects, Government, Government supports, Budgets, Equilibrium, Costs.
Identifiers: *Subsidies, *Marginal rate of transformation, *Marginal rate of substitution, Utility, Economic distortion.

This paper presents an economic model in which equilibrium positions are characterized by specified inequalities between society's marginal rates of transformation in production and consumers' marginal rates of substitution in consumption. This condition is often present in water resource development projects due to the presence of externalities in both the consumption and production of a water supply system. The authors use the device of certain mapping defined on the set of efficient production in order to investigate the effect on welfare from changes in the inequalitites. The paper proceeds to derive the mathematical restrictions which these mappings must satisfy in order to yield positive results and to specify what conditions are necessary for these restrictions to hold. The analysis leads to the conclusion that a radical decrease in a specific economic distortion will improve welfare. (Murphy-Rutgers)

OPTIMALITY, 'PUBLIC' GOODS, AND LOCAL GOVERNMENTS: A GENERAL THEORETICAL ANALYSIS,
Northwestern Univ., Evanston, Ill.
Mark V. Pauly.
Journal of Political Economy, Vol 78, No 3, p 572-585, May/June 1970.

Descriptors: *Optimization, Marginal utility, Marginal costs, Migration.
Identifiers: *Public goods, Net benefits, Pareto optimal, Edgeworth box, Neighborhood effects.

This paper attempts to reconcile divergent analyses with respect ot the Pareto optimality conditions in the provision of a public good by politically separate local governments. The confusion has occurred because of the failure of researchers to specify in what way the local public good being considered has elements of publicness. To clarify matters, four cases of goods within and between communities are considered: (1) purely private, (2) purely public, (3) purely public good within but private between, (4) impurely public within but private between communities. In each case, the pure public good in the Samuelson sense is identified and equilibrium and optimality conditions for that good are specified. The actual element of publicness for each case is analyzed and the deviation from the optimum is shown for local government actions. Special attention in case four is given to the problem of education and migration, and the author shows some departures from the optimum. This analysis is of relevance to water managers concerned with the welfare implications of water resource development. (Siegenthaler-Rutgers)

A NOTE ON ENGINEERING EMPIRICISM AND ECONOMIC THEORY,
Oak Ridge National Lab., Tenn.
Duane Chapman.
Engineering Economist Vol 15, No 4, p 243-248, Summer 1970.

Descriptors: *Cost minimization, *Mathematical studies, *Optimization, *Economic evaluation, Prices, Engineering, Estimated costs, Cost analysis.
Identifiers: *Homogeneous production function, Lagrangian optimization, *Scale factor.

The author explores the linkage between the economic concepts of the homogeneous production function and Lagrangian optimization and the use, in engineering cost estimates, of a scale factor in cost extrapolation. A common example of a scale-factor equation in engineering design is given. This equation can be derived by minimizing the cost of production for any fixed output point for a homogeneous production function. The author concludes from this analysis that the homogeneous production function and the scale-factor cost equation may be representations of some underlying physical reality. Since engineering and economic concepts are both used in water resource cost analysis this article explains the relationships between these familiar techniques and concepts. (Murphy-Rutgers)

OPTIMAL DEPARTURES FROM MARGINAL COST PRICING,
Princeton Univ., N.J.
William S. Baumol, and David F. Bradford.
American Economic Review Vol LX, 1103, p 265-283, June 1970.

Descriptors: *Welfare economics, *Prices, *Marginal cost, *Taxes, *Optimization, Resource allocation, Mathematical study, Government, Demand, Equilibrium, Social aspects, Elasticity of demand, Profits, Costs.
Identifiers: *General equilibrium, *Second-best, Price elasticity, Excise tax, Income tax, Pareto optimality.

The authors are concerned with those situations where deviations from marginal cost pricing are necessary for optimal resource allocation. This condition has particular relevance for utility pricing and should make the article of interest to pricing policy studies in water utilities. Due to the effects of taxes, the problem is in the area of second best and the solution arises from the theory of taxation and the analysis of public utility regulation. The paper describes the rules indicating whether a particular price-output combination which satisfies the profit constraint is socially optimal. The authors discuss four variants of the usual welfare optimization theorem, each of which gives a set of necessary conditions for quasi-optimal pricing. A simple general equilibrium model is then presented and the effect of taxes on different sectors of the economy explained. The authors conclude their analysis with an outline of the past literature of this problem. (Murphy-Rutgers)

TWO METHODS OF COMPUTING FULL-INFORMATION MAXIMUM LIKELIHOOD ESTIMATES IN SIMULTANEOUS STOCHASTIC EQUATIONS,
IBM Watson Research Center, Yorktown Heights, N.Y.
Gregory C. Chow.
International Economic Review Vol 9, No 1, p 100-112, February 1968.

Descriptors: *Mathematical studies, *Statistics, *Economic evaluation, *Maximization, Least-squares method, Regression analysis, Probability.
Identifiers: *FIML, *Iterative method, Nornal equations, Limited information, Convergence.

This paper attempts to derive an explicit set of equations for full-information maximum likelihood estimates of parameters in a system of simultaneous linear stochastic equations. It also presents two iterative methods of solving these equations. Assuming, all structural equations to be stochastic, a set of normal equations is derived. The author discusses the treatment of identities and linear restrictions on coefficients and gives a numerical example. This article is relevant to the water researcher interested in the use of simultaneous equation systems for estimating water models. (Murphy-Rutgers)
W71-00774

SOME EFFECTS OF INCORRECT SPECIFICATION ON THE SMALL-SAMPLE PROPERTIES OF SEVERAL SIMULTANEOUS-EQUATION ESTIMATORS,
British Columbia Univ., Vancouver.
John C. Cragg.
International Economic Review Vol 9, No 1, p 63-86, February 1968.

Descriptors: *Mathematical studies, *Economic evaluation, *Model studies, *Statistics, Sampling, Least squares method, Regression analysis, Probability.
Identifiers: *Misspecification, Ordinary least squares, Two-stage least squares, Estimators.

This paper provides some sampling experiment results exploring the effects of certain misspecifications on several simultaneous equation estimators. The main type of misspecification investigated is the incorrect exclusion of variables from certain equations or the model itself. Experiments are reported where important non-zero coefficients were specified to zero in the structure estimated and there is a discussion of the effects of the specification of small coefficients to be zero in order to obtain identification. The omission of an exogenous variable from the estimated structure is considered along with the related aspect of omitting an equation. The last problem discussed is that of the effects of failing to specify as zero all the structural coefficients for which such a specification would be valid. The general conclusion of the author, is that the different failures of specification investigated may have serious effects and he suggests a difficult task, in econometric model-building, of steering between misspecification and underspecification. This paper is relevant for the choice of variables in econometric studies of water resources. (Murphy-Rutgers)

NONLINEAR SIMULTANEOUS EQUATIONS: ESTIMATION AND PREDICTION,
Princeton Univ., N.J.
Stephen M. Goldfeld, and Richard E. Quandt.
International Economic Review Vol 9, No 1, p 113-136, February 1968.

Descriptors: *Mathematical studies, *Statistics, *Forecasting, *Regression analysis, Sampling, Model studies, Computers, Maximization.
Identifiers: *Two stage least squares, *Direct least squares, *FIML, *Nonlinearities.

This paper analyzes the small-sample properties of the parameter estimates of two specific nonlinear systems. The authors present two models on which they conducted experiments consisting of generating normally distributed error terms, solving the structural equations for the values of the endogenous variables and using the resulting data series to estimate the coefficients of the equations with several techniques. The estimating methods used were; direct least squares, (DLS), full-information maximum likelihood (FIML) and two-stage least squares. The evidence gathered by the authors favor FIML over the two-stage procedures and both over DLS for structural estimation as well as prediction. The potential use of nonlinear equations in econometric water resource studies makes this paper of interest to the water researcher. (Murphy-Rutgers)

COST ANALYSIS OF IMPROVED REGULATION OF THE COLUMBIA RIVER TO I

CREASE MINIMUM FLOW IN THE HANFORD PLANT VICINITY,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Labs.
R. W. Legan, and R. T. Jaske.
AEC Research and Development Report, BNWL-1343, UC-70, June, 1970, p 69. 25 fig, 2 tab, 3 ref. US AEC Contract AT (45-1)-1830.

Descriptors: Temperature, Regulation, Economics, Flow, Hydrographs, Transmission (Electrical), Annual costs, Electric power, Washington.
Identifiers: Hanford plant, Thermal discharge, Penalities, Flow management.

This report reviews the operational history of the week of October 24-31, 1967 with respect to the actual operations of the Priest Rapids Project and the resulting effects on the flow of the Columbia River. These effects are compared with the degree of management also exerted at the McNary project during the time period. The adverse effects of the uncoordinated regulation of the Columbia River are summarized with respect to Washington State temperature standards. The linear program code UMPIRE was used to model the actual conditions and, by superposition, minimum flow constraints ranging upwards from 36,000 cu ft /sec by 10,000 cu ft /sec increments were imposed on the Hanford reach. All scheduled power and energy demands of the Priest Rapids project and the McNary project that existed on that week were met. The economics suggest that large reductions in the cost of proposed navigation channel facilities can be made by basing the channel design on 66,000 cu ft/sec or higher minimum flows in the Hanford reach. The extra cost for energy losses and management represent a small fraction of the construction cost reduction when capitalized. The study shows the great benefits to multipurpose river use from system coordination on a regional rather than a separate private-federal basis as exists currently. (Upadhyaya-Vanderbilt)

SOME NEW VIEWS ON THE PAYBACK PERIOD AND CAPITAL BUDGETING DECISIONS
Rochester Univ., N.Y. Coll. of Business Administration.
H. Martin Weingartner.
Management Science: Application, Vol 15, No 12, Aug 1969, p B594-B607. 14 p, 1 fig, 1 tab, 25 ref.

Descriptors: Analysis, Constraints, Budgeting, Capital, Decision making Optimization, Investment, Cost, Time.
Identifiers: *Payback period, Quantitative concepts.

Water resources and other capital budgeting problems are often solved by use of the payback period, when present value or internal rate of return criteria are inadequate. The Payback Period is the time expected for an investment project to recoup its initial cost. In a discussion of this approach the payback concept was considered in its role as a criterion versus a payback constraint, as a break-even concept, and as a crude measure of the rate of resolution of uncertainty. It was shown that the payback reciprocal as a measure of the rate of return of a project had significance in the context of certainty. It was more appropriate to regard payback as a constraint which a project must satisfy than as a criterion which was to be optimized. The inherent differences between financial investments and investments in capital projects by firms were also discussed. (Kriss-Cornell)

COMMUNITY GOALS-MANAGEMENT OPPORTUNITIES: AN APPROACH TO FLOOD PLAIN MANAGEMENT
Chicago Univ., Ill. Center for Urban Studies.
John R. Sheaffer, George W. Davis, and Alan P. Richmond.
Community Goals-Management Opportunities: An approach to Flood Plain Development. Washington, D.C.: Center for Economic Studies, U. S. Army Engineer Institute for Water Resources, IWR Report No 70-2, May 1970. 209 p, 15 fig, 3 map.

Descriptors: *Flood Plains, *Methodology, *Planning, *Management, Decision-making, Urbanization, Social aspects, City planning, Cities, Community development.
Identifiers: *Flood plain management, *Comprehensive planning, *Urban development/redevelopment, *U. S. Army Corps of Engineers, Water resource management.

This report focuses on the relationships between flood plain management, comprehensive planning, water resource management and urban development/redevelopment. Its primary purpose is to assist the Corps of Engineers in becoming an active participant in urban development/redevelopment where flood plain management is involved. A four-step decision-making model for analysing flood plain management alternatives is outlined. The normative model is applied to the demands of four case studies. Results point up the benefits which could be realized if flood plain management and urban development/redevelopment were related. Operational and programmatic implications are identified and discussed. (Wexman-Chicago)

THE ECONOMICS OF CLEAN WATER, SUMMARY.
Federal Water Pollution Central Administration, Washington, D.C.

I67.1/2:970 Summary For sale by the Superintendent of Documents, U. S. Government Print Office, Washington, D.C. 20402 Price $0.50 per copy. Report, March 1970. 41 p, 2 fig, 16 tab.

Descriptors: *Economics, *Waste water treatment, *Investment, Decision-making, Political aspects, Social values, Legislation, Evaluation, Chemical wastes.
Identifiers: *Policy decisions, Municipal grant legislation, Economic analysis, Animal wastes.

The basic product of this study is the definition of a rate of investment that will close the gap for municipal and industrial waste treatment within a five year period, given the continued pertinence of today's regulatory and technological conditions. Detailed studies of the pollutional impact of the inorganic chemicals industry and of concentrated animal populations are submitted as separate subreports. Several issues germane to the policy decisions required with expiration of current municipal grants legislation are discussed. Economic analysis can provide insights into the consequences of alternative actions, but the political process must in the final analysis mold the necessary decisions within the context of total national interests and values. (Davis-Chicago)

THE ECONOMICS OF CLEAN WATER, VOLUME ONE.
Federal Water Pollution Control Administration, Washington, D.C.

For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402 Price $1.50 per copy. I67.112:970 Vol 1. Report March 1970. 168 p, 9 fig, 53 tab, 1 append.

Descriptors: *Economics, *Waste water treatment, *Investment, Costs, Industrial wastes.
Identifiers: Federal assistance programs, Public investment, Regional waste water treatment systems.

This volume addresses itself to the basic question of defining a rate interest that will close the gap for municipal and industrial waste treatment, within a five year period. A number of subsidiary issues are also considered, including the influence of industrial waste discharges on public investment outlays, the influence of location on unit investment, the status of broadly integrated regional waste handling systems, the incidence of recapitalization, the influence of price levels on investment, and patterns of change in the real cost of waste treatment facilities. Consideration of these questions was consistently pointed to their relationship to the problem of deriving a normative annual level of investment, one appropriate to five year attainment of an investment equilibrium in the public waste treatment section; and the force of Federal assistance programs on investments is a minor theme that pervades the report. (Davis-Chicago)

WATER-RELATED FACILITIES STUDY FOR THE COMPREHENSIVE REGIONAL PLAN.
Franklin County Ohio Regional Planning Commission, Columbus, Ohio.

Available from NTIS as PB 189 007, $3 in paper copy, $0.95 in microfiche. Franklin County Regional Planning Commission, Columbus, Ohio, Dec

1969. 137 p, 18 tab, 23 plate, 9 fig. HUD Project Ohio Pa46G X-1105-2.

Descriptors: *Planning, *Water resources, *Water management (Applied), *Water policy, Water supply, Water quality, Sewerage, Drainage, Flood control, Aesthetics, Recreation, Financing.
Identifiers: *Comprehensive planning, *Water resources planning, Implementation, Sewage systems, Regional water authority, Franklin County, Ohio.

This report provides a plan for the development and distribution of water supplies, and for flood control, sewerage and drainage, all on a regional scale. The need for both water supply and flood control is emphasized. Water supplies are to be developed from streams with upground storage reserviors, and from wells. On-stream reservoir sites are proposed as flood control projects. Aesthetic and recreational potentials of such a development are pointed out. Sources of funding are listed and implementation through a regional water authority recommended. (Wexman-Chicago)

THE NORTHEAST OHIO WATER DEVELOPMENT PLAN PROGRAM FOR ACTION,
Ohio Dept. of Natural Resources, Columbus; and Stanley Consultant, Cleveland, Ohio.
S. L. Frost, and Robert H. Anderson.
Water Resources Bulletin, Vol 6, No 4, p 550-555, July-August 1970.

Descriptors: *Water Resources Development, *Water management (applied), Watershed management, Water pollution control, Water supply, Coordination, Social aspects, Economics, Environment.
Identifiers: *Northeast Ohio.

The Northeast region is one of five major water planning management regions in Ohio. Environmental problems associated with the growth of the Northeast Ohio metropolitan region are a serious threat to this heavily populated area. If Northeast Ohio is to continue to grow and be an acceptable and desirable place to live, total systems management of water resources and waste product disposal is a must. The Northeast Ohio Water Development Plan will include water management programs for the next several decades. Guidelines for growth and specific project recommendations will be developed, but with realization that the plan must be flexible and sensitive to changing sociological, economic and environmental conditions. The initial volumes of this report have already been published. It was recommended that the comprehensive plan involve consideration of eight major categories: regional growth, water supply, water quality and pollution control, water reclamation and reuse, recreation, solid wastes, erosion and flood control, and institutions (governmental and financial). The program is designed to take advantage of Federal grants for studies and plan formulation. Separate studies should be undertaken under each of the programs. The Northeast Ohio Water Development Plan would then emerge as a series of reports coordinated and drawn together by a project management team under the guidance of the Dept. of Natural Resources. (Marriott-Chicago)

EVALUATING SUBJECTIVE RESPONSE TO THE RECREATION ENVIRONMENT: A QUANTITATIVE ANALYSIS OF DISSIMILAR PREFERENCES FOR THE VISUAL CHARACTERISTICS OF BEACHES,
Northwestern Univ., Evanston, Ill. Dept. of Civil Engineering.
Edward S. Neumann, and George L. Peterson.
Outdoor Recreation Opportunity Needs and Desires, Technical Report no. 1, Evanston, Illinois, February 1970. 176 p, 18 fig, 14 photo, 25 tab, 62 ref. U. S. Public Health Service Grant No 5 R01 EC 00301.

Descriptors: *Mathematical models, *Methodology, *Recreation facilities, *Planning, *Recreation demand, *Beaches, Swimming, Aesthetics, Social aspects.
Identifiers: *Visual characteristics, *Subjective responses.

In order to design an urban environment which will provide maximum benefits at a minimal cost, the planner must develop ways to analyze its effectiveness in meeting a broad range of human needs. Outlined here is a general conceptual and analytical approach to evaluate human response to the visual aspects of the recreation environment. A man-environment interaction is expressed mathematically as R-f (x), i.e., response is a function of environmental characteristics. An outline is made of methodological techniques with three structures indicated: response is quantitatively modeled in a manner which permits analysis of differences among individuals; environmental characteristics are modeled in a manner which permits analysis of the differences which may exist among different types of environments; mathematical transformations are used to specify the relationships between response, environmental characteristics, and other attributes of the individual. In the first chapter a man-environment response relationship is hypothesized with a series of simulated beach environments and a sample of beach users utilized to test and verify the model. Next, relationships between user response and other user attributes are examined to determine whether subjective preference is also related to other variables relevent for evaluating environmental effectiveness. Finally, the hypothesized mathematical preference model is examined to determine its strong and weak points. (Preckwinkle-Chicago)

REVIEW AND INTERPRETATION OF EXPERIENCES IN WATER RESOURCES PLANNING,
Resources for the Future, Inc., Washington, D.C.
Irving K. Fox.
In: Organization and Methodology For River Basin Planning, Atlanta, Georgia Institute of Technology, 1964, p 61-88.

Descriptors: *Planning, *Water resource development, *River basins, Canals, Government, Rivers, Water law, Federal jurisdiction, Tennessee Valley Authority, Costs, Economic evaluation, Optimization, Economic efficiency, Benefit cost analysis.
Identifiers: *Planning history, *Pre-World War II planning, *Post World War II planning, *Value optimization, *Administrative efficiency.

In this paper the author presents his interpretation of the significance of recent studies and experience for water resources planning in this country. The first part of the paper presents a broad overview of the main features of past water resources planning up to World War II. The second part is concerned with water resources planning since that time and seeks to examine the alternative approaches which have been used in recent years. The author distinguishes the six approaches which have been attempted and evaluates them on the basis of their administrative efficiency as well as their economic efficiency. (Murphy-Rutgers)

ORGANIZATION AND METHODOLOGY FOR RIVER BASIN PLANNING.

Atlanta, Georgia, Water Resources Center, Georgia Institute of Technology, 1964, 561 p.

Descriptors: *Planning, *River basin development, *Management, *Government, Economic evaluation, Hydrology, Rivers, Flood control, Recreation, Cost, Water supply, Water pollution, Navigation, Hydro-power, Irrigation, Conservation, Engineering, Financing, Optimization, Social aspects.
Identifiers: *U. S. Study Commission, *Southeast River Basins.

This book is based on the results of a seminar and represents a number of opinions regarding the state of the art of comprehensive river basin planning. Specific attention is given to the completed work of the U. S. Study Commission (USSC) for the Southeast River Basins (SERB). The history of the USSC-SERB is presented and a summary description of its report is provided in the introduction. The book is organized in the same manner as the seminar and consists of papers presented on the USSC-SERB experience as well as on the general nature of river basin planning. These are followed by several discussants presenting critical evaluations of the main paper. The background and perspective in Federal river basin planning is discussed followed by papers on the organization and procedures of the USSC. The basic studies concerned with the economic, hydrologic, climatic, engineering, geology and cost aspects are explained and criticized. Functional studies dealing with the specific aims and objectives of river basin planning are also given. The different aspects of plan preparation are then discussed and in the final section, there is an evaluation of USSC-SERB program. (Murphy-Rutgers)

WATER SUPPLY, ECONOMICS, TECHNOLOGY AND POLICY,
California Univ., Los Angeles; Rand Corp., Santa Monica, Calif.; and Indiana Univ., Bloomington.
Jack Hirshleifer, James C. DeHaven, and Jerome W. Milliman.
Chicago, University of Chicago Press, 1969, 386 p.

Descriptors: *Water supply, *Economic evaluation, *Technology, Prices, Water quality, Hydrology, Water distribution, Natural resource allocation, Economic justification, Costs, Marginal costs, Average costs, Time, Risks, Taxes, Government, Capital costs, Desalination, Irrigation, Flooding, Water law, Decision making, Economic efficiency, Economic welfare.
Identifiers: *New York, *California, Feather River, Hudson River.

This book provides an introduction to the application of economic and technological knowledge to the solution of practical problems in the area of water supply. The water problem as it pertains to the future availability, price, and quality of water is discussed followed by an explanation of the present state of water resources development. The authors apply economic analysis to the problem of utilizing existing water supply and explain and criticize the usual allocation process. Theoretical principles of correct pricing are applied in the practical context of municipal water utilities and present industry pricing practices are criticized. The authors investigate the theoretical criteria for determining when expansions of water supplies should take place and which of the many technologically possible projects should be adopted. The portions of the hydrologic cycle from which supplies of water may be obtained are discussed as well as the technological propspects and the costs of procuring, treating and distributing water in a variety of ways. Following an explanation of the relevant water law, there are two case studies of areas which experiences a water shortage. (Murphy-Rutgers)

VALUES AND CONCEPTS IN CONSERVATION,
Oregon Univ., Eugene.
Edward T. Price.
In: Readings in Resource Management and Conservation, edited by Burton, Ian and Kates, Robert W., Chicago, University of Chicago Press, 1965, pp 237-254.

Descriptors: *Natural resource development, *Conservation, Resource allocation, Government, Population, Water power, Air pollution, Land, Technology, Economic evaluation, Waste, Risk, Taxes, Social aspects.
Identifiers: *Laissez-faire, Time preference, Socialization.

This article considers the ideological foundations of natural resource conservation as a means to future material welfare. The author considers certain basic values and ideas, such as limitations on the future of primitive man, the expanding future of industrial man, self-identification with the people of the future, and the population of the future. The conventional concepts of resources and the limits of natural resources are surveyed. Based on these results, objectives of conservation policy are suggested. Some of these include: even utilization over all time, preference for the present, prevention of waste, protection of potential resources, and group effect on resources. Conservation techniques in both capitalistic and communistic economies are compared and used to show the need for government intervention in conservation problems. This need arises from the failure of laissez-faire in the area of resource use by the individual who closes pragmatism over conservation. This article has general relevance to water resources by providing background thoughts on the conservation theme. (Murphy-Rutgers)
W71-00746

THE CONTRIBUTION OF PAST METHODS TO PRESENT DAY PLANNING,
Victoria Univ. (British Columbia).
W. R. Derrick Sewell.
In: Regional Planning-Challenge and Prospects, ed. by Hufschmidt, M. M. New York, Frederick A. Praeger, 1969, p 92-97.

Descriptors: *Planning, *Environmental effects, *Water quality control, Recreation, Water pollution, Air pollution, Technology, Floods, River basins, Investments.
Identifiers: *Flexibility, Uniformity, Resource utilization, Social scientists.

The author discusses the present state of the planning industry in such widely diverse areas as traffic congestion, urban sprawl, water and air pollution, and outdoor recreation. The goal of all these planners is environmental quality, and the author suggests a need for some type of comprehensive environmental planning to organize these various planners and goals. Three major aspects of such comprehensive planning are discussed. First is the scope and content of such planning. The need for flexibility is pointed out, and defended by study of the river basin plan. The article also notes that complete environmental control is neither possible nor desirable. The second major problem concerns who will perform comprehensive planning. The author proposes either a group of well-rounded 'superplanners' or a group composed of experts from individual fields. Finally, the author discusses when comprehensive planning may become a reality. He suggests that the water resources field has provided good examples of what (or what not) to do since the 1930's. This experience provides significant assistance to present day comprehensive planners. (Murphy-Rutgers)

THE EFFICIENT PRODUCTION OF EXTERNAL ECONOMIES,
Maryland Univ. College Park; and Harvard Univ., Cambridge, Mass.
Mancur Olson, and Richard Zuckhauser.
American Economic Review Vol LX, No 3, p 512-517, June 1970.

Descriptors: *Welfare economics, *Economic evaluation, *Economies of scale, *Diseconomies of scale, *Spillovers, Cost minimization, Social aspects, Optimization, Resource allocation, Economic efficiency, Prices.
Identifiers: *Externalities, *Pareto optimality, Market adjustment, Collectivization.

External economies are often present in the water utility and hydroelectric power industries. This condition may yield the conclusion that regulation is necessary in order to achieve Pareto optimality. However, this conclusion has recently been rejected by some economists. This paper argues that the conclusion is valid and that those who do not agree have failed to understand that external economies are produced with different degrees of efficiency and that independent adjustment will generally lead to an inefficient level of output as well as an inefficient method of production. Thus, society is forced to pay more for the suboptimal supply of the good than it would have to pay for the larger amount which an ideal collective arrangement would provide. The paper concludes by presenting some theoretical and policy insights suggested by the analysis. (Murphy-Rutgers)
W71-00749

EXCLUSION COSTS, EXTERNAL ECONOMICS, AND MARKET FAILURE,
Manchester Univ. (England).
R. Millward.
Oxford Economic Papers Vol 22, No 1, p 25-38, March 1970.

Descriptors: *Costs, *Benefits, *Economic efficiency, *Welfare economics, Production, Prices, Equilibrium, Joint costs, Demand, Economies of scale, Maximization, Model studies.
Identifiers: *Exclusion costs, *Public goods, *Externalities, Pareto efficiency.

The author seeks to examine the role of the exclusion principle in the explanation of external economics. A static social welfare maximization model is presented and the reasons why the circumstances of either increasing returns to scale or the presence of externalities precludes achievement of a welfare optimum are explained. The relationship between externalities and joint supply are explored and a distinction made between production costs and exclusion costs. To the extent that all marketed goods and services involve some exclusion costs, then efficient solutions are never attainable by market system. Only an economy ruled by a dictator, with complete knowledge of consumer preferences, could achieve the best solution. The exclusion problem is clearly present in the water resources area. The principles discussed in this paper should provide the planner of public water resource investments with a theoretical framework in order to evaluate the exclusion problems involved with certain uses of water (e.g. outdoor recreation). (Murphy-Rutgers)

THE ABANDONMENT DECISION UNDER UNCERTAINTY,
Norwegian School of Economics and Business Administration, Bergen.
Carl J. Nostrom.
Swedish Journal of Economics, Vol 72, No 2, p 124-129, June 1970.

Descriptors: *Risk, Optimality, Markov processes, Discount rate, Probability.
Identifiers: *Abandonment, Expected cash flow, Dynamic programming capital budgeting, Present value, Matrix.

The essential characteristic of the abandonment problem is that the decisions are made sequentially and under uncertainty. The author considers two approaches to this problem. The objective of the firm is to find a method which maximizes, at a given rate of discount, the expected present value of the total cash-flow resulting from the equipment to be abandoned. The Expected Cash-Flow (ECF) approach maximizes the present value of keeping and then selling equipment to satisfy optimality conditions. The author demonstrates the decision given by the ECF method is not optimal and leads to a tendency to sell too soon. The Dynamic Programming (DP) approach equals the expected value of equipment to abandonment time. This approach gives correct results but may not be feasible because of the complexity of the calculations. However, Markov programming may be helpful in some cases toward a solution. When the ECF decision is to keep the equipment, the DP decision is consistent. Thus, it is not necessary to know the optimal policy. This discussion may prove helpful to water planners concerned with capital budgeting. (Siegenthaler-Rutgers)
W71-00761

RESOURCE ALLOCATION AND THE REGULATED FIRM,
Bell Telephone Labs., Inc., Murray Hill, N.J. Data System Engineering Div.
Elizabeth E. Bailey, and John C. Malone.
Bell Journal of Economics and Management Science, Vol 1, No 1, p 129-142, Spring 1970.

Descriptors: *Resource allocation, Regulatory constraints, Capitalization.
Identifiers: *Regulated firm, Fair return on investment, Profit maximization, Monopoly firm, Mark-up, Lagrangian function.

The regulated firm is considered under a variety of management objectives and regulatory constraints to analyze the effects of the constraints and objectives on resource allocation. The alternative management objectives are profit maximization, sales maximization, return on investment and output. The regulatory constraints are fair return on investment, fair mark-up on costs, fair profit per unit production and fixed profit. The Lagrangian function for each objective is formulated subject to the constraints. The results indicate profit-maximizing firms subject to fair return investment overcapitalize with sales maximizing firms undercapitalizing. Companies subject to a fair return on investment use a nonminimum cost allocation of resources regardless of the management objectives used. Whether the fair return on investment is a management objective or a constraint, there is undercapitalization. The fair mark-up on costs and fixed profit constraints tend to encourage nonproductive resource use when demand is inelastic. The fair profit per unit production is the only constraint guaranteeing minimum cost operation by a profit or sales maximizing firm. This constraint results in efficient resource allocation and discourages the maintenance of nonproductive resources. This analysis is relevant for water planners concerned with economic efficiency in water utility management. (Siegenthaler-Rutgers)
W71-00762

CONSTRAINTS ON PUBLIC ACTION AND RULES FOR SOCIAL DECISION,
Princeton Univ., N.J.
David F. Bradford.
American Economic Review, Vol LX, No 4, p 642-654, September 1970.

Descriptors: *Decision-making, *Cost-benefit analysis, Welfare economics, Public investment, Rate of return, Constraint.
Identifiers: *Dorfman paradox, Social discount rate, Perpetuity value, Present value, Time preference.

This paper is concerned with an analysis of the Dorfman paradox and more generally the prescriptive forces of cost-benefit analysis. In his research on project-specific social discount rates, Robert Dorfman presents two formulas, one using present values and the other equivalent annual perpetuity streams to generate a social discount rate for use in public investment decision-making. Although the two formulas are symmetric, they yield different values for the social discount rate and lead to different social investment choices. This paradox arises because a competitive equilibrium does not hold in the production and distribution of dated goods or there is an imperfect capital market. For social decision-making, the effect on the income distribution must be considered along with the benefit-cost ratio calculation. For the Dorfman paradox, the appropriate social discount rate will hinge on the type of income transfers considered feasible or in other words, the constraints of social action. Thus, cost-benefit analysis is not adequate as a screening device because it does not give enough details on the gains and losses resulting

from an investment decision. This discussion is of interest to water projects employing a cost-benefit framework for decision-making. (Siegenthaler-Rutgers)
W71-00764

UNCERTAINTY AND THE EVALUATION OF PUBLIC INVESTMENT DECISIONS,
Harvard Univ., Cambridge, Mass.; and Stanford Univ., Palo Alto, Calif.
Kenneth J. Arrow, and Robert C. Lind.
American Economic Review, Vol LX, No 3, p 364-378, June 1970.

Descriptors: *Public investment, *Risk decision-making, Discount rate, Interest rate, Optimization.
Identifiers: *Expected return, Asset holding, Capital market, Pooling.

The authors take the position that risk should be discounted in the same way for public investment as it is for private investment. Using Hirshleifer's work as a basis, a state perference model approach is presented. The article, assuming perfect capital markets, demonstrates that the government should behave as an expected-value decision maker. In the absence of perfect markets, the author presents an approach where individual preferences are relevant for public investment decisions. The article also argues that when risks associated with public investment are publicly borne, the total cost of risk-bearing is insignificant. Thus, the government should ignore uncertainty in public investment evaluation. The discount rate chosen also should be independent of risk. These results are obtained because the government distributes the risk associated with any investment among a large number of people. This discussion is of interest to water research efforts concerned with the investment decision-making process. (Siegenthaler-Rutgers)
W71-00765

CAPITAL RATIONING AND EXTERNAL DISCOUNT RATES,
New York Univ., N.Y.
Edwin J. Elton.
Journal of Finance, Vol XXV, No 3, p 573-584, June 1970.

Descriptors: *Decision making, *Capital market, Linear programming, Market value, Constraint, Rate of return.
Identifiers: *Capital budgeting, *External discount rate, Capital rationing, Cash flow, Objective function, Transaction costs, Asset selection.

This paper contends that external discount rates are important to a firm operating under capital rationing. This position is contrary to previous research. Capital rationing occurs when the firm has no external borrowing opportunities, but the firm's stockholders do have access to capital markets. The author argues that the indifference utility curve for a stockholder depends on the market time or external discount rate for firms of the same risk. This is so because in capital rationing the lending and borrowing curve does not exist. He discusses mathematical programming models for a firm operating under capital rationing and demonstrates that the reinvestment rate depends on the objective function assumed. Since the market discount rate is the appropriate rate to discount cash flow from the firm, the market or external discount rate affects the project selection process. Although a firm may be unwilling to go to the capital market for new funds, the firm is still valued in the market: Thus, capital budgeting precriptions should not ignore the impact of the firm's capital budgeting decision on current market price. This article is relevant to capital budgeting and investment decisions in the water area. (Siegenthaler-Rutgers)
W71-00777

SURVEY OF CAPITAL BUDGETING: THEORY AND PRACTICE,
British Columbia Univ., Vancouver.
James C. T. Mao.
Journal of Finance, Papers and Proceedings, Vol XXV, No 2, p 349-360.

Descriptors: *Decision making, Optimization, Risk, Discount rate, Probability.
Identifiers: *Capital budgeting, Mathematical programming, Cash flow, Present value, Internal rate of return, Payback period, Accounting profit, Certainty equivalent approach.

Wide disparaty exists between the theory and practice of capital budgeting. The theory of optimal investment decisions is premised on the existence of an objective function which the firm maximizes. Current financial theory assumes the firm should maximize the market value of its common shares. The results of firm case studies conducted by the author are consistent with theory on the objective of financial management. In capital budgeting theory, risk is generally measured by the variance of investment return; however, the author suggests the use of semi variance because it is consistent with measurement of the opportunity cost of capital and the case study findings. Theory incorporates risk into investment analysis through either the certainty equivalent approach or the risk-adjusted discount rate method. In practice, firms incorporate risk through the risk-adjusted discount approach. While theorists recommend the internal rate of return or net present value criterion for investment appraisal, the study confirms the prevalence of the payback period and accounting profit criteria in practice. To make theory more operationally meaningful, the author suggests the development of a dynamic model of decision-making, accurate estimates of cash flow, and more stress on growth objectives. This article is relevant to water policy makers concerned with the investment decision process. (Siegenthaler-Rutgers)
W71-00778

THE PROSPECTIVE GROWTH RATE AS A MEASURE OF ACCEPTIBILITY OF A PROPOSAL,
Stanford Univ., Palo Alto, Calif.
R. V. Oakford.
Engineering Economist, Vol 15, No 4, p 207-216, Summer 1970.

Descriptors: *Decision-making, Capital investment interest rate.
Identifiers: *Capital growth rate, Cash flow series, Present worth, Benefit series.

The prospective capital growth rate in financial transactions is specified as an interest rate and is defined as the rate of growth of capital which remains invested in a proposal. If the proposal involves borrowing then the prospective growth rate is the rate at which the unpaid capital balance grows. The author shows that the use of the growth rate as a measure of the attractiveness of a proposal differs depending upon whether the project represents an increment of investment or borrowing. If cash flow represents an increment of investment, a decision-maker should invest if the capital growth rate is greater than the marginal growth rate. If however, the cash flow represents borrowing and the growth rate is larger than the marginal rate, the decision is to reject the increment of borrowing. If the cash flow does not fall into the above two categories, and the decision rule is inapplicable to the formal relationship between present worth and prospective growth rate. With proper application, the two decision criteria will yield the same results for project evaluation except when the cash flow series cannot be identified as an investment increment or borrowing increment. This discussion is relevant to water planners involved with project proposals. (Siegenthaler-Rutgers)

MORE ON THE SOCIAL RATE OF DISCOUNT,
North Carolina State Univ., Raleigh.
J. A. Seagraves.
Quarterly Journal of Economics, Vol LXXXIV, No 3, p 430-450, August 1970.

Descriptors: *Discount rate, *Investment, *Economic evaluation, *Risk, *Government, Taxes, Cost, Cost-benefit analysis, Maximization, Interest rate, Capital, Decision-making, Computers.
Identifiers: *Social rate of discount, *Rate of return, Opportunity cost, Inflation.

The author is concerned with the question of how a given level of investment should be allocated among projects. He interprets the social rate of discount as a minimum rate of return which government projects hould achieve. The selection of this rate of discount is often a difficult task in the evaluation of water resource investments and the provision, by this author, of practical economic criteria for selecting among investments, should be of particular interest to the water resource planner. He recommends the calculation of real internal rates of return and continual reranking of projects by individual agencies and the Bureau of the Budget. The social opportunity cost of capital is estimated by first using the yield on Class A Corporate bonds to represent the risk-free earnings of the private sector after taxes. A risk premium and a tax factor are then added and a factor subtracted for the lower rate earned on additional savings and the expected future rate of inflation. The discount rate controversy has important implications for water investment decisions. Accordingly, this article is relevant to the investment analyses of water resources. (Murphy-Rutgers)

SECONDARY ECONOMIC IMPACT FROM WATER RESOURCES DEVELOPMENT, A CASE STUDY OF FLAMING GORGE RESERVOIR,
Utah State Univ, Logan.
Andrew Bacdayan, and R. S. Whaley.
Available from NTIS as PB-195 439, $3.00 in paper copy, $0.95 in microfiche. November, 1969. 4 p, 10 tab, 6 charts. Utah Resources Series 50. OWRR Project B-003-UTAH (1).

Descriptors: *Cost-benefit analysis, Reservoir sites, Attitudes, Utah, Wyoming, Behavior, *Benefits, Social aspects, Political aspects, Motivation.
Identifiers: Flaming Gorge Reservoir.

The study was limited to a descriptive analysis of the changes in the area surrounding Flaming Gorge. It resulted in several conclusions and recommendations: To study the impact of a project it is almost essential to wait until the new equilibrium has been reached. The downward trend in most of the economic indicators that resulted from the termination of construction activities at Flaming Gorge lasted about 3 years. The rates of increase in local government incomes and expenditures of the study area were substantially greater than for the rest of the state.

RECREATIONAL IMPACT OF RECLAMATION RESERVOIRS,
Denver Research Inst., Colo. Industrial Economics Div.
J. Gordon Milliken, and H. E. Mew, Jr.
Bureau of Reclamation, Department of Interior Summary Report, March 1969. 18 p, 4 fig, 14 photo, 4 ref.

Descriptors: *Recreation, *Reservoirs, Colorado, Economic impact, *Social impact, Recreation demand, Recreation facilities, Swimming, Boating, Camping Water skiing, Water sports, Fishing, Lakes, Multiple-purpose projects, Parks, Economics, Reservoir operation, Scenery, Soical aspects, Use rates.
Identifiers: Lake Granby (Colo), Shadow Mountain Lake (Colo), Horsetooth Reservoir (Colo).

The economic and social impacts of reservoir recreation were explored at three colorado reservoirs during 1968, about 20 years after their construction by the Bureau of Reclamation. Two of the reservoirs, Shadow Mountain Lake and Lake Granby, are adjacent to a scenic natural lake and near Rocky Mountain National Park, where they augment a pre-existing mountain resort area. The other reservoir, Horsetooth, is located at the edge of the foothills near a city of 40,000 persons. Horsetooth Reservoir brought new water-based recreation to a relatively arid part of northeastern Colorado. The study had two major purposes. First, to help improve understanding of some secondary economic and cultural effects of water development porjects, as contrasted to primary economic effects such as irrigated crop production and hydroelectric power generation. Second, to help provide a basis for better quantitative estimates of recreational values in determining the multiple benefits of projects. (Knapp-USGS)

Identifiers: *Australia, *Econometrics.

Large scale water resources development involves the administration of diverse and often competing objectives. Efficiency and quality may be enhanced by the development of an econometric model from which optimal short-run allocation and pricing patterns may be derived. The most appropriate type of model is a competitive partial equilibrium framework using nonlinear programming and with the maximization of social payoff as the specified primary objective function. The degree of attainment of this primary objective would be limited by 2 types of constraint: (1) Political and legal (2) Physical and technical, involving the system of supply, storage and reticulation of water. Developed first was a finite horizon deterministic model for an intraseason situation involving competing demands from irrigation areas and a hydroelectric plant. Later, using empirical data, the model was applied to the Murumbidgee Irrigation Area of New South Wales. The mathematical model and the abstracted empirical data are described. From the solutions obtained, it was concluded that: (1) If resource misallocation is to be minimized, historically determined irrigation water prices are in urgent need of revision and (2) Shadow price information relevant to public policy formation may be generated by such a model. POLLUTION, PURIFICATION AND THE THEORY OF EXTERNAL EFFECTS,
Stockholm Univ., Sweden.
Peter Bohm.
Swedish Journal of Economics, Vol 72, No 2, p 153-166, June 1970.

Descriptors: *Taxes, *Pollution, Marginal cost, Average costs, Profit, Feasibility.
Identifiers: *External effects, Net benefits, Connection costs.

This paper discusses the choice between taxation and centralized purification as a means of regulating pollution. External effects theory, indicates that efficient resource allocation is obtained by imposing a tax on polluters equal to the value of the marginal external effects. This solution results in an optimal level of pollution but doesn't yield positive net benefits. The tax approach may not be valid when the central purification alternative is feasible. When negative marginal external effects are present, the central purification solution is superior to taxation as long as the net benefits from purification are greater than those from taxation, and moreover the optimal marginal cost price for purification is below or above the tax and the external effects are increasing or decreasing. However, the purification scheme is not preferable to the above tax scheme in the case of a decreasing cost industry or when there are increasing negative marginal external effects. This article is of practical importance in providing theoretical guidelines for policy measures to reduce pollution. (Seigenthaler-Rutgers)

ECONOMIC EFFICIENCY IMPLICATIONS OF FEDERAL-LOCAL COST SHARING IN WATER RESOURCE DEVELOPMENT,
Economic Research Service, Washington, D.C.
Harold Emory Marshall.
Water Resources Research, Vol 6, No 3 p 673-682, June 1970.

Descriptors: *Economic efficiency, *Cost sharing, Cost-benefit analysis, Expenditures, Water resource development, Budget constraint.
Identifiers: *Association rule, Public good, User charge, National efficiency benefit, Social benefit, Social cost.

The exact relationship between existing federal cost sharing rules and their efficiency aspects and equity considerations with respect to water resource development are not clearly defined. The problem is whether present cost sharing rules have the effect of inducing local parties to maximize national efficiency benefits or to demand projects that maximize local interests. The Army Corps of Engineers, the Bureau of Reclamation, and the Soil Conservation Service who are involved with cost sharing rules have inconsistent policies and practices on this subject. These inconsistencies have enabled local groups to look for the lowest cost share and thus select production techniques that are socially inefficient. To remedy this situation, the article suggests the use of the association rule that costs be shared in the same proportion as benefits at the margin. Through the use of the association rules and consistent cost sharing rules, local groups can be induced to select socially efficient projects. More specifically, the introduction of higher local cost shares and user charges are mentioned. The implementation of these suggestions would lower social expenditure and result in higher local shares in water resource development. (Siegenthaler-Rutgers)

SOME BEHAVIORAL CHARACTERISTICS ASSOCIATED WITH RESIDENTIAL WATER PRICE CHANGES,
John Hopkins Univ., Baltimore, Md.
Steve H. Hanke.
Water Resources Research Vol 6, No 5, p 1383-1386, October 1970.

Descriptors: *Prices, *Water demand, *Measurement, *Instrumentation, *Sampling, Sprinkling, Domestic water, Social aspects, Economic evaluation, Planning, Time, Water conservation, Income, Water rates, Water management, Statistics.
Identifiers: *Boulder, Colorado, *Interviewing, Socioeconomic aspects.

In this report the author describes the specific types of changes that occurred in consumer behavior after incremental water prices were introduced in

Boulder, Colorado. Interviews were obtained from a random sample of 180 customers. The responses indicated that consumers modified their behavior to take account of the incremental charges. Conservation of water use also increased with time as consumers began to make substitutions and more efficient use of water. Socioeconomic characteristics were found to play a small part in determining attitudes toward meters and water. The author feels that these results enable water managers to more accurately predict behavioral adjustments to water price changes. (Murphy-Rutgers)

MARGINAL COST PRICING WITH JOINT COSTS,
Graduate Centre for Management Studies, Birmingham (England).
J. C. Littlechild.
Economic Journal, Vol LXXX, No 318, p 323-335, June 1970.

Descriptors: *Joint costs, Marginal costs, Demand function, Mathematical programming, Constraint optimality.
Identifiers: *Peak-load pricing, Cost minimization, Consumer surplus, Producer surplus, Joint product.

The author first considers Ralph Turvey's research on the problem of marginal cost pricing with joint products in the context of peak-load pricing. The author shows the optimal rules developed by Turvey can also be derived via programming methods. At optimality, the marginal cost of output in any period equals its marginal cost but the result is indeterminate in the case of equal outputs. The reason for the possible indeterminacy is that production over time is essentially a joint product of durable capital equipment. This is remedied by incorporating demand functions as well as costs into the analysis by maximizing the present value of the producer and consumer surplus subject to capacity constraints. The appendix demonstrates with a technology slightly different from Turvey's under certain conditions decision rules can be obtained whereby marginal cost in any period depends on the values of the parameters as given in that period only. This analysis is relevant for water studies concerned with pricing and investment decisions under uncertainty. (Siegenthaler-Rutgers)

THE PEAK-LOAD PROBLEM: DAVIDSON'S SOLUTION RECONSIDERED,
Georgia Univ., Athens.
Donald Ray Escarraz.
Quarterly Review of Economics and Business, Vol 10, No 2, p 85-90, Summer 1970.

Descriptors: *Peak load, Economic efficiency, Public utilities, Joint costs.
Identifiers: *Marginal cost pricing, Average cost, Plant capacity, Distributional equity.

The peak load problem is concerned with the establishment of utility rates which satisfy the criteria of economic efficiency and distributional equity. The author examines Ralph Davidson's work on this subject. Davidson's solution is to equate period price to long run marginal cost of the same period. The model is based on the concept that off-peak demand and peak demand exist for the same product in different markets with peak demand and peak costs in the primary market determining output and plant capacity. The author finds that the separate market assumption implies price discrimination between time periods because monopoly control prevents price equality. Furthermore, it is shown that Davidson's full cost assumption involves average and not marginal cost pricing. As an alternative, it is suggested the peak load problem might be studied from the view of joint costs and that plant capacity be determined by long run demand and short run supply. The existence of peak demand conditions for water make this article relevant to water research efforts concerned with pricing policies. (Siegenthaler-Rugers)

ON OFF-PEAK PRICING: AN ALTERNATIVE SOLUTION,
Pennsylvania Univ., Philadelphia.
Sidney Weintraub.
Kyklos, Vol XXIII, No 3, p 501-519, 1970.

Descriptors: *Peak load, Marginal costs, Average cost, Economic welfare.
Identifiers: Pareto optimal, User costs, Firm-peak, Free rider, Shifting-peak.

Oscillations in demand for public utility services make it difficullt to devise a rate structure for efficient use of facilities while maintaining pricing equity among different users. This phenomenon is known as the peak-off-peak (P-O-P) pricing problem. The varying prices are attributable to heavy capital costs and relatively unimportant user costs. The author examines Steiner's work on the P-O-P problem. Steiner distinguishes between two cases in his analysis; first a shifting peak where output is uniform at both times but price varies and secondly, a firm peak where prices at peak cover full costs but at off peak, the price is zero. The shifting peak case is criticized because shifting prices violate the Pareto optimal rule since price is not equal to marginal cost. The firm peak case involves free riders because output is free to off-peak users, a result which may be unsatisfactory on equity grounds. An alternative suggested by the author is a pricing policy which maximizes the sum of peak plus off-peak output so this results in a benefit to both groups. This article is of interest to water utility administrators concerned with pricing policy. (Siegenthaler-Rutgers)

THE PEAK LOAD PROBLEM WITH INCREASING RETURNS AND PRICING CONSTRAINTS,
Minnesota Univ., Minneapolis.
Herb Mohring.
American Economic Review, Vol LX, No 4, p 693-705, September 1970.

Descriptors: *Peak load, Resource allocation, Marginal cost, Constraint.
Identifiers: *Social welfare function, Objective function, Scale economies, Quasi-rents.

The variation on the demand for services rendered by public utilities is the subject of this paper. The author shows that the rules for efficient allocation of resources used in the production of peak load commodities are same as those for commodities not subject to short run variations in demand. For both types of commodities, the revenues derived from marginal cost prices will just equal total costs, if and only if, production is characterized by constant returns to scale. In practice, the pricing and investment policies for producing peak load commodities violate the rules for efficient resource allocation. The author develops optimization rules for situations in which one or a combination of pricing restrictions are imposed on government agencies providing a public utility service. First, a deficit constraint is imposed on the production of the public utility service with the result that optimization no longer yields price equal to marginal cost. Next, the deficit constraint and a single price constraint are imposed on the model, with results that revenues no longer equal costs. Finally, the single toll constraint yields a inequality between prices and marginal costs. This analysis is relevant to water planners concerned pricing policies. (Siegenthaler-Rutgers)

SHORT-RUN COST FUNCTIONS OF A MULTI-PRODUCT FIRM,
Pennsylvania State Univ., University Park.
Ronald S. Koot, and David A. Walker.
Journal of Industrial Economics, Vol XVIII, No 2, p 118-128, April 1970.

Descriptors: *Cost function, Marginal cost, Linear programming, Constraint, Least squares regression analysis.
Identifiers: Multi-product, Full capacity, Quadratic, Autocorrelation.

In economic theory, the short run average and marginal cost curves of a firm are U-shaped according to the principle of diminishing returns. Empirically the U-shape is only one hypothesis of the form of the cost function. In this paper, linear, quadratic, and cubic cost functions are tested for a multi-product manufacturing firm using the method of single equation least squares. The results indicate that the short-run total cost functions are linear for each product and for the firm as a whole. The implication is that marginal and average variable costs are constant over the observed range of putputs. The linearity of the total cost function makes it possible to construct linear programming models and decision models. The techniques of this paper have relevance to empirical cost studies of water supply conditions. (Siegenthaler-Rutgers)
W71-00779

THE THEORY OF PUBLIC UTILITY PRICING AND ITS APPLICATION,
Chicago Univ., Ill.
Ronald Coase.
Bell Journal of Economics and Management Science, Vol 1, No 1, p 113-128, Spring 1970.

Descriptors: *Public utility pricing, Marginal cost, Average costs.
Identifiers: *Multipart pricing, Subsidy.

The use of marginal cost pricing is considered as a solution to the public utility pricing problem. Marginal cost pricing implies prices should be made equal to marginal costs even where marginal cost is less than average cost with government subsidies used to maintain production. Problems with this criterion are, first, it promotes the growth of state enterprises over the private sector. Second, the rule tends to redistribute income toward consumers of subsidized products. Third, there is a resource misallocation which results from taxation necessitated by the subsidies. The author auggests the need to examine the total effect of a policy proposal. The stress the role of costs in price determination, he considers a government regulatory decision. The cost to the common carrier of providing services to private industry are the additional costs of the service compared with the total cost incurred if no service was provided. Of importance for decision making are the present and future additional costs and not the historical ones. The regulated firm in competitive situation must respond on the basis of the alternative cost to achieve economic efficiency and survival. This discussion should prove relevant to water area studies concerned with pricing decisions. (Siegenthaler-Rutgers)

his paper attempts to estimate the demand for re-dential water in Boulder, Colorado, under dynam- conditions. It presents an empirical analysis of e effects of changing from a flat rate price struc-re to a metered one for the purpose of establish-g an equilibrium in the water market through anges in demand. The study provides an empiri-l test to determine whether the demand curves r residential water use are negatively sloped and nform to the standard postulates of demand eory. Time series data were used and residential emand broken down into the categories of omestic and sprinkling consumption. The quanti-es of both types of water demanded were signifi-antly reduced by the introduction of a commodity harge and continued to remain at this lower level. he author concludes that pricing policies must be ken into account in forecasting future water de-ands. QUANTITATIVE ANALYSIS OF INDUSTRIAL WATER-USE PATTERNS IN PUERTO RICO,
Puerto Rico Univ., Mayaguez. Water Resources Research Inst.
Ausberto Guilbe.
Available from NTIS as PB-195 639, $3.00 in paper copy, $0.95 in Microfiche. University of Puerto Rico Water Resources Research Institute Report, June 1970. 58 p, 15 fig, 38 tab, 7 ref, append. OWRR Project A-003-PR (3).

Descriptors: *Water utilization, *Waste water disposal, *Waste treatment, *Industrial water, Puerto Rico, Water reuse, Water quality, Water treatment, Water sources, Surveys.
Identifiers: Industrial water use (Puerto Rico).

Water-use characteristics of a sample of factories were studied in several parts of Puerto Rico. The factories belong to the metal, chemical-petrochemical, pulp-paper, and food processing classifications. A questionnaire was employed for this purpose. The two main sources of water intake reported were public utilities and deep wells. Only 32% of the plants reported treating intake water. Cooling, production and distribution of heat and power, and incorporation into product ranked highest of all water uses. Only 20% of the factories reported using evaporative type air cooling systems. Forty one percent reported practicing water reuse. The municipal sewer system, underground disposals, and the ocean ranked highest of all waste water receiving bodies. Sedimentation and neutralization were the most frequently reported waste water treatments. (Knapp-USGS)

6E. Water Law and Institutions

ERIE RR V STATE TAX COMM'N (TAXATION OF RAILROAD BRIDGE OVER A NAVIGABLE RIVER).

293 NY 900, 60 NE2d 31 (1944).

Descriptors: *New York, *Railroads, *Bridges, *Assessments, Canals, Navigation, Taxes, Dams, Navigable rivers, Transportation, Navigable waters, Non-navigable waters, Judicial decisions, Legal aspects, Evaluation, State governments, Legislation.

Plaintiff railroad company sought judicial review of franchise assessments levied by defendant state tax commission on a railroad bridge over a river. Plaintiff contended that the river was not navigable at the crossing point and therefore the bridge was not subject to the tax. Defendant argued that the river was navigable since it had been dammed and canalized, was referred to in the local city directory as navigable, and was designated a public highway by several state statutes. A judgment for defendant was affirmed per curiam. (Liptak-Florida)
W71-00602

COMM'R OF PUBLIC WORKS V CITIES SERVICE OIL CO (REVOCATION OF PERMIT TO MAINTAIN PIER IN TIDAL WATERS).
32 NE2d 277-286 (Mass 1941).

Descriptors: *Massachusetts, *Piers, *Tidal waters, *Regulation, Judicial decisions, Legal aspects, Riparian rights, Access routes, Right-of-way, Permits, Legislation, State governments, Administrative agencies, Navigable waters, Docks, Coastal structures, Riparian waters, Usufructuary right, Prescriptive rights, Riparian land, Oil industry, Supervisory control (Power).

Plaintiff commissioner of public works sued defendant oil company to compel removal of a pier and dolphins that had been erected by defendant over state tidewater under license from the public works department. Plaintiff contended that both the law and the license provided that the right to maintain the structures over state waters was revocable and, upon notice, the structures had to be removed. Defendant argued that the license law exempted valuable structures from the revocation provisions and that the revocation of the permit would impair its riparian right of access to navigable water. Affirming a judgment for plaintiff, the court held that defendant had applied for, and received, a temporary license and could not complain of terms it agreed to upon acceptance of the license. The court also noted that the exemption of valuable structures from the automatic expiration provisions did not extend to plaintiff's discretionary power to revoke. The court did not reach defendant's last contention since the structures were not erected pursuant to defendant's riparian rights but solely on the authority of the license law. (Liptak-Florida)
W71-00603

NORTHERN NEW YORK POWER CORP V STATE (RIPARIAN RIGHT TO SURPLUS WATER FROM LOCK AND CANAL OPERATION).
293 NY 756, 57 NE2d 837 (1944).

Descriptors: *Water rights, *New York, *Riparian rights, *Appropriation, Canals, Locks, Dams, Riparian land, Water supply, Alteration of flow, Riparian waters, Compensation, Damages, Value, State governments, Legal aspects, Judicial decisions, Preferences (Water rights), Inland waterways, Navigation, Gates.

Plaintiff power company brought action against defendant State of New York to recover for water rights appropriated for the construction and maintenance of certain dams and locks. Plaintiff contended that as a riparian owner it was entitled to all surplus water in excess of that required by defendant for the maintenance of the canal and for proper navigation. Defendant argued, as had been established by earlier decision, that plaintiff's water rights were limited to the amount of water flowing through certain openings in one of the dams. A judgment for plaintiff was affirmed per curiam. (Liptak-Florida)
W71-00604

BERT V CITY OF ALLIANCE (CITY'S LIABILITY FOR POLLUTION OF RIVER BY SEWAGE TREATMENT PLANT).
32 NE2d 49-51 (Ohio Ct App 1936).

Descriptors: *Ohio, *Water pollution, *Odor, *Sewage treatment, Pollution abatement, Riparian rights, Riparian land, Water pollution effects, Municipal wastes, Sewage, Sewage effluents, Sewage sludge, Sludge disposal, Waste disposal, Rivers, Waste water (Pollution), Cities, Local governments, Judicial decision, Legal aspects, Adjudication procedure, Remedies.

Plaintiff landowner sought damages and an injunction to restrain the emission of noxious odors from defendant's sewage treatment plant and the discharge of sludge from such plant into a river which ran through plaintiff's farm. Plaintiff contended that defendant's activity constituted a nuisance and injured his enjoyment of his property. Defendant argued that the river was polluted before it reached the sewage treatment plant and that there were no odors emanating from the plant. Affirming the judgment for defendant, the court held that the conflicting evidence of the existence and origin of any pollution and odors was properly submitted to the jury, and the evidence fully supported their finding for defendant. (Liptak-Florida)

SMITH V WATERWORKS BD (CONSTITUTIONALITY OF WATER WORKS INDEBTEDNESS).
175 So 380-383 (Ala 1937).

Descriptors: *Alabama, *Waterworks, *Debt, *Cities, Water supply, Public health, Community development, Cost repayment, Loans, Interest, Public utilities, Judicial decisions, Legal aspects, Municipal water, Water costs, Water conveyance, Water delivery, Financing, Legislation.
Identifiers: *Constitutionality.

Plaintiff taxpayer sought to enjoin incorporation of defendant city's waterworks. The city planned to incorporate its waterworks and to issue bonds to build waterworks facilities. The bonds would be secured by mortgaging and pledging future earnings from such facilities. An Alabama general act authorized this type of financing without a general election for taxpayer approval, since tax revenues would not be utilized to pay the debt. The act declared that a debt thus created would not be a municipal debt. Plaintiff contended that the city would be liable for the debt thus established without taxpayer approval, in violation of the Alabama constitution. In holding for defendant, the court reasoned that a mortgage or pledge from an already-existing, city-owned facility would be a prohibited municipal debt if given without voter approval, but a pledge or mortgage upon facilities to be constructed with the borrowed funds would be solely a debt of the waterworks board. (Hart-Florida)
W71-00610

STATE V BD OF COMM'RS OF CADDO LEVEE DISTRICT (OWNERSHIP OF BEDS OF NONNAVIGABLE WATERS).

188 La 1, 175 So 678-688 (1937).

Descriptors: *Ownership of beds, *Bodies of water, *Louisiana, *Administrative agencies, Levees, Management, Judicial decisions, Legal aspects, Regulation, Administration, Legislation, Projects, Navigable waters, Lakes, Bayous, Streams, State governments, Prior appropriation, Water resources development, Water allocation (Policy), Land tenure, Non-navigable waters.

Louisiana state officials certified and transferred the bed of a non-navigable portion of a bayou to defendant levee board pursuant to an act which granted lands within the levee district to the levee boards. Prior to the certification and transfer, a Louisiana statute was passed which declared the state to be the owner of waters and beds of all bayous, lagoons, lakes, rivers and bays except those under direct private ownership and those transferred as directed by law to a levee board. Plaintiff state and defendant both claimed ownership of the bed of the bayou. The Louisiana supreme court held for plaintiff, concluding that the grant to defendant was repealed by the statute declaring the state as owner of waters and beds of streams such as the land in question. The court determined that the exception clause of the repealing statute referred to private owners of waters and beds and not to the several levee boards whose rights, privileges, and obligations are at all times under legislative control. (Powell-Florida)
W71-00611

HOWELL V CITY OF DOTHAN (ABATEMENT OF NUISANCE CAUSED BY MUNICIPAL WASTES).
174 Sc 624-630 (Ala 1937).

Descriptors: *Alabama, *Pollution abatement, *Sewage, *Water pollution, Cities, Judicial decisions, Legal aspects, Municipal wastes, Riparian rights, Watercourses (Legal), Water rights, Streams, Odor, Damages, Local governments, Sewage disposal, Remedies.

Plaintiff landowner brought action against defendant municipality to abate a nuisance caused by the overflow, diversion and discharge of sewage into a creek adjoining plaintiff's land. Plaintiff also sought damages for the loss of stock due to pollution of the creek and for permanent injuries to his land. The Supreme Court of Alabama affirmed the lower court decree awarding an injunction to plaintiff but denying recovery of damages. The court held that the plaintiff landowner was not entitled to a judgment against defendant for injuries and damage to his land because the evidence was not sufficient as to time of destruction of the timber and of deterioration of the cultivatable land so as to warrant recovery. (Powell-Florida)

WHITE V HUGHES (RELATIVE RIGHTS OF MOTORISTS AND BATHERS TO UTILIZE BEACH).
190 So 446-454 (Fla 1939).

Descriptors: *Florida, *Beaches, *Swimming, *Scenic highways, Atlantic Ocean, Highways, Legal aspects, Judicial decisions, Adjudication procedure, Safety, Scenery, Accidents, Hazards, Legislation, Riparian rights, Competing uses, Relative rights, Riparian land, High water mark, Low water mark, State jurisdiction, Boundaries (Property), Access routes, Public rights.

Plaintiff bather sought damages from defendant motorist for injuries sustained when defendant's vehicle struck him while plaintiff was sitting on the beach. The court held that the right of bathers to use the beach was superior to that of motorists and ruled that: (1) a riparian owner has common rights of access to the adjacent waters in common with the general public, subject to lawful state and federal legislation; (2) the beach of the Atlantic Ocean between high and low water mark is state property, held in trust for all the people; and (3) the state, in the interest of the general welfare, had lawfully designated the Atlantic beach as a public highway, but the authorization to use the beach as a highway was subject to its long-established reasonable use for bathing, recreation and navigation. MCCLUSKEY V MERAUX AND NUNEZ, INC (NAVIGABILITY OF STREAM).
186 So 117-121 (La 1939).

Descriptors: *Louisiana, *Navigable rivers, *Ownership of beds, *Prescriptive rights, Boundaries (Property), River beds, Non-navigable waters, Legal aspects, Judicial decisions, Adjudication procedure, Reservation doctrine, Streambeds, Streams, Beds under water, Boundary disputes, Navigable waters, Land tenure.

Plaintiff landowner brought action to quiet title to property claimed by defendant by prescription. The land in question was separated from defendant's land by a stream. Plaintiff contended that since the stream was navigable, the title to its bed was in the state, and therefore defendant's prescription could not have included the property in question. Defendant contended that the stream was nonnavigable, and consequently his prescriptive title extended across the stream to the land in question. The court found that the burden of proving navigability or non-navigability rested upon the party to whose advantage it would be to establish the fact. The court stated that: (1) where a stream was navigable when a state was admitted to the Union, the streambed became state property by virtue of its sovereignty; and (2) a stream is navigable in law when navigable in fact. Both parties had presented directly contradictory evidence on the width and depth of the stream as of the data Louisiana was admitted to the Union. Since defendant's evidence of non-navigability was strongly controverted, the court held that defendant had not acquired prescriptive rights in the property. (Hart-Florida)

CITY OF MERIDIAN V PEAVY (OBSTRUCTION OF FLOW IN CULVERT).
194 So 595-596 (Miss 1940).

Descriptors: *Mississippi, *Culverts, *Damages, *Adjudication procedure, Condemnation, Sewers, Storm runoff, Excess water (Soils), Floodwater, Rainfall disposition, Rainfall intensity, Water injury, Rainfall-runoff relationships, Flood damage, Overflow, Storm drains, Judicial decisions, Legal aspects, Cities, Impoundments, Obstruction to flow.

Plaintiff landowner sued defendant city for damages to realty and personality caused by water backing up over a plugged culvert. Defendant had installed a sewer pipe within the culvert, causing it to clog with sand and debris and impounding water which overflowed plaintiff's property. The overflowing water caused the pillars in plaintiff's residence to sink and destroyed his garden five times in one season. All contentions and evidence at the trial were based upon defendant's negligence in maintaining the culvert, but plaintiff obtained a jury instruction for the jury to find for plaintiff unless unprecedented rainfall caused the damage. The court found that this instruction pre-empted the issue of negligence, so that the jury's findings on the uncontroverted issue of rainfall would control the verdict. Plaintiff sought to sustain the instruction under a constitutional provision which entitled him to damages for inverse condemnation. In holding that the jury instruction was erroneous, the court reasoned that the defenses available for a condemnation action were entirely different from those for negligence, and held that plaintiff could not recover under a theory neither raised in the pleadings nor proved at the trial. CITY OF LAKELAND V DOUGLASS (MUNICIPALITY'S POLLUTION OF LAKE A NUISANCE).

197 So 467-470 (Fla 1940).

Descriptors: *Florida, *Water pollution, *Damages, *Municipal wastes, Adjudication procedure, Public health, Sewers, Sewage, Sewage disposal, Water pollution sources, Mosquitoes, Minnows, Water pollution effects, Pollutants, Fish kill, Odor, Carriers, Intermediate hosts, Judicial decisions, Legal aspects, Cities, Local gover

nents, Remedies, Lakes, Riparian rights, Riparian and.
dentifiers: *Nuisance.

Plaintiff littoral landowner brought action against defendant city for damages from pollution. Defendant turned raw city sewage into a canal which ran nto a lake upon which plaintiff's property bordered. The canal and lake were severely polluted, iving off noxious odors, destroying mosquito-larae eating minnows, and contaminating the lake. Plaintiff claimed loss of the use and enjoyment of is property and injury from malaria caused by the roliferation of mosquitoes. Defendant appealed he trial court's judgment for plaintiff. In affirming, he court found that the pollution was a nuisance or which the municipality was liable in damages. lowever, the court declared that plaintiff's laimed injury from loss of employment from alaria was too speculative to be allowed as a basis or damages from defendant. (Hart-Florida)
V71-00713

THE PAN-AM (OIL POLLUTION BY OIL TANKER IN COASTAL WATERS).

48 F2d 925-927 (3rd Cir 1945).

Descriptors: *Water pollution, *Legislation, Ships, *Damages, Water pollution sources, Pollutants, Oil, Navigable waters, Admiralty, Waves (Water), Ocean waves, Winds, Weather, Wind elocity, Judicial decisions, Legal aspects, Seepage, Oily water.
dentifiers: *Oil Pollution Act.

Plaintiff United States filed a libel against defendant oil tanker for discharge of oil in violation of he Oil Pollution Act. The vessel had discharged oil nto the coastal navigable waters of the United tates. Defendant answered that the vessel had encountered strong winds which strained the vessel nd caused the seepage, and therefore the oil eepage was unavoidable and caused by an emergency. The court found that no willingness or intent o discharge oil, nor overt act were required to impose liability under the Act; however, the Act was ound to excuse liability if seepage was a result of n emergency or unavoidable accident, collision or tranding. The evidence revealed that the weather nd sea conditions encountered were not severe, nd the vessel had received certificates of eaworthiness just prior to the voyage in question. Holding that the evidence did not support a finding f unavoidable accident under the Act, the court ffirmed the judgment for plaintiff. (Hart-Florida)

WISCONSIN PUB SERV CORP V FEDERAL POWER COMM'N (HYDROELECTRIC PROJECT LICENSING).

47 F2d 743-749 (7th Cir 1945).

Descriptors: *Wisconsin, *Navigable rivers, Hydroelectric project licensing, *Federal Power ct, Hydroelectric power, Hydroelectric plants, Navigation, Non-navigable waters, Lumbering, Interstate rivers, Judicial decisions, Legal aspects, Dams, Rivers, River regulation, Legislation, Administrative agencies, Administrative decisions, Supervisory control (Power), Permits.

Plaintiff corporation brought action against defendant commission to set aside defendant's order for laintiff to apply for a license under the Federal ower Act before operating a hydroelectric project n the Wisconsin River. Defendant contended that he Wisconsin River was navigable, and therefore laintiff was required to obtain a license to operate he project. Plaintiff contended the river was nonavigable because of obstruction. Defendant roved that the river was extensively used for transortation of logs in interstate commerce from 1858 o 1907. Plaintiff contended that use for logging nd rafting was insufficient for navigability. The ourt defined navigability in law as navigability in fact, noting that a river is navigable in fact when it is susceptible to use as a highway for commerce. The court stated further that: (1) log floating in continuous movement between states is interstate commerce; (2) absence of use over a long period becaused of changed conditions does not affect navigability; (3) once navigable, a waterway remains so; and (4) the ultimate finding of navigability is a factual question. On this basis the court concluded that the Wisconsin River was navigable. Plaintiff's further assertions that the logging operations were intrastate and that defendant's order ultra vires were rejected, and the court affirmed defendant's order. (Hart-Florida)
W71-00717

PENNSYLVANIA WATER AND POWER CO. V FEDERAL POWER COMM'N (HYDROELECTRIC PROJECT LICENSING).
123 F2d 155-163 (DC Cir 1941).

Descriptors: *Pennsylvania, *Navigable rivers, *Hydroelectric project licensing, *Federal Power Act, Hydroelectric power, Hydroelectric plants, Navigation, Non-navigable waters, Interstate rivers, Judicial decisions, Legal aspects, Dams, Rivers, River regulation, Legislation, Administrative agencies, Administrative decisions, Regulation, Permits, Supervisory control (Power).

Plaintiff power company brought action to set aside defendant commission's order to apply for a license to operate its hydroelectric project on the Susquehanna River. Plaintiff asserted that the river was non-navigable, but further asserted that if it was navigable, the dam was still lawful since it was erected with congressional consent prior to enactment of the Federal Power Act, which had only prospective application. In holding the Susquehanna to be navigable, the court stated that a river is navigable in law when it is navigable in fact, and when a river, with reasonable expenditure, may be made navigable, then it is navigable in fact. Finding that reasonable efforts would render the Susquehanna navigable, the court affirmed defendant's order. The court rejected plaintiff's contention that the dam was lawful notwithstanding navigability, noting that a congressional grant was not binding upon future Congresses, and that the language of the Federal Power Act indicated an intent to give it retrospective application. (Hart-Florida)
W71-00718

GOUAX V BOVAY (PAYMENT OF TOLL BY UNITED STATES FOR USE OF INTERSTATE TOLL BRIDGE).
105 F2d 256-259 (5th Cir 1939).

Descriptors: *Mississippi, *Louisiana, *Bridges, *Payment, Bridge construction, Cost sharing, Legislation, Rivers, Mississippi River, Navigable rivers, Highways, Federal government, United States, Legal aspects, Judicial decisions, Administrative agencies, Interstate.
Identifiers: *Constitutionality.

Plaintiff army officer sought repayment of tolls paid for movement of federal troops and vehicles across a Mississippi River bridge owned by defendant bridge company. Plaintiff contended that under the Bridge Act, no tolls were payable. Defendant asserted that the Bridge Act and cngresssional authorization expressly permitted tolls. The court noted that since the bridge was interstate, Congress might regulate the tolls. The erection of any bridge over navigable waters not lying wholly within one state requires congressional consent. However, the court found that where Congress had given no special aid to the enterprise, free use by the United States would not be assumed. After pointing out that where the United States had assisted construction of such bridges, immunity from tolls had often been expressly stipulated, the court concluded that immunity from toll for plaintiff would amount to taking property without conpensation, and affirmed the lower court's decision for defendant. HEGGLUND V UNITED STATES (CRIMINAL PROSECUTION FOR DISCHARGE OF OIL INTO NAVIGABLE WATERS).

100 F2d 68-71 (5th Cir 1938).

Descriptors: *Louisiana, *United States, *Oily water, *Water pollution, Path of pollutants, Pollution abatement, Pollutants, Water pollution sources, Oil wastes, Ships, Navigable waters, Leakage, Legislation, Remedies, Judicial decisions, Legal aspects, Oil, Oil industry.

Defendant was convicted of violating a federal statute which forbade the discharge of oil by a ship into coastal navigable waters of the United States. On appeal, he argued that the statute contemplated only an intentional discharge and that his action was unintentional and came within the statutory exception covering such discharges in cases of unavoidable accidents. The United States Circuit Court of Appeals, Fifth Circuit, ruled that the act was designed to cover unintentional as well as intentional discharge and that the fact that defendant knew his ship to be leaky was sufficient to take the case out of the unavoidable accident exception of the statute. The conviction was affirmed. (Barker-Florida)

LAKEWOOD SS CO V SUPERIOR WATER, LIGHT AND POWER CO (DAMAGE TO UNDERWATER WATER MAIN).
88 F2d 895-899 (7th Cir 1937).

Descriptors: *Wisconsin, *United States, *Damages, *Conduits, Metal pipes, Pipes, Water conveyance, Navigable waters, Bays, Legislation, Governments, Ships, Anchors, Pumping, Pumps, Pumping plants, Remedies, Judicial decisions, Legal aspects, Piping systems (Mechanical), Navigation.

Plaintiff operated a water main beneath the waters of a bay between Wisconsin and Minnesota. Defendant steamship company's ship dragged its anchor across the main, thus damaging the pipe. Plaintiff brought suit to recover the damages, contending that he was operating the water main properly, pursuant to federal statutes. Defendant argued that plaintiff had failed to obtain proper permission for his operations and that such activity by plaintiff was subject to the paramount right to full navigation in the bay. Affirming the trial court's ruling for plaintiff, the United States Circuit Court of Appeals, Seventh Circuit, ruled that plaintiff had secured sufficient authority from the government and that the water main was not an obstruction to navigation. (Barker-Florida)

JOHNSON V DRAKE (LIABILITY FOR FLOOD DAMAGE CAUSED BY BACKWATER).
142 SE 552-553 (Ga 1928).

Descriptors: *Georgia, *Dams, *Streams, *Flooding, Flood damage, Water injury, Backwater, Riparian land, Riparian waters, Riparian rights, Local governments, Cities, Highways, Public benefits, Legal aspects, Judicial decisions, Adjudication procedure, Cultivated lands.
Identifiers: *Dedications.

Plaintiff riparian owner sued to enjoin defendant riparian owner from maintaining a dam across a stream. Plaintiff also sought to recover damages to her crops resulting from flooding caused by the dam. Plaintiff contended that the dam was a continuing nuisance and that the flooding was a continuing trespass. Defendant contended that the dam was dedicated to public use, having been built originally by the city, and that the common grantor of plaintiff's and defendant's property had released defendant's predecessor from all liability in connection with the dam. The court found no error in the admission of defendant's evidence concerning the dedication and earlier release. The directed verdict for defendant was affirmed. (Liptak-Florida)

SOUTHERN RY V NEAL (RAILROAD'S LIABILITY FOR FLOODING CAUSED BY INADEQUATE CULVERT).

135 SE 703-706 (Va 1926).

Descriptors: *Virginia, *Historic flood, *Obstruction to flow, *Culverts, Floods, Flood damage, Maximum probable flood, Natural flow doctrine, Railroads, Judicial decisions, Legal aspects, Damages, Streams, Streamflow, Mills, Bridges, Bridge construction, Bridge design, Backwater.

Plaintiff mill owner brought an action against defendant railroad to recover for flood damage to plaintiff's mill. The damage was caused when defendant's culvert over a stream backed up flood waters onto plaintiff's land. Plaintiff contended that defendant was negligent in constructing a culvert insufficient to pass the natural flow of the stream. Defendant contended that the damage was caused by an unprecedented flood which defendant was under no duty to anticipate when designing its culvert. The court noted that, if similar floods had previously occurred in the area, defendant should anticipate such occasional unusual flood. A lower court judgment for plaintiff was affirmed. (Liptak-Florida)

CROMARTIE V STONE (LIABILITY FOR DEATH CAUSED BY IMPROPER MOORING IN NAVIGABLE RIVER).

194 NC 663, 140 SE 612-616 (1927).

Descriptors: *North Carolina, *Navigable rivers, *Boats, *Accidents, State jurisdiction, Federal jurisdiction, Dams, Rivers, Navigable waters, Locks, Channels, Admiralty, Damages, Legal aspects, Judicial decisions.

Plaintiff widow brought action against defendant barge company for the wrongful death of her husband. Plaintiff contended that defendant was negligent in mooring its boat and two barges in the calm part of a navigable river, thereby causing the husband's raft to veer into the swift part of the channel and go over a dam. Defendant contended that it was not negligent, that plaintiff's husband was contributorily negligent, and that the state court had no jurisdiction over an admiralty matter. In affirming a judgment for plaintiff, the court noted that navigable rivers were public highways which everyone had a right to use. Defendant was under a duty to use reasonable care to avoid injury to other boats and river craft. Moreover, a state may properly grant a remedy recognized by both common law and admiralty law. (Liptak-Florida)

PURSEL V POLSTER (LOWER RIPARIAN OWNER IS ESTOPPED FROM DENYING THE RIGHT TO DRAW WATER TO SUPPER RIPARIAN OWNER WHO HAD OBTAINED PREVIOUS PERMISSION FROM LOWER OWNER).
169 A 339-340 (NJ 1933).

Descriptors: *New Jersey, *Riparian rights, *Domestic water, *Water demand, Consumptive uses, Legal aspects, Judicial decisions, Streams, Springs, Competing uses, Relative rights, Prior appropriation, Water utilization, Diversion, Beneficial use, Potable water, Water allocation (Policy).

Plaintiff reparian owner sought to enjoin defendant landowner from continuing to draw water from plaintiff's stream and spring. While admitting that she had previously consented to defendant's use of some of the water, plaintiff contended that defendant was drawing water to such an extent that plaintiff's supply was severly diminished. Defendant contended that having acquired permission from plaintiff she was entitled to draw a reasonable amount as long as she did not interfere with plaintiff's supply. The New Jersey court held that plaintiff was estopped from denying defendant the right to take a resonable amount of water as long as plaintiff's supply was not unreasonably impaired. CHURCHILL V HARRIS (RIGHT TO ENTER LAND TO EXERCISE WATER RIGHTS).

257 Mass 499, 154 NE 87-88 (1926).

Descriptors: *Massachusetts, *Water rights, *Easments, *Right-of-way, Streams, Streamflow, Riparian land, Riparian waters, Riparian rights, Reasonable use, Judicial decisions, Legal aspects, Water law, Competing uses, Land tenure, Relative rights, Water supply, Real property.
Identifiers: Injunction (Restraining).

Plaintiff landowner sold land to defendant landowner, but reserved the right to use one half of a stream on the defendant's land for the use of plaintiff's adjoining property. Plaintiff sued to restrain defendant from interfering with the enjoyment of the reserved water rights. Defendant had refused to allow plaintiff onto the land to connect the pipes leading to plaintiff's land. Plaintiff contended that the reservation of the water rights necessarily implied the right to go onto the defendant's land to exercise those rights. Defendant contended that the reservation created no easement and that plaintiff should pay for such an easement. The court held that plaintiff not only had a valid appurtenant easement but also was a part owner of the land from which the spring flowed. The judgnent sustaining defendant's demmurer was reversed. (Liptak-Florida)

THURSTON V CARTER (BREACH OF CONTRACT TO KEEP TITLE DITCH OPEN).

155 NE 834-835 (Ind 1927).

Descriptors: *Indiana, *Tile drainage, *Obstruction to flow, *Claims (Contracts), Contracts, Ditches, Drains, Tiles, Drainage, Surface drainage, Surface water, Water rights, Legal aspects, Judicial decisions, Drainage effects, Damages, Drainage systems, Easements.

Plaintiff and defendant owned adjoining farms which were drained by a tile ditch. Plaintiff had agreed to rebuild the ditch if defendant would keep his portion of the ditch open and unobstructed. Plaintiff brought action against defendant for damages resulting from defendant's failure to keep the ditch open. Plaintiff contended that there was a valid, binding contract requiring defendant to keep the ditch open. Defendant argued that the contract simply gave plaintiff an easement across defendant's land and that it was plaintiff's duty to repair the ditch. Affirming a judgment for plaintiff, the court held that the contract was valid and that defendant, by refusing to perform, could not shift the duty of keeping the ditch open to plaintiff. (Liptak-Florida)

CHELTENHAM AND ABINGTON SEWERAGE CO V PUBLIC SERVICE COMM'N (DEDICATION OF SEWERAGE SYSTEM).
162 A 469-473 (Pa 1932).

Descriptors: *Pennsylvania, *Sewers, *Administrative agencies, *Rates, Clay pipes, Disposal, Drainage systems, Sewage disposal, Storm drains, Easements, Urbanization, Land tenure, State governments, Drainage, Water conveyance, Administrative decisions, Drainage programs.

Plaintiff sewerage company appealed an order of defendant public service commission abolishing plaintiff's charges for sewerage systems in two townships. The sewerage systems of the townships were installed by a promoter along with surface drainage improvements. The promoter formed plaintiff corporation, but did not convey his rights in the systems to plaintiff until after the sale of a number of lots in certain subdividions. The promoter's conveyances to the lot owners did not reserve any rights to the sewerage system. The charges for the storm sewers had been made for years. Defendant contended that these circumstances proclaimed the promoter's intent to dedicate the sewerage system to the public, and hence plaintiff did not own the system. Sustaining this contention, the court noted that the residents had a drainage easement wherever the promoter had installed drains in natural watercourses and held that plaintiff could not extract charges for the system. Plaintiff further contended that one of its employees cleaned the system after heavy rains three or four times per year, but the court held that this service did not justify compensation. Defendant's order was affirmed. (Hart-Florida)

ORK V GOLDER (EXISTENCE OF A RAINAGE EASEMENT OF NECESSITY).
1 A 558-559 (Me 1930).

escriptors: *Maine, *easements, *Adjudication ocedure, *Ditches, Culverts, Drainage, Drainage stems, Drainage practices, Judicial decisions, gal aspects, Relative rights.

Plaintiff landowner sued defendant landowner for damages which resulted from the obstruction of a drainage ditch on defendant's land. Plaintiff claimed an easement of necessity for drainage across defendant's lot. Defendant contended that since the ditch did not exist at the time of the trial, or exist at the time of his purchase, plaintiff had no easement. The court noted three requirements for plaintiff to have an easement of necessity: (1) there was an open drain; (2) its purpose was obvious; and (3) it was necessary for the reasonable enjoyment of plaintiff's lot. The court, reviewing the evidence, held that the jury below could properly have found that no ditch existed, and affirmed the lower court's decision for defendant. (Hart-Florida)

GODDARD V BERLIN MILLS CO (LIABILITY FOR FLOODING CAUSED BY BACKWATER FROM DAM).

131 A 601-606 (NH 1926).

Descriptors: *New Hampshire, *Dams, *Backwater, *Flood damage, Water injury, Rivers, Navigable rivers, Riparian land, Damages, Obstruction to flow, Milldams, Water levels, Lumbering, Legal aspects, Judicial decisions, Water rights, Prescriptive rights, Adjudication procedure.

Plaintiff landowner brought action against defendant mill and dam owner to recover damages caused by backwater from the dam and from logs defendant floated and stored on the river. Plaintiff contended that closing all of defendant's flashboards had raised the water level of the river and overflowed plaintiff's land five miles upriver. Plaintiff also alleged that defendant negligently ran logs on the river, thereby damaging defendant's bank. Defendant denied the overflow, asserted a prescriptive right to maintain its dam at its present height and claimed the right to drive logs on the river. The court noted that plaintiff commenced his action before the prescriptive 20-year period had expired and that the right to drive logs on the river was conditioned on the exercise of ordinary and reasonable care. The court found that the evidence, although inconclusive, was sufficient to justify the jury's verdict and the resulting judgment for plaintiff. (Liptak-Florida)

ALEXANDER V WABASH RY (LIABILITY FOR OBSTRUCTION OF SURFACE RUNOFF).
38 SW2d 545-550 (Mo 1931).

Descriptors: *Missouri, *Embankments, *Surface runoff, *Obstruction to flow, Damages, Judicial decisions, Legal aspects, Crops, Railroads, Beds, Drainage, Watercourses (Legal), Ditches, Discharge (Water), Laterals, Drains, Impoundments, Conduits, Flumes, Natural flow, Alteration of flow, Impounded waters, Water injury, Flood damage, Overlying proprietors, Surface waters.

Plaintiff brought suit against defendant railroad for damages to their crops. Defendant built an embankment upon their right-of-way. Plaintiff alleged that the embankment was negligently constructed and maintained in that it provided inadequate drainage for surface waters and excessive precipitation, thereby causing an increased flow of water over plaintiff's lands. Defendant contended that their drainage facilities were adequate and that plaintiff, as lower proprietor, was occupant of the servient estate over which excess waters could flow in their natural course. The court affirmed the trial court's dismissal of the action against defendant since there was no evidence of a material fact upon which relief could have been granted. (Barnett-Florida)

CHICAGO, ST LOUIS AND NEW ORLEANS RR V ADKINS (LIABILITY FOR OBSTRUCTION TO FLOW DUE TO INSUFFICIENT PASSAGE IN RAILROAD EMBANKMENT).
247 Ky 241, 56 SW2d 969-972 (1933).

Descriptors: *Kentucky, *Obstruction to flow, *Flooding, *Surface drainage, Excessive precipitation, Rain, Rainfall, Drainage, Ditches, Drainage systems, Drainage water, Flow, Barriers, Damages, Flood damage, Floods, Overflow, Backwater, Flood water, Judicial decisions, Railroads, Embankments, Legal aspects.

In an action for damages, plaintiffs contended that defendant railroad company caused water to be diverted upon their lands. Plaintiffs contended that defendant negligently constructed an embankment over a drainage system ditch in that the embankment left insufficient passageways for water to flow in the ditch. Plaintiffs contended that such obstruction resulted in waters being backed up and caused to overflow, resulting in plaintiffs' lands being flooded. Defendant contended that the flooding was caused by excessive rains and that the overflow of the ditch would have occurred notwithstanding the railroad embankment. The court ruled that the issue of whether or not the embankment caused the flooding was a question for the jury. The court held that there was sufficient evidence to uphold the jury's determination that the embankment left insufficient passage for the waters and was a proximate cause of the flooding. The court also approved the trial court's instruction that the amount of damages was measured by the diminution in market value caused by the overflow. (Snow-Florida)

FUNKE V ST LOUIS - SAN FRANCISCO RY (LIABILITY FOR DISCHARGE OF SURFACE WATER COLLECTED IN DITCH.
35 SW2d 977-982 (Mo 1931).

Descriptors: *Missouri, *Flood damage, *Surface drainage, *Adjudication procedure, Surface runoff, Drainage water, Overland flow, Repulsion (Legal aspects), Riddance (Legal aspects), Railroads, Legal aspects, Judicial decisions, Ditches.

Plaintiff landowner sued defendant railroad company for damages which resulted from the diversion of surface water onto plaintiff's land. Plaintiff contended that defendant had collected the water in a ditch and discharged it onto his land. Defendant contended that the lower court erred in failing to sustain his demurrer at the close of plaintiff's evidence. The court noted that any landowner could rid his property of surface water so long as it was not collected and discharged to his neighbor's injury. The court held that the lower court had properly determined that the question of whether defendant had collected the water was for the jury. The lower court's judgment for plaintiff was affirmed. CHESAPEAKE AND O RY V CLIFTON (LIABILITY FOR FLOODING CAUSED BY OBSTRUCTION OF CULVERT UNDER RAILROAD).
237 Ky, 519, 35 SW2d 884-886 (1931).

Descriptors: *Kentucky, *Flooding, *Wells, *Damages, Shallow wells, Seepage, Underseepage, Water pollution, Water pollution effects, Water pollution sources, Streams, Rivers, Streambeds, Obstruction to flow, Overflow, Flood damage, Compensation, Culverts, Judicial decisions, Legal aspects, Adjudication procedure, Railroads.

Plaintiff riparian landowner sued defendant railroad for damages which resulted from the flooding of his property. Defendant owned a right-of-way adjacent to plaintiff's land. Defendant built its railroad over a stream, placing a culvert in the streambed. The culvert clogged with debris, backing up the stream onto plaintiff's land. Plaintiff asserted the flooding injured his property and polluted his well. The court determined that the lower court had erred in allowing damages in the diminution in property value, and stated that the proper measure of damages was the diminution in rental value, since the injury was temporary. The damages for injury to the land were held to be excessive. Furthermore, since a river had recently flooded plaintiff's well, and the culvert overflow had not flooded the well but could only have caused the pollution by seepage, the evidence was held insufficient to establish that the culvert overflow was the proximate cause of plaintiff's well pollution. The case was reversed and remanded for a new trial. (Hart-Florida)

CAVITT V FOWLER (OWNER MAY CONSTRUCT DAM AND DITCH ON OWN LAND TO RECLAIM LAND).
285 SW 175-178 (Mo 1926).

Descriptors: *Missouri, *Land reclamation, *Land development, *Wetlands, Swamps, Drainage, Drainage practices, Land management, Dams, Dam construction, Earth dams, Diversion structures, Flow control, Flood control, Levees, Ditches, Rivers, River flow, Ponds, Channels, Conveyance structures, Water rights, Riparian rights, Water conveyance, Judicial decisions, Legal aspects.

Due to a drainage district's dredging and straightening of a river channel upstream from plaintiff's and defendant's lands, the flow of such river through defendant's land was increased. In order to protect his lowlands from overflow, defendant constructed a dam and ditch to straighten the river channel on his land. Defendant conveyed the water from the dam into a pond which emptied into the river on the downstream section of his land. Plaintiff, who owned adjoining land downstream from defendant, brought an action to recover damages which resulted to his land and crops. Plaintiff alleged that defendant wrongfully constructed and maintained the dam and ditch which caused the river flow to flood plaintiff's land. The St. Louis Court of Appeals affirmed the lower court's judgment for defendant. The court held that defendant, as owner of land made swampy by the straightened condition of the river, had the right to construct the dam or ditch and empty excess water into the river which ran through this property for purposes of reclaiming and improving his land. (Powell-Florida)

TIDE WATER OIL SALES CORP V SHIMELMAN (LIABILITY FOR INTERFERENCE WITH DRAINAGE OF SURFACE WATER).
158 A 229-231 (Conn 1932).

Descriptors: *Connecticut, *Surface drainage, *Surface runoff, *Obstruction to flow, Overland flow, Surface waters, Drains, Water spreading, Legal aspects, Judicial decisions, Watersheds (Divides), Natural flow, Water rights, Alteration of flow, Reasonable use, Relative rights, Watercourses (Legal).

Plaintiff and defendant owned adjoining tracts of land. Plaintiff's land was drained of surface water by means of a natural depression which ran across defendant's property. During construction of improvements upon his premises, defendant filled in the depression. This resulted in an accumulation of water on plaintiff's land which previously would have flowed through the depression. Plaintiff brought an action for damages and an injunction, alleging the right as an owner of lands from which surface water flows to relief against an obstruction of that flow. The Superior Court of Errors of Connecticut, in affirming the lower court decision held that where the drainway was not well defined, plaintiff was not entitled to prevent defendant's interference with the drainage of surface water over his land. The court reasoned that a land-owner cannot prevent interference with drainage of surface water over adjacent land unless a servitude is impressed upon the property. The court held, however, that plaintiff was entitled to enjoin defendant from discharging surface water in increased volume onto plaintiff's land. (Powell-Florida)

MISSOURI PAC RR V NICHOLS (RAILROAD FAILING TO PROVIDE OPENINGS IN EMBANKMENTS LIABLE FOR FLOODING LANDS).
279 SW 354-357 (Ark 1926).

Descriptors: *Arkansas, *Embankments, *Railroads, *Floods, Judicial decisions, Legal aspects, Engineering structures, Road banks, Riparian rights, Riparian land, Riparian water, Watercourses (Legal), Streams, Overflow, Overland flow, Rain water, Rain, Surface waters, Surface runoff, Excessive precipitation.

The roadbed of defendant railroad crossed a creek adjacent to plaintiff's land. The creek had been straightened and was used as a drainage ditch. A 120-foot opening in the railroad embankment through which creek waters flowed was reduced by defendant to a 4-foot concrete box. During a rainfall water backed up onto plaintiff's land, thereby destroying his crops. Plaintiff brought an action for damages, alleging that the lack of a sufficient opening in defendant's roadbed caused such damages. Defendant presented evidence indicating the sufficiency of the opening. The Supreme Court of Arkansas affirmed the trial court's judgment for plaintiff, holding that the evidence presented supported plaintiff's verdict. The court stated that if defendant failed to provide openings so as not to flood plaintiff's land either at ordinary water stage or during floods which could reasonably have been foreseen, it was liable. The court determined that defendant's duty to provide a water outlet was continuous. Also, defendant should have provided an outlet, not merely for water falling within the banks of the stream crossed, but for all water which customarily flowed into the stream from the surface of the adjacent land. (Powell-Florida)

LUTESVILLE SAND AND GRAVEL CO V MCLAUGHLIN (OWNERSHIP OF SANDBAR IN NAVIGABLE STREAM).
26 SW2d 892-895 (Ark 1930).

Descriptors: *Arkansas, *Navigable waters, *Ownership of beds, *Sand bars, Gravels, Damages, Remedies, Judicial decisions, Legal aspects, Tidal waters, Riparian rights, Riparian land, High water mark, Beds under water, Public rights, Permits, Federal government, Bridges, Meanders, Navigable rivers, Boundary disputes, Land tenure, Accretion (Legal aspects).

Plaintiff brought suit against defendant gravel company to recover the value of gravel allegedly taken from her land. The gravel was removed from a sand bar, opposite plaintiff's land, which plaintiff alleged was an accretion to her land. Defendant alleged that the bar was not an accretion to plaintiff's land but, being situate in the bed of a navigable river, was public domain. The central issue for determination was whether or not the stream was navigable. The Supreme Court of Arkansas stated that a riparian owner on a non-navigable stream takes title to the center of the stream ratably with other riparian owners, his extent of interest being dependent on the frontage of his land upon the stream. However, a riparian owner on a navigable stream takes only to the high water mark. Evidence adduced at trial was sufficient to show the stream was navigable and as such, precluded plaintiff's recovery. (Barnett-Florida)

COZY LAKE, INC V NYODA GIRL'S CAMP INC (RIPARIAN RIGHT TO NATURAL FLOW OF A STREAM).
128 A 149-150 (NJ 1925).

Descriptors: *New Jersey, *Dams, *Natural flow, *Riparian rights, Spillways, Streams, Channels, Streamflow, Flow, Regulated flow, Alteration of flow, Obstruction to flow, Judicial decisions, Natural flow doctrine, Riparian land, Riparian waters, Reasonable use.

In an action for an injunction, plaintiff, a lower riparian owner, contended that it was being deprived of the natural flow of water from a stream. Plaintiff contended that defendant, an upper riparian owner, had constructed a dam with insufficient spillways which resulted in the retardation of the flow of the stream. Defendant contended that the dam did not materially alter the flow of the stream. The court held that an upper riparian owner may use the water of a stream in a reasonable manner so long as he does not destroy, render useless or diminish the flow of the stream to a lower riparian. The court ruled that there was no evidence to support the claim that any water had been materially diverted from its usual channel or that the flow of the stream had been diminished by the dam. Consequently, plaintiff's bill for an injunction was dismissed. (Snow-Florida)
W71-00977

HENDRIX V MCEACHERN (LIABILITY FOR OBSTRUCTION OF NATURAL DRAINAGE OF UPPER LAND).
139 SE 9-11 (Ga 1927).

Descriptors: *Georgia, *Surface drainage, *Diversion, *Obstruction to flow, Discharge (Water), Natural flow, Surface water, Surface runoff, Drainage, Dams, Boundary disputes, Watercourses (Legal), Land, Land tenure, Damages, Legal aspects, Judicial decisions, Backwater, Reasonable use, Relative rights.

Plaintiff upper landowner brought action against defendant lower landowner to recover a strip of land allegedly taken by defendant and to recover damages which resulted from the construction of the strip of a wall which interfered with the natural drainage of plaintiff's land. Defendant contended that plaintiff had erected a garage on her land which interfered with the natural flow of water and caused it to be discharged at a different place on defendant's land and in a greater quantity than would normally occur. The trial court found for defedant, and the Supreme Court of Georgia affirmed. It is a settled rule that a lower landowner owes a servitude to an upper landowner to receive the water which naturally runs from it, provided the upper owner has not acted to increase the flow of such water by artificial means. The court found that plaintiff had so altered the natural flow of water, and under such circumstances defendant could protect the drainage of his own land. (D... Florida)

L BALSO HOLDING CORP V MCKENZIE WNERSHIP OF UPLAND AND RIPARIAN GHTS).
Misc 498, NYS2d 790-796 (1937).

scriptors: *New York, *Riparian rights, *Ad-nistrative agencies, *High water mark, Low ter mark, Judicial decisions, Legal aspects, deral government, Riparian waters, Shores, ds, Streams, Navigable waters, Construction, rs, Cities, Boundaries, Tides, Channels, eather patterns, Windtides, Winds, Topography, ps, Land tenure, Real property.

itioner corporation sought an order of man-mus compelling the New York dock commis-ner to permit petitioner to construct a pier on a ek. Petitioner alleged ownership of upland be-d the point where the pier was to be erected, reby giving petitioner riparian rights and the vilege of constructing a pier. The city opposed itioner's claim by alleging the existence of a high ter mark of the creek inshore of the boundaries the upland claimed by petitioner. If such were e case, petitioner would have no rights in the land in question since the city was vested with ownership of land between the high and low water marks. Petitioner relied upon the dock department's prior use of a high water mark for many years which gave petitioner title to some upland. The city sought to establish a new high water mark, utilizing various findings of the federal government. The court found these new findings inconsistent in themselves and a departure from the city's own prior practices. The court held that petitioner had shown unequivocal title to the land in question, and under the accepted high water mark, was definitely the owner of some upland. Consequently, petitioner had the right to construct a pier. (Duss-Florida)

PLACE V UNION TOWNSHIP (MUNICIPAL LIABILITY FOR ALTERATION OF NATURAL DRAINAGE).
66 SW2d 584-591 (Mo 1934).

Descriptors: *Missouri, *Drainage, *Obstruction to flow, *Dams, Repulsion (Legal aspects), Overflow, Roads, Rivers, Levees, Floods, Legal aspects, Diversion, Alteration of flow, Surface waters, Natural streams, Watercourses (Legal), Surface runoff, Flood damage, Relative rights, Remedies, Flood plains, Natural flow, Drainage practices, Ditches.

Plaintiffs sought to force defendant township to rebuild several dams across a road ditch. It was alleged that the road and ditch cut across several ridges which had acted as natural levees protecting plaintiffs' property from floodwaters from a nearby river and from surface runoff. Defendant urged that any overflow resulted from surface waters, which under the 'common enemy rule' each landowner must repel as best he can, and therefore that removal of the dams had resulted in no legal injury to plaintiffs. The court rejected this contention, finding that the sloughs between the ridges were natural waterways. This being so, any diversion of the natural flow of such waterways gave rise to an actionable wrong to those injured thereby. The court found that construction of the road and ditch diverted floodwaters from their natural paths in the sloughs onto plaintiffs' property, and affirmed the trial court's judgment requiring defendant to rebuild the dams in question to prevent flood damage to plaintiffs. (Caldwell-Florida)

MOBILE AND O RR V TAYS (LIABILITY FOR ALTERATION OF SURFACE WATER FLOW BY CONSTRUCTION OF RAILROAD EMBANKMENT).
107 So 871-874 (Miss 1926).

Descriptors: *Mississippi, *Railroads, *Alteration of flow, *Flood damage, Bridges, Obstruction to flow, Natural streams, Diversion, Overflow, Structures, Legal aspects, Embankments, Natural flow, Streams, Surface waters, Surface runoff, Repulsion (Legal aspects), Relative rights, Judicial decisions, Construction, Culverts, Floods.

Defendant railroad had started to replace a trestle with an embankment. Plaintiff sought to enjoin this action, claiming that the embankment would divert surface runoff onto his property, thereby causing flood damage. The court denied the injunction, stating that plaintiff had failed to allege that the trestle was cheaper, safer and more convenient than the embankment. The court held that the duty imposed by law on railroads to provide suitable and safe roadways carried with it the right to construct embankments to support those roadways when necessary. When this right was exercised with due regard to the rights of adjacent landowners, any necessary injury resulting from the embankment must be borne by the owner. Plaintiff, by failing to allege that the trestle was cheaper, safer and more convenient, had failed to show sufficient injury to his property to allow an injunction to issue. (Caldwell-Florida)

TILDEN V SMITH (RIPARIAN OWNER MAY LOWER LAKE TO ORDINARY HIGH WATER MARK).
113 So 708-712 (Fla 1927).

Descriptors: *Florida, *High water mark, *Drainage wells, *Floodwater, Legal aspects, Judicial decisions, Remedies, Lakes, Water levels, Riparian rights, Riparian land, Riparian water, Floods, State governments, Legislation, Rainfalls, Weather, Banks, Vegetation, Water level fluctuations, Agriculture, Golf courses.

Plaintiffs sought to enjoin defendant from lowering the level of Lake Johns by drilling a deep well to let water drain underground. Defendant contented that the water level in the lake was excessively high because of abnormal rainfall and that his golf course, as well as property of other riparian owners, was flooded. Plaintiffs insisted that, if the level were lowered, they would receive less frost protection for their crops in dry years. The Supreme Court of Florida affirmed a lower court opinion denying the injunction. The court held that the state statute allowing an injuction against lowering of lake levels applied only to the ordinary high water mark, not the highest level the water reached. The court found sufficient evidence from vegetation and trees to establish that the ordinary high water mark was lower than the level at the time of plaintiff's suite. (Morris-Florida)

MAGINNIS LAND AND IMPROVEMENT CO V MARCELLO (OWNERSHIP OF BATTURE LANDS).
168 La 997, 123 So 653-655 (1929).

Descriptors: *Louisiana, *Accretion (Legal aspects), *Boundary disputes, *Bayous, Beds, Boundaries (Property), Prescriptive rights, Land tenure, Real property, Riparian land, Riparian waters, Riparian rights, Dry beds, Legal aspects, Judicial decisions, Maps, High water mark.

Plaintiff landowner sued ten defendant landowners to quiet title to batture property which was in defendants' possession. Plaintiff had sold lots to defendants but contended that the batture property was not included in the sale according to the recorded map of the property. Defendants contended that their deeds conveyed the land up to the water and that the batture property was theirs by right of accretion. Affirming a judgment for plaintiff, the court held that defendants' property boundaries were controlled by the recorded map where the deeds were in conflict with the map, and that the only evidence showed that the batture existed before plaintiff sold the lots to defendants. Therefore, the batture land was plaintiff's by right of accretion and was not included in the sale of the lots to defendants. (Liptak-Florida)
W71-00988

SMITH V MCELDERRY (RIPARIAN OWNER'S LIABILITY FOR DIVERSION AND ALTERATION OF NATURAL FLOW OF STREAM).
124 So 896-97 (Ala 1929).

Descriptors: *Alabama, *Diversion, *Natural flow doctrine, *Riparian rights, Obstruction to flow, Alteration of flow, Reasonable use, Streamflow, Riparian land, Riparian waters, Ditches, Legal aspects, Judicial decisions, Prescriptive rights, Remedies, Relative rights, Streams, Diversion structures.

Plaintiff riparian owners sued to restrain defendant riparian owner from diverting water from the stream separating their property. Plaintiffs contended that they were entitled to the natural flow of the stream and that defendant, by diverting water into a ditch which later emptied back into the stream, had reduced the stream flow so that the channel had become clogged with logs and debris and was therefore useless. Defendant argued that he had a prescriptive right to maintain the ditch, since it had been dug 25 to 40 years before he had

acquired the property, and also contended that he was under a duty only to maintain the streamflow as it existed when he purchased the property. Affirming a judgment for defendant, the court held that defendant had acquired a prescriptive right, particularly since plaintiffs had dug a similar ditch on their own property, and that defendant now had no right to materially alter the flow of the stream. (Liptak-Florida)
W71-00989

GREENFIELD V POWELL (TITLE DISPUTE TO LAND FORMED BY AVULSION).
127 So 171-173 (Ala 1930).

Descriptors: *Boundary disputes, *Avulsion, *Accretion (Legal aspects), *Alabama, Bank erosion, Stream erosion, Channels, Streams, Boundaries (Property), Legal aspects, Judicial decisions, Prescriptive rights, Remedies, Erosion, Riparian land, Riparian rights, Riparian waters, Real property, Land tenure, Sands, Gravels.

Plaintiff riparian owner brought action in ejectment against defendant riparian owner and also sought to recover damages for conversion of sand and gravel that defendant claimed by accretion. Plaintiff contended that the stream separating the lands in question had suddenly changed course because of a freshet which eroded plaintiff's banks and enlarged defendant's bank, that this action was due to avulsion, and, therefore, that defendant had no right to the newly formed land. Defendant contended that the land was formed by accretion, was therefore his, and that the sand and gravel deposited on his bank was not the same as that washed away from plaintiff's bank. Affirming a judgment for plaintiff, the court held that the evidence clearly showed a sudden and distinct change in the stream's channel. Such could only result from avulsion, and the new land formed on one side of the stream need not be the same that washed away from the other side. (Liptak-Florida)
W71-00990

WINEMAN V WITHERS (BOUNDARY DISPUTE OVER LAND FORMED IN NON-NAVIGABLE RIVER BY ACCRETION).
108 So 708-709 (Miss 1926).

Descriptors: *Mississippi, *Accretion (Legal aspects), *Boundary disputes, *Ownership of beds, Rivers, Non-navigable waters, Streams, Stream erosion, Boundaries (Property), Channel erosion, Bank erosion, Riparian Land, Riparian waters, Legal aspects, Judicial decisions, River beds, Real property, Running waters, Remedies, Erosion, Beds under water.

Plaintiff riparian owner sued defendant riparian owner to quiet title to land formed by accretion in front of their adjoining property. Prior to this accretion, the river bed had encroached on both parties' lands. Plaintiff contended that the boundary line should be drawn at a right angle to the thread of the stream from a point where the original property line intersected the river bed where it had encroached onto the property before the process of accretion began. Defendant contended that the line should be drawn at a right angle to the thread of the stream from a point where the boundary intersected the river bed at its original location before the encroachment and recession of the river. Affirming a judgment for defendant, the court held that upland owners on non-navigable rivers own the bed of such rivers to the middle of the stream, and therefore the encroachment and recession of the river in the instant case did not change the original boundary of the property which already belonged to the upland owners. The court also held that the boundary of the accreted land was properly drawn from the property line at the river bed's original location. (Liptak-Florida)

JAMES V HAMM (LIABILITY FOR FLOOD DAMAGE CAUSED BY CONSTRUCTION OF DITCHES).
1 SW2d 552-553 (Ark 1928).

Descriptors: *Arkansas, *Drainage practices, *Ditches, *Flood damage, Relative rights, Drainage, Streams, Overflow, Surveys, Floods, Levees, Damages, Alteration of flow, Obstruction to flow, Legal aspects, Surface runoff, Judicial decisions, Surface waters.

Defendant constructed a drainage ditch across his property. Plaintiff brought action for damages, claiming that the dirt from the excavation of this ditch formed a levee which caused water to overflow onto plaintiff's adjacent property. Defendant contended that plaintiff had wrongfully constructed several drainage ditches which resulted in channelling an increased amount of surface runoff toward defendant's ditch. Defendant alleged that, but for plaintiff's ditches, his ditch would have been adequate to take care of all the water flowing toward it from plaintiff's property. The court held that it was plaintiff's ditches rather than the levee which resulted in the damage. A lower court decision for defendant was affirmed. (Caldwell-Florida)
W71-00992

SMITH V CITY OF KUTTAWA (TITLE TO LAKE AND PARK).
222 Ky 569, 1 SW2d 979-985 (1928).

Descriptors: *Kentucky, *Lakes, *Cities, *Land tenure, Relative rights, Public benefits, Real property, Parks, Land use, Recreation, Easements, Legal aspects, Water rights, Maps, Judicial decisions.

Plaintiff sought to assert his title to a large tract of land as against defendant city. The land in question included a lake and areas that were being used as parks. Defendant argued that plaintiff's predecessor in title had granted an easement to the city and its citizens to use the lake for recreational and other purposes. Defendant further claimed that it had the fee simple title to the lake and park, basing its claim on an adverse possession and dedication. The court held that even though defendant's easement was never recorded, the use of the lake was so open and notorious that plaintiff took the land with notice of defendant's rights. The court also held, however, that defendant's rights had not ripened into a fee simple title, but that it merely retained an easement. Plaintiff was therefore declared to own the property in fee simple, subject to defendant's easement. (Caldwell-Florida)
W71-00993

WHITE CONST CO V BROOKS (LIABILITY FOR OBSTRUCTION OF STREAM ALLEGED TO HAVE CAUSED FLOOD DAMAGE).
222 Ky 621, 1 SW2d 1076-1079 (1928).

Descriptors: *Kentucky, *Obstruction to flow, *Flood damage, *Damages, Alteration of flow, Construction, Barriers, Diversion, Streams, Relative rights, Streamflow, Legal aspects, Adjudication procedure, Floods, Real property, Overflow, Excessive precipitation, Bridges, Judicial decisions.

Plaintiff landowner brought action against defendant corporation for damages, alleging that defendant had wrongfully torn down a bridge over a stream and filled in the stream with rock, thus causing plaintiff's land to be flooded. The court held that the testimony of a witness for defendant that the cause of plaintiff's flood damage was an extraordinary rainfall rather than the obstruction of the stream was wrongfully excluded. The court also held that in view of all the surrounding circumstances, including the fact that plaintiff had not requested removal of the obstruction until after the flood, an award of punitive damages was erroneous. The lower court's decision for plaintiff was reversed. (Caldwell-Florida)
W71-00994

FRAZIER V LOUISVILLE AND N RR (LIABILITY FOR FLOOD DAMAGES FROM EXTRAORDINARY RAINFALL).
231 Ky 107, 21 Sw2d 140-142 (1929).

Descriptors: *Kentucky, *Culverts, *Railroads, *Flood damage, Obstruction to flow, Surface runoff, Structures, Embankments, Excessive precipitation, Maximum probable flood, Surface waters, Drainage, Damages, Floods, Legal aspects, Relative rights, Overflow, Judicial decisions.

Plaintiff landowner brought action against defendant railroad to recover damages for injuries to this property. A flood in May 1927 left a culvert under a railroad embankment near plaintiff's house clogged with debris. Plaintiff claimed that defendant had negligently failed to clean out this debris which resulted in floodwaters backing up and damaging his house during a subsequent flood in July. The court held that defendant was only under an ordinary duty of care to avoid flood damage to plaintiff. The July flood was found to have been extraordinary and beyond anything that might reasonably have been anticipated. The court found that defendant had in fact cleaned out the culvert sufficiently to take care of any runoff that might ordinarily have been expected. The court held, therefore, that the unforseeable floods and not defendant's negligence had been responsible for the damage to plaintiff's house. The fact that plaintiff himself had done nothing to clear the culvert also weighed against him. (Caldwell-Florida)
W71-00995

CHESAPEAKE AND O RY V WEDDINGTON (LIABILITY FOR DAMAGES RESULTING FROM OVERFLOW OF CREEK).
231 Ky 745, 22 SW2d 131-133 (1929).

Descriptors: *Kentucky, *Railroads, *Landslides *Overflow, Alteration of flow, Diversion, Obstruction to flow, Legal aspects, Right-of-way, Damages Erosion, Relative rights, Streams, Flood damage Real property, Channel flow, Judicial decisions Floods.

Plaintiff landowner brought action against defendant railroad for damages which resulted to his land when an unusually large quantity of dirt and stones which defendant had piled upon its right-of-way slid of its own weight into an adjacent creek forcing the creek waters to flow over plaintiff's property. Defendant contended that it had merely made use of its own land without negligence, and damage to adjacent landowners from such use being non-compensable. The court held that the unusual size of the pile, and the fact that it had slipped of its own weight into the creek, made the resulting injury a wrongful one. Since the injury was not of a class of incidental damages, unavoidable in the course of railroad operation, plaintiff could recover. The amount of the verdict for plaintiff was held to be excessive, however, and the case was remanded for a proper determination of damages. (Caldwell-Florida)

escriptors: *New York, *Cities, *Water districts, Water supply, Project planning, Water policy, ate governments, Local governments, Lakes servoirs, Municipal water, Legislation, Adminis-tive decisions, Judicial decisions, Legal aspects.

aintiff taxpayer brought suit against defendant wn supervisor to prevent issuance of bonds to ance the establishment of a water district. The wn had adopted a plan whereby a lake which was thin a state-owned forest preserve would be used a water supply for the water district. The boun-ries of the town and the water district were entical. Permission for the establishment of the strict had been granted by the State of New York, d plaintiff's challenge to the plan was dismissed the trial and appellate courts. The Court of Ap-als of New York reversed the lower decisions, lding that the state laws and constitution allowed r use of state-owned water only as a water supply r municipalities. A water district, as created in is case, did not come within the definition of 'mu-cipalities' contemplated by such laws. Judgment r plaintiff was granted and the plan held invalid. arker-Florida)

HITLING V TYLER (EQUITABLE RELIEF ROM OBSTRUCTION TO FLOW).
21 Ohio St 125, 167 NE 365-366 (1929).

Descriptors: *Ohio, *Remedies, *Obstruction to flow, *Backwater, Barriers, Watercourses (Legal), Damages, Flooding, Dams, Adjudication procedure, Judicial decisions, Legal aspects.
Identifiers: Injunctions (Prohibitory).

Plaintiff brought an action for damages and an injunction against defendant's obstruction of two watercourses which resulted in water backing up on plaintiff's property. Defendant denied the allegations, but the trial court granted plaintiff an injunction. The Supreme Court of Ohio, reversing for procedural errors, ruled that equitable relief to restrain obstructions to flow is not barred even though there may be an adequate remedy at law. (Barker-Florida)
W71-01001

MCKIERNANN V GRIMM (OBSTRUCTION OF NATURAL WATERCOURSE).

165 NE 310-311 (Ohio 1928).

Descriptors: *Ohio, *Obstruction to flow, *Alteration of flow, *Diversion, Natural flow, Natural flow doctrine, Barriers, Buildings, Relative rights, Boundaries (Property), Watercourses (Legal), Intermittent streams, Damages, Remedies, Judicial decisions, Legal aspects.

Plaintiff landowner sought an injunction against defendant neighboring landowner for the wrongful obstruction of a natural watercourse. Defendant had constructed a garage on his property and in so doing had obstructed the watercourse and caused the water to be diverted onto plaintiff's land. The trial court granted the injunction. In affirming, the appellate court ruled that proof of obstruction of a natural watercourse was sufficient for injunction. The court further ruled that the general rule of dominant and servient tenements does not apply when a servitude is created artificially. (Barker-Florida)
W71-01002

SICILIANO V BARBUTO (DISCHARGE OF COLLECTED WATER).
265 Mass 390, 164 NE 467-469 (1929).

Descriptors: *Massachusetts, *Snow, *Rain, *Buildings, Roofs, Precipitation (Atmospheric), Water, Damages, Drains, Flow, Remedies, Judicial decisions, Legal aspects, Discharge (Water).

Plaintiff landowner brought an action for injunction and damages against defendant neighboring landowner for the wrongful collection and discharge of water onto plaintiff's land. The trial court found that defendant maintained buildings whose eaves and drain troughs discharged water from rain and snow onto plaintiff's land. On appeal, the Supreme Judicial Court of Massachusetts held that such action was indeed tortious and affirmed the judgment for plaintiff. (Barker-Florida)
W71-01003

UNITED PAPER BOARD CO V IROQUOIS PULP AND PAPER CO (FLASHBOARDS WITHIN MEANING OF CREST OF A DAM).
164 NE 594-595 (NY 1928).

Descriptors: *New York, *Dams, *Floodgates, *Spillway crests, Adjudication procedure, Flow, Flow control, Judicial decisions, Legal aspects.
Identifiers: *Flashboards.

In a per curiam decision wherein the facts were not presented, the Court of Appeal of New York ruled that when a deed to water rights includes a provision that water shall flow over the crest of a dam, the top flashboards of the dam are to be considered as the crest of the dam. (Barker-Florida)
W71-01004

NANCE V MERCHANTS' FERTILIZER PHOSPHATE CO (LIABILITY FOR NEGLIGENCE IN POLLUTING A STREAM).

200 NC 702, 158 SE 486-490 (1931).

Descriptors: *North Carolina, *Water pollution, *Water pollution effects, *Water pollution sources, Judicial decisions, Adjudication procedure, Legal aspects, Streams, Surface waters, Damages, Remedies, Industrial wastes, Poisons, Toxins, Mortality, Fertilizers, Agricultural chemicals, Agriculture, Livestock, Animals, Domestic animals, Hogs, Stock water.

Defendant company's fertilizer plant discharged noxious chemicals into a stream near where plaintiff kept his hogs. During a period of heavy rainfall, the stream overflowed, depositing noxious substances in plaintiff's pasture. On two occasions a number of plaintiff's hogs died after consuming the polluted water. Plaintiff sought damages for defendant's allegedly negligent discharge of such chemicals. The trial court awarded plaintiff damages. Defendant contended on appeal that the deaths resulted from an act of God for which defendant was not liable. Defendant contended that the rainfall preceding the deaths was unprecedented. The Supreme Court of North Carolina affirmed. When negligence concurs with an act of God in producing an injury, the party guilty of such negligence shall be held liable for the consequences if the injury would not have occurred but for his failure to exercise due care. Defendant was obliged to use its property with care and was liable for the consequences of its negligence. (Dye-Florida)
W71-01005

HOLTON V NORTHWESTERN OIL CO (SURFACE WATER DRAINAGE AS NUISANCE).
201 NC 744, 161 SE 391-394 (1931).

Descriptors: *North Carolina, *Surface drainage, *Drainage, *Surface runoff, Adjudication procedure, Judicial decisions, Legal aspects, Damages, Runoff, Drainage water, Grading, Flow, Surface waters, Relative rights, Ditches, Drainage effects, Effects, Overlying proprietor, Remedies.

Defendant operated a service station on high ground adjacent to plaintiff's property and dwelling house. Water from defendant's ice box and water barrel drained into a ditch, which became filled with pop bottles, and overflowed onto plaintiff's property. Plaintiff sought damages and abatement of the drainage as a nuisance. The Supreme Court of North Carolina affirmed the trial court's judgment of non-suit. The court stated that the owner of lower land is obliged to receive surface water which falls on higher land and naturally flows onto lower land. (Dye-Florida)
W71-01006

COLLIER V GARNER (EQUITABLE RELIEF IN BOUNDARY DISPUTES).
170 SE 353-354 (Ga 1933).

Descriptors: *Georgia, *Boundary disputes, *Ownership of beds, *Remedies, Adjudication procedure, Legal aspects, Judicial decisions, Land, Real property, Streams, Streambeds, Beds, Banks, Land tenure, Bed under water, Boundaries (Property).

Defendant landowner owned property containing a creek. Defendant granted part of the land extending to one side of the creek to plaintiff's predecessor in title. When plaintiff attempted to remove rocks from his side of the stream, defendant interfered with the removal, claiming title to the entire stream. Plaintiff sued in equity to quiet title in the property to the thread of the stream. The trial court overruled defendant's demurrer, relying on a construction of the deed to plaintiff's predecessor giving plaintiff title to the thread of the stream. The Supreme Court of Georgia reversed. Adequate remedy was available to plaintiff through an action

at law in ejectment. The court stated that a court of equity will not quiet title where an adequate remedy exists at law. Plaintiff's complaint thus failed to state a cause of action, and defendant's demurrer should have been sustained. (Dye-Florida)
W71-01007

CHESAPEAKE AND O RY V CALDWELL (LIABILITY FOR DAMAGES RESULTING FROM INSUFFICIENT DRAINAGE THROUGH RAILWAY EMBANKMENT).
213 Ky 410, 281 SW 176-178 (1926).

Descriptors: *Kentucky, *Drainage, *Obstruction to flow, *Railroads, Adjudication procedure, Judicial decisions, Legal aspects, Barriers, Diversion, Relative rights, Drains, Culverts, Surface waters, Compensation, Damages, Drainage effects.

Plaintiff owned property adjacent to defendant railroad company's tracks. Defendant coal company constructed a switch from the main railroad tracks to its mines. The switch tracks were on a 6-foot embankment. Plaintiff brought an action for damages and other relief when insufficient drainage resulted in damage to plaintiff's property. Plaintiff obtained a judgment ordering defendants to improve culverts beneath the tracks. The instant action against the same defendants was brought when the enlarged culverts also proved inadequate. The trial court ruled for plaintiff on the basis of negligence by both defendants. Defendant railroad contended that it was not liable since the switch and culverts were built and maintained solely by defendant coal company. Defendant coal company claimed that the method of determining the proper amount of damages was improperly stated to the jury as being the diminution of value of the property rather than the decrease in its rental or use value. The court reversed as to defendant railroad and reversed and remanded as to defendant coal company for a new evaluation of damages. (Dye-Florida)
W71-01008

SPOO V GARVIN (OBLIGATION OF LOT OWNER TO GUARD AGAINST LOOSE SOIL FALLING ONTO ADJACENT LOT WHILE MAKING IMPROVEMENTS).
236 KY 113, 32 SW2d 715-717 (1930).

Descriptors: *Kentucky, *Damages, *Surface runoff, *Excavation, Judicial decisions, Legal aspects, Drainage, Drainage practices, Runoff, Surface waters, Embankments, Impounded water, Impoundments, Overland flow, Washouts.

Plaintiff landowner sought to recover damages and to enjoin defendant adjacent landowner from allowing surface water to wash over onto her property and carry with it loose soil from defendant's lot. Defendant denied plaintiff's allegations and by counterclaim contended that plaintiff's predecessor had lowered the level of her property by excavation so near his property line so as to cause his property to crumble over into plaintiff's lot during rainy periods. The court refused to hold plaintiff liable for an act of her predecessor. Plaintiff was entitled to remove soil that fell onto her lot, but was liable for the value of that soil appropriated for her use. The court stated that defendant, knowing drainage from his lot would fall on the adjoining lot when he was making improvements, should have guarded against loose dirt being carried thereto. The trial court had dismissed both claims, but had subsequently awarded nominal damages to defendant. The trial court's judgment was affirmed. (Price-Florida)
W71-01009

STATE V HUFFMAN (AVULSION EFFECTS NO CHANGE IN BOUNDARY LINES OF PROPERTY ABUTTING ON STREAM).
2 SW2d 582-584 (Mo 1938).

Descriptors: *Missouri, *Accretion (Legal aspects), *Avulsion, *Boundaries (Property), Boundary disputes, Missouri River, Channel morphology, Legislation, Legal aspects, Judicial decisions, Bank erosion, Erosion, Relative rights, Local governments.

In 1875 the boundary line between two counties was the middle of the Missouri River. The course of said river changed imperceptibly until 1915. At that time, the river abandoned its old channel suddenly by the process of avulsion. The dispute herein was whether the 1875 boundary line or the line established in 1922 to be in the center of the then abandoned river bed as it was in 1915, was to prevail. Plaintiff state argued for the 1875 boundary based on constitutional and statutory arguments, while defendant argued for the 1922 boundary based on case law and the common law. The court stated that where land is bordered on running water, and the banks gradually change by accretion, the stream continues to be the boundary line. However, where such a change occurs suddenly by avulsion, the boundary line remains in the center of the abandoned river bed. Therefore, the 1922 boundary set up in the abandoned river bed as it existed in 1915 following shifts due to accretion prevailed. The trial court's judgment for defendant was affirmed. (Price-Florida)
W71-01010

DOWNEY V PHELPS (TEST FOR DETERMINING WHETHER A TRACT IS DOMINANT OR SERVIENT TO ANOTHER.
208 NW 499-503 (Iowa 1926).

Descriptors: *Iowa, *Dikes, *Natural flow doctrine, *Overlying proprietors, Ditches, Levees, Natural flow, Floodwaters, Crop response, Drainage, Drainage effects, Drainage practices, Channel morphology, Ponds, Embankments, Discharge (Water), Overflow, Backwater, Diversion structures, Judicial decisions, Legal aspects, Land reclamation, Obstruction to flow.

Plaintiff landowners sought to enjoin defendants from maintaining a levee, or dike, on defendants' land, which allegedly obstructed the flow of water from plaintiffs' land. Defendants contended the damage to plaintiffs' land was due to natural causes. To be entitled to the relief sought, the court said that plaintiffs' would have had to show their land to be dominant to defendants' and that defendants' dike had impeded the natural flow of water from plaintiffs' property. All but one plaintiff had failed to prove their lands dominant to those of defendants', and as to him so proving, it was found that defendants' dike had no adverse effect on his land. As to which is the servient and which is the dominant estate in regard to the ordinary surface waters is determined by the relative elevation of the respective tracts, although it may be true that in times of flood both are entirely submerged and inundated. The trial court's judgment for plaintiffs was reversed. (Price-Florida)
W71-01011

JOHNSON V CHICAGO B AND Q RR (WAIVER OF RIGHT TO DAMAGES CAUSED BY OBSTRUCTION TO FLOW OF NATURAL DRAIN).
211 NW 842-846 (Iowa 1927).

Descriptors: *Iowa, *Obstruction to flow, *Easements, *Diversion, Damages, Surface waters, Natural flow, Natural flow doctrine, Bridges, Railroads, Missouri River, Right-of-way, Ditches, Drainage, Overflow, Diversion losses, Crop response, Drainage districts, Judicial decisions, Legal aspects, Real property, Land tenure.

Plaintiff brought action for damages allegedly caused by the obstruction of surface waters by defendant's railroad bridge. Plaintiff demurred to defendant's answer that it had been granted by plaintiff's predecessor in title the right to continue to maintain the bridge as it was originally constructed. It was so maintained at the institution of this action. The court concluded that plaintiff had the duty to inquire as to defendant's rights at the time plaintiff bought his adjacent property. A landowner may waive his rights to damages resulting from an obstruction causing a diversion of water from its natural course. Such a waiver was given to defendant by plaintiff's predecessor in title, and had plaintiff made inquiry in the exercise of reasonable diligence, he would have discovered the facts which he claimed had no binding effect on him. The judgment for defendant was affirmed. (Price-Florida)
W71-01012

VICK V STREHMEL (RIGHT OF UPPER PROPRIETOR TO CAST SURFACE WATERS OFF HIS PROPERTY).
222 NW 307-309 (Wis 1928).

Descriptors: *Wisconsin, *Surface drainage, *Surface waters, *Surface runoff, Drainage, Drainage water, Overland flow, Runoff, Watersheds (Basins), Drains, Flow, Natural flow, Judicial decisions, Relative rights, Overlying proprietor, Legal aspects, Flow augmentation.

Plaintiff landowner brought an action to enjoin defendant from using a drain to divert surface waters from defendant's land onto plaintiff's land. Plaintiff contended that the drain was used to remove a gathering of surface waters from defendant's land and that such surface waters would not have otherwise been cast upon plaintiff's land by any natural course. Defendant contended that surface water from his land flowed in the natural course of drainage to plaintiff's land and that the drain did nothing but hasten such flow. The court held that an upper proprietor has a right to rid his lands of surface waters by permitting or causing the same to flow in the natural drainage course onto adjoining lands. The court also held that such a proprietor can construct drains to carry surface waters where no new watershed is created. Thus from the evidence in the case, the court ruled that defendant had not acted improperly in constructing the drain to assist the flow of surface water along its natural course, even though the drain increased the water's flow. (Snow-Florida)

NORDLUM V GREAT NORTHERN RY (ALTERATION OF NATURAL COURSE OF DRAINAGE WATER BY RAILROAD BED CONSTRUCTION).
225 NW 145-146 (Minn 1929).

Descriptors: *Minnesota, *Surface drainage, *Surface waters, *Surface runoff, Drainage, Drainage water, Watersheds (Basins), Flow, Natural flow, Alteration of flow, Obstruction to flow, Damages, Flooding, Flood damage, Ponding, Judicial decisions, Overland flow, Railroads, Road banks, Adjudication procedure, Legal aspects.

Plaintiff brought an action to recover damages for alleged negligence by defendant railroad company. Plaintiff contended that defendant, by constructing a railroad bed adjacent to this property had altered the natural course of drainage which cased water to accumulate upon his land, to flood it and to injure his crops. Defendant contended that the railroad bed at no time was the cause of any flooding upon plaintiff's lands. The court reviewed the record and ruled that there was no evidence tending to show that the railroad bed interfered with the course of drainage. Thus the verdict for plaintiff was reversed and a new trial ordered. (Snow-Florida)
W71-01014

HICKEL V CHICAGO R I AND P RY (ALTERATION OF NATURAL COURSE OF DRAINAGE
227 NW 419-421 (Iowa 1919).

Descriptors: *Iowa, *Surface drainage, *Culver *Alteration of flow, Watercourses (Legal), Flo Drainage, Drainage water, Surface wate

ersheds (Basins), Conduits, Conveyance structs, Drains, Judicial decisions, Railroads, Roadks, Natural flow, Overland flow, Diversion, ural flow doctrine, Legal aspects.

suit to restrain defendant railroad company altering the natural course of drainage, plaincontended that defendant, by constructing a ert through a railroad bed, cast drainage water his land. Plaintiff contended that but for the ert altering the natural course of drainage, such r would have not flowed upon his land. Defen- contended that the natural course of the nage was across plaintiff's land and that, were it for defendant's roadbed, the drainage would in se be cast upon plaintiff's land. Thus defendended that the culvert was merely correcting natural drainage course which had been altered e construction of the roadbed. The court held the evidence indicated that the natural course rainage in that area was across plaintiff's land. s the construction of the culvert to restore the ral course, previously altered by the roadbed, proper. NAM V KINNEY (PUBLIC RIGHT TO FISH N NON-NAVIGABLE LAKE).
Mich 410, 227 NW 741-743 (1929).

criptors: *Ownership of beds, *Michigan, n-navigable waters, *Lakes, Fishing, Mean-, Navigable waters, Navigation, Riparian rights, cial decisions, Lake beds, Inland waterways, shores, Shores, Federal Government, Sur-, Public rights, Riparian land, Legal aspects, d tenure.

n action for an injunction, plaintiff sought to ain defendants from trespassing and fishing a lake on his property. Plaintiff contended the inland lake was subject to his sole control at he was the owner of all the land surrounding lake. Defendants contended that they had a of access to the lake and a right to fish upon ake, such rights being the rights of the general ic. Defendants contended that because the had been meandered by Federal Government eyors, the lake was thus a public navigable , which gave the public a right to navigate it to fish in its waters. The court held that the was not navigable in fact in that it was not ble of being used for purposes of commerce, e or travel. The fact that the lake had been ndered was immaterial. The court held that the rian proprietor owning all the shore line of an d lake is the owner of the land underneath the and has the exclusive right to the use of the . Defendants were thus restrained from invadplaintiff's lake. (Snow-Florida)

ARD OF SUPERVISORS V BOARD OF SUVISORS (COST SHARING BY ADJACENT AINAGE DISTRICTS).
NW 14-26 (Iowa 1932).

criptors: *Iowa, *Drainage districts, *Cost ing, *Drainage systems, Governments, Con-ed drainage, Ditches, Drainage effects, nage programs, Land management, Running rs, Surface waters, Water control, Water agement (Applied), Remedies, Legal aspects, allocation, Judicial decisions, Administrative cies.

ntiff lower drainage district sought a writ of damus to compel defendant upper drainage ict to assess the land within defendant district rder to pay a portion of the drainage improvet cost in plaintiff district. Plaintiff contended the landowners in defendant district impliedly ertook to assume the burden of paying a por- of the cost of improving the ditches of the r district by organizing the upper district and ing improvements which would necessarily lt in an increased flow to the lower district. Defendant contended that statutes providing for assessment to compensate for increased burdens on lower districts required that notice be given to those who might be assessed. Defendant further contended that no notice was given landowners residing in the upper district. The Supreme Court of Iowa held that the upper landowners were assessed with respect to the ratio of the district's outflow according to the statute and that no notice was required by the statute to those whose lands would not be taken for a right-of-way. The court ordered defendant to collect funds for the payment of their ratable portion of burden in the lower district's drainage system. (Quesada-Florida)
W71-01017

DALY V STATE (EXTRAORDINARY RAINFALL IS NO DEFENSE TO NEGLIGENCE IN MAINTAINING A CANAL).
226 App Div 154, 235 NYS 331-335 (1929).

Descriptors: *New York, *Floods, *Canals, *Rain water, Legal aspects, Judicial decisions, Remedies, Damages, Channels, Canal embankments, Drains, Ditches, Floodwater, Rain, Streams, Natural flow, Water injury, Farms, Crops, Streamflow, Forecasting, State Governments, Overflow, Excessive precipitation.

Plaintiff sued for damages which resulted to his crops when water from defendant state's Champlain Canal overflowed onto his farm. Plaintiff alleged that defendant was negligent in maintaining the unused canal. Defendant contended the overflow was caused by an extraordinary rainfall and that the overflow might have occurred even if the canal had not been there. The court, in reversing the trial court's judgment for defendant, held that extraordinary rainfall is not a defense to negligence although an act of God would be. The court also held that any consideration of whether the flooding would have occurred without the canal's presence was speculation. (Morris-Florida)
W71-01018

MANLEY V NEW YORK CENT RR (LIABILITY FOR IMPROVEMENTS WHICH BLOCK NEIGHBOR'S SURFACE DRAINAGE).
227 App Div 206, 237 NYS 273 (1929).

Descriptors: *New York, *Surface waters, *Drainage, *Repulsion (Legal aspects), Legal aspects, Judicial decisions, Remedies, Damages, Boundaries (Property), Surface runoff, Drainage water, Drainage pattern (Geologic), Railroads, Obstruction to flow, Barriers, Natural flow, Relative rights.

Plaintiff sought damages from defendant railroad company, alleging that defendant was blocking the flow of surface water off plaintiff's property. Defendant answered that any blockage occurred in the improvement and maintenance of its railroad lines. The natural flow of the surface waters was from plaintiff's land on and through defendant's land until defendant made the improvements. In a per curiam decision which reversed a lower court decision for plaintiff, the court held that defendant had a right to improve his property, even though it blocked the waters, as long as it did not act in bad faith or negligently. (Morris-Florida)
W71-01019

DOUNCE V CITY OF ELMIRA (LIABILITY FOR FLOOD DAMAGE).
237 App Div 379, 261 NYS 757-761 (1932).

Descriptors: *New York, *Floods, *Landfills, Legal aspects, Grading, Judicial decisions, Damages, Remedies, Local governments, Land forming, Streams, Rainfall, Streamflow, Channels, Floodwater, Drainage, Natural flow, Bridges, Flood damage, Surface waters, Excessive precipitation.

Plaintiff landowner sued defendant city for damages which resulted from the flooding of his land after defendant raised the level of certain land on the opposite side of a stream and built bridges over it. Plaintiff asserted that before defendant filled in such low-lying land, that land and not plaintiff's was flooded during flood season. Defendant insisted the flooding was caused by abnormal rainfall and not by its negligence. The court reversed a lower court judgment for plaintiff. The court found both sides of the stream had been filled so as to change the natural conditions and that the stream's floodwaters did not flow in defined channels but became surface waters. The court found defendant was not negligent in filling its own land or building the bridges, and that any damages to plaintiff were damnum absque injuria. (Morris-Florida)
W71-01020

JOHNSON V HUME (CONSTITUTIONALITY OF STATUTE GOVERNING CHANGE OF PROPERTY BOUNDARY DUE TO ACCRETION OR CHANNEL EROSION).
137 SE 56-57 (Ga 1927).

Descriptors: *Georgia, *Accretion (Legal aspects), *Boundaries (Property), *Channel erosion, Legislation, Legal aspects, Judicial decisions, Boundary disputes, Prescriptive rights, Land tenure, Real property, Non-navigable waters, Streams, Riparian rights, Riparian land, Riparian waters, Ownership of beds.

Plaintiff riparian owner sued to enjoin his grantor from trespassing on plaintiff's land. In reversing a judgment for defendant, the court held that a Georgia statute, which provided that property boundaries comprised of non-navigable streams changed when the channel of the stream gradually changed and that accretions on either side of the stream accrued to the adjacent landowner, did not violate the due process clauses of the state and federal constitutions. (Liptak-Florida)
W71-01021

COUCH V CLINCHFIELD COAL CORP (COAL COMPANY'S LIABILITY FOR DIVERTING FLOW OF PERCOLATING WATER).
139 SE 314-317 (Va 1927).

Descriptors: *Virginia, *Percolating water, *Alteration of flow, *Mining, Groundwater, Land subsidence, Overlying proprietor, Water sources, Water supply, Wells, Groundwater movement, Water wells, Water rights, Coal mines, Excavation, Appropriation, Natural flow doctrine, Preferences (Water rights), Judicial decisions, Legal aspects, Diversion.

Plaintiff landowner brought action against defendant coal company to recover damages resulting from a subsidence of defendant's adjacent property which caused plaintiff's well to dry up. Plaintiff contended that he was entitled to lateral and subjacent support and to the natural flow of the underground percolating water beneath his property. Plaintiff alleged that defendant was negligent in its mining operations, thereby causing the subsidence and the diversion of the water. Defendant contended that the doctrine of lateral and subjacent support was not applicable since plaintiff's property was not disturbed and no mining was done under his property. Furthermore, there was no liability for diverting undefined underground percolating water. Affirming a judgment for defendant, the court held that lateral and subjacent support did not apply. Moreover, no cases had been found denying landowners the right to divert percolating water--even though the diversion ruins a neighbor's well or underground spring. (Liptak-Florida)
W71-01022

MOODY V BURRELL (REMEDY FOR POLLUTION OF WATER SUPPLY BY DOMESTIC SEWAGE SYSTEM).
146 SE 753 (Ga 1929).

Descriptors: *Georgia, *Water pollution, *Domestic wastes, *Sewage disposal, Pollutants, Water pollution sources, Pollution abatement, Wastes, Water quality, Domestic water, Potable water, Water supply, Sewage, Septic tanks, Sewage systems, Spring water, Legal aspects, Judicial decisions, Remedies.
Identifiers: Injunction (Prohibitory).

Plaintiff hotel operator sued to restrain defendant property owner from constructing a septic tank and sewage system which allegedly would contaminate a spring which served as plaintiff's water supply for her hotel guests. Plaintiff further contended that the sewage system would infect her water supply and was therefore a nuisance. Defendant offered evidence that plaintiff's water supply would not be affected. In view of the sharply conflicting evidence, the court affirmed the order denying plaintiff an interlocutory injunction and dissolving the temporary restraining order. (Liptak-Florida)
W71-01023

MCNABB V HOUSER (DIVERSION OF WATER FROM A NON-NAVIGABLE STREAM).

156 SE 595-599 (Ga 1931).

Descriptors: *Georgia, *Division, *Natural flow doctrine, *Non-navigable waters, Streams, Streamflow, Obstruction to flow, Diversion structures, Alteration of flow, Riparian rights, Riparian land, Riparian waters, Ditches, Dams, Mills, Mill dams, Sawmills, Hydroelectric plants, Legal aspects, Judicial decisions, Remedies.
Identifiers: Injunction (Prohibitory).

Plaintiff riparian owner sued to enjoin defendant riparian owner from diverting water from a non-navigable stream flowing from defendant's property through plaintiff's property. Plaintiff contended that the ditch defendant was digging would interrupt the natural flow of the stream and would render plaintiff's corn mill, sawmill, cotton gin and hydroelectric plant inoperable. Defendant contended that there was more than eough water in the stream to supply plaintiff's several operations and defendant's mining operations and that plaintiff was estopped from complaining of the diversion after standing by silently while defendant expended large sums of money constructing the ditch. Affirming a judgment for plaintiff, the court held that any diversion was an interference with plaintiff's right to the natural flow of the stream and that plaintiff was not estopped from seeking an injunction since he was under no duty to speak and defendant had not relied on plaintiff's silence when he constructed the ditch. (Liptak-Florida)
W71-01024

INTERNATIONAL SHOE CO V GIBBS (POLLUTION OF STREAM BY MANUFACTURE).

36 SW2d 961-963 (Ark 1931).

Descriptors: *Arkansas, *Water pollution, *Industrial wastes, *Damages, Cattle, Pastures, Streams, Sewage, Septic tanks, Sewage disposal, Water pollution sources, Water pollution effects, Judicial decisions, Legal aspects, Adjudication procedure.

Plaintiff landowner sued defendant shoe manufacturer for pollution injury to a stream crossing plaintiff's land. Plaintiff rented the land for use as a cow pasture. A small dwelling on the property was also rented. Defendant constructed a septic tank on its adjacent land, and the tank overflowed into the stream. Plaintiff alleged that the sewage caused offensive odors, so that cattle refused to drink it, and that the dwelling was made uninhabitable. Accordingly, defendant contended the value of his land was diminished. Defendant argued that the injury was temporary rather than permanent and that the jury award was excessive. The court noted that defendant had not previously raised the question of permanent injury and, therefore, held that defendant could not complain on appeal that the injury was temporary. The jury verdict was held not to be excessive, and lower court's judgment for plaintiff was affirmed. (Hart-Florida)
W71-01025

PERRY V SIMPKINS (POLLUTION OF FARM AND STREAM BY FLUORSPAR MINE).
260 Ky 151, 84 SW2d 35-38 (1935).

Descriptors: *Kentucky, *Water pollution, *Mine wastes, *Farms, Agriculture, Damages, Water pollution effects, Water pollution sources, Pollutants, Crops, Flooding, Flood damage, Hydraulic mining, Sedimentation, Sediment discharge, Judicial decisions, Legal aspects, Adjudication procedure.
Identifiers: Injunction.

Plaintiff farm owner sued defendant fluorspar mining operator for pollution injury to a stream crossing plaintiff's land. Defendant's mining wastes discharged into the stream and caused the stream to fill with sediment. When the stream overflowed plaintiff's property, pollutants were deposited on the farmland. Defendant contended that no damage was proven and that the injunction granted by the chancellor below was too broad. Reviewing the chancellor's fact findings, the court held that the evidence sustained the finding of permanent damage. Finding that it only prohibited defendant from further pollution of the stream, the injunction was upheld by the court. (Hart-Florida)
W71-01026

FIRE DIST NO 1 V GRANITEVILLE SPRING WATER CO (PROPOSED DIVERSION OF SPRING WATERS AS A VIOLATION OF LOWER LANDOWNER'S RIPARIAN RIGHTS).

152 A 42-44 (Vt 1930).

Descriptors: *Vermont, *Percolating water, *Riparian rights, *Reasonable use, Natural flow, Relative rights, Groundwater, Surface waters, Diversion, Obstruction to flow, Water utilization, Springs, Streams, Reservoirs, Alteration of flow, Competing uses, Legal aspects, Surface-groundwater relationships, Judicial decisions.

Plaintiff sought to enjoin defendant from diverting water from a stream, claiming that a proposed development of such spring on defendant's property would result in the stream being prevented from flowing onto plaintiff's property. The court recognized that under Vermont law a landowner is the exclusive owner of all groundwater beneath his property. However, when the water comes to the surface and becomes part of a flowing stream, the landowner is held to a reasonable use standard in utilization of this water. Therefore, the court held that while plaintiff had no rights in the percolating waters under defendant's property, it did have a legal interest in the flowing spring waters against anyone who unreasonably diverted water in violation of plaintiff's riparian rights. The case was remanded for a factual determination of whether defendant's proposed diversion was reasonable. (Caldwell-Florida)
W71-01027

SCHLICHTKRULL V MELLON-POLLOCK OIL CO (ILLNESS CAUSED BY POLLUTION OF WELL).
301 Pa 560, 152 A 832-834 (1930).

Descriptors: *Pennsylvania, *Water pollution, *Saline water intrusion, *Water wells, Oil industry, Public health, Oil wells, Drilling, Oil fields, Saline water, Saline water-freshwater interfaces, Wells, Well casings, Groundwater, Water supply, Percolating water, Subsurface waters, Judicial decisions, Legal aspects, Adjudication procedure.

Plaintiff landowner brought suit for damages against defendant oil company. Defendant had drilled an oil well and thereby caused salt to accumulate in plaintiff's water well. Plaintiff's wife became ill and plaintiff claimed the illness was caused by the salt in the water. The Supreme Court of Pennsylvania, reversing the trial court's decision for plaintiff, ruled that before an action for negligence in drilling an oil well would lie, danger to public health must have been foreseeable. Plaintiff had not met the burden of proof requisite to such an action. (Barker-Florida)

SISTERS OF ST JOSEPH CORP V ATLA SAND, GRAVEL AND STONE CO (FLOO DAMAGE RESULTING FROM NEGLIGENTL CONSTRUCTED CULVERT).
120 Conn 168, 180 A 303-07 (1935).

Descriptors: *Connecticut, *Culverts, *Surface r noff, *Overflow, Surface drainage, Flood damag Drainage engineering, Legal aspects, Relati rights, Natural flow, Channel flow, Flow augment tion, Drainage practices, Repulsion (Leg aspects), Damages, Judicial decisions, Cos Remedies, Streams, Riddance (Legal aspects).

Defendant corporation had constructed a culve through which a creek ran upon leaving plaintif land. Plaintiff claimed the culvert was too small a was negligently constructed, thereby causing su face runoff to back up onto plaintiff's property. D fendant contended that most of the flood dama had been caused by increases of surface water flo into the creek resulting from street paving and la ing of drains by the city. Finding no evidence dicating that any of plaintiff's damage was due the city's actions, the court rejected defendan claim. The court stated that defendants had a du to keep a channel which would carry off the wat of the creek, even in times of heavy rain, in amount equivalent to the natural capacity of creek. The court rejected defendant's claim t the cost to it of repairing the culvert would be m than the value of any corresponding relief to plaintiff. A lower court decision for the plain was affirmed. tifiers: *Title disputes.

tiff state brought action to quiet title in lands by defendant swamp owner. The disputed land originally within a meander line established by ited States surveyor. However, after discovery the meander line was improperly established rc there was no navigable lake, a new survey plat had been made. At that time, title to the was in the United States, who conveyed it to tiff; plaintiff reconveyed to the local county. ndant claimed title by adverse possession from county. Plaintiff contended that all lands within meander line were held in trust for the people. The court agreed that this was generally true, but noted that a surveyor, by drawing a meander line on a survey, could not create a lake where one did not exist. The new survey had nullified the meander line. Holding that the further conveyance to the county was valid, and that defendant had established adverse possession against the county, the court affirmed the lower court's decision for defendant. GAUVREAU V GULF REFINING CO (LIABILITY FOR POLLUTION OF WATER BY LEAKING GASOLINE TANK).

288 Mass 54, 192 NE 220 (1934).

Descriptors: *Massachusetts, *Water pollution, *Gasoline, *Leakage, Legal aspects, Judicial decisions, Damages, Water pollution effects, Water pollution sources, Wells, Artesian wells, Poisons, Fuels, Oil, Maintenance, Repairing, Installation, Adjudication procedure.

Plaintiff wife and daughter sued defendant oil company for pollution of a well and injury to their health. Defendant had installed gasoline tanks and pumps on plaintiff's property under a contract with the husband of plaintiff. Defendant claimed the contract gave the husband the duty to maintain the tanks. The lower court instructed the jury that plaintiffs could recover from defendant only for negligent installation of the tanks, and the jury found no negligence. The Supreme Judicial Court of Massachusetts stated that the replacement of a leaky pipe by defendant was not an admission of liability and held that the trial court's instruction was proper. (Morris-Florida)

ROOT REFINERIES, INC V ROBERTSON (POLLUTION OF FARM STREAM BY OIL REFINERY).
3 SW2d 57-58 (Ark 1928).

Descriptors: *Arkansas, *Water pollution, *Oil industry, *Dairy industry, Oil, Oil wastes, Oily water, Water pollution sources, Compensation, Damages, Streams, Water pollution effects, Pollutants, Judicial decisions, Legal aspects, Adjudication procedure, Leases, Rent, Cattle.
Identifiers: Nuisance (Continuing).

Plaintiff leaseholder sued defendant oil refinery for pollution injury to a stream which plaintiff used to water dairy cattle. Defendant had permitted oil to discharge into the stream, rendering it unfit for the cattle. Defendant contended that the stream had never been suitable for watering cattle and that the pollution was a permanent injury rather than a continuing nuisance. The appellate court, holding that the evidence clearly pointed to both the prior fitness of the stream for watering cattle and to pollution by defendant, affirmed the lower court's judgment for plaintiff. The court further held that since defendant could easily have prevented escape of oil into the stream, and since plaintiff was not the owner of the tract but a tenant at sufferance, the injury was a continuing nuisance. The proper measure of damages was the diminution in rental value. (Hart-Florida)
W71-01035

BLANKENSHIP V KANSAS EXPLORATIONS, INC (DAMAGES FOR POLLUTION OF MILLPOND BY MINE SLUDGE).

30 SW2d 471-480 (Mo 1930).

Descriptors: *Missouri, *Mills, *Sludge, *Damages, Water pollution, Mine wastes, Mill dams, Mineral industry, Mine drainage, Mining, Compensation, Streams, Ponds, Sludge disposal, Profit, Depreciation, Costs, Judicial decisions, Legal aspects, Adjudication procedure.
Identifiers: Injury (Temporary), Injury (Permanent).

Plaintiff millowner sued defendant mining company for damages from pollution. Defendant's plant was upstream from plaintiff's dam and millpond, and the mining wastes discharged into the stream by defendant caused the millpond to fill with sludge. As a result, the water power from the stream was insufficient to operate the mill. Defendant contended that the injury was temporary rather than permanent. Sustaining this assertion, the court held that the trial court should have submitted the issue to the jury. However, the court noted that plaintiff's failure to allow the stream to run the sludge from the pond did not relieve defendant from liability. Furthermore, it was found that plaintiff could recover for the lesser of: the diminution in the mill's market value, or the cost of removing the sludge. If plaintiff recovered the diminution in market value, he could not recover for lost profits. Lost profits could be recovered if removal cost was less than the diminution in market value. (Hart-Florida)
W71-01036

NORTON COAL MINING CO V WILKIE (POLLUTION OF FARM BY COAL WASHERY).

224 Ky 192, 5 SW2d 1058-1061 (1928).

Descriptors: *Kentucky, *Water pollution, *Coal mining wastes, *Damages, Water pollution effects, Water pollution sources, Pollutants, Farms, Agriculture, Crops, Crop production, Flooding, Flood damage, Coal mines, Hydraulic mining, Sedimentation, Sediment discharge, Judicial decisions, Legal aspects, Adjudication procedure.

Plaintiff farm owner sued defendant coal mining company for pollution of a stream coursing plaintiff's farm, the pollution resulting from defendant's coal washery. Plaintiff alleged that the pollution sediment injured his soil and crops when the stream overflowed. The court held that: (1) in order to recover for crop damage, plaintiff must show the diminution in crop profits for each year involved; (2) court instructions should confine damage recovery to injury proximately caused by the pollution; and (3) plaintiff could not recover for injury which could have been avoided by reasonable care. The evidence presented by plaintiff was too vague and intangible to support the jury verdict, and the court therefore reversed the lower court's judgment for plaintiff. (Hart-Florida)

CITY OF NEW YORK V THIRD AVE RY (EXTENT OF RIPARIAN RIGHT OF ACCESS TO NAVIGABLE RIVER).
264 App Div 193, 34 NYS2d 874-876 (1942).

Descriptors: *New York, *Riparian rights, *Relative rights, *Navigable rivers, Riparian land, Riparian waters, Navigable waters, Ownership of beds, Docks, Piers, Rivers, Judicial decisions, Structures, Cities, Land tenure, Legal aspects, Access routes.

In a per curiam decision, the court considered the relative rights of plaintiff and defendant to the use of a navigable river passing through plaintiff municipality and adjacent to property owned by defendant. The court held that defendant, as a riparian owner, had a right to access to the river for the purpose of loading and unloading boats, drawing nets and the like. As an incident to those rights, the riparian owner could erect such structures as a dock or pier between the upland and the navigable water. However, inasmuch as plaintiff was the owner of the property between the upland and the navigable water, the riparian owner had no right to construct structures which would occupy a substantial area and which would be used as an extensive storage facility. The trial court's judgment for defendant was reversed, and a new trial was ordered. (Snow-Florida)
W71-01039

KUNKLE V BOROUGH OF FORD CITY (OBSTRUCTION TO FLOW OF SWAMP DRAINAGE).
305 Pa 416, 158 A 159-161 (1931).

Descriptors: *Pennsylvania, *Watercourses (Legal), *Obstruction to flow, *Drainage water, Drainage, Adjudication procedure, Natural streams, Judicial decisions, Legal aspects, Cities, Local governments, Running water, Streams, Eminent domain, Real property, Land, Surface drainage, Paving, Roads, Surface waters, Precipitation excess, Runoff, Storm runoff, Diversion, Swamps.

Plaintiff landowner brought an action in trespass contending that defendant city's street improvements had diverted a natural watercourse, causing surface water to collect on plaintiff's property. Plaintiff's property was south of a swamp and north of a public road. In times of heavy rainfall, water from the swamp flowed across plaintiff's land, beneath the road, and onto property south of the road. Defendant's road improvements obstructed drainage beneath the road and allowed water draining from the swamp to collect north of the road on plaintiff's property. Defendant contended that the route of water from the swamp was not a natural watercourse and was subject to lawful diversion. The Supreme Court of Pennsylvania agreed with defendant. A natural watercourse is one ordinarily evident and not solely dependent on rains for its existence. Water drained from this swamp only in times of extraordinarily heavy rainfall. An eminent domain action was plaintiff's proper remedy. (Dye-Florida)

LACKAWANNA MILLS V SCRANTON GAS AND WATER CO, (NON-RIPARIAN RIGHTS TO WATER).
150 A 633-636 (Pa 1930).

Descriptors: *Pennsylvania, *Usufructuary right, *Appropriation, *Water rights, Prior appropriation, Riparian rights, Prescriptive rights, Legal aspects, Judicial decisions, State governments, Water contracts, Regulation, Water sources, Dams, Reservoirs, Streams, Water supply, Supply, Pipelines, Industrial water, Water users, Industrial plants, Mills.

Plaintiffff companies and their predecessors in title had for years used the waters of a nearby stream to supply the water needs of their plants located on nonriparian lands. Defendant water company undertook to dam the stream at its source and executed contracts with plaintiffs' predecessors for the sale of water to them for an indefinite period at a specified price. This action was commenced by plaintiffs when the contract price was declared discriminatory, and defendant sought to charge plaintiffs the price specified by the Public Service Commission. Plaintiffs contended that the contract represented recognition by defendant of plaintiffs' property right in the water and estopped defendant from denying such a right or charging a higher rate. Defendant contended that plaintiffs' execution of the contract represented admission by plaintiffs of defendant's ownership of water rights in the stream. The court stated that plaintiffs' rights to water at the contract price ceased when the rate became discriminatory, and affirmed the lower court's judgment for defendant. (Dye-Florida)
W71-01041

DONNELLY BRICK CO V CITY OF NEW BRITAIN (POLLUTION OF RIPARIAN WATERS).
137 A 745-749 (Conn 1927).

Descriptors: *Connecticut, *Water pollution, *Riparian rights, *Flooding, Water pollution sources, Water pollution effects, Public rights, Judicial decisions, Legal aspects, Waste disposal, Sewage disposal, Adjudication procedure, Riparian land, Municipal wastes, Cities, Local governments, Streams, Real property, Damages, Domestic wastes, Drainage, Floods, Precipitation excess.

Defendant city increased the flow of water in a stream through plaintiff's property by obstructing the flow of upper branches of the stream and emptying into the stream waste waters not natural to the watershed. A heavy flood caused the polluted waters of the stream to overflow plaintiff's dikes and inundate his land. Plaintiff sought damages and an injunction restraining defendant from further polluting the stream. Plaintiff contended that he was entitled to the use of the stream containing only its natural waters and that the city's pollution of the stream constituted a continuing nuisance. Defendant contended that disposal of the sewage was a public necessity and administered with reasonable care. The Supreme Court of Errors of Connecticut reversed the lower court's judgment for defendant. Public necessity does not excuse impairment by an upper riparian owner of a lower riparian owner's right to natural flow. The pollution of the stream was a continuing nuisance for which defendant was liable in damages. The court further stated that the act of God doctrine is not applicable unless an unprecedented storm is the sole cause of injury. (Dye-Florida)
W71-01042

ROSE V SOCONY-VACCUUM CORP (POLLUTION OF STREAMS BY SUBSTANCES IN GROUNDWATER).
173 A 627-632 (RI 1934).

Descriptors: *Rhode Island, *Seepage, *Water pollution, *Percolating water, Riparian rights, Relative rights, Water pollution effects, Streams, Groundwater, Judicial decisions, Legal aspects, Riparian land, Percolation, Subsurface waters, Underground streams, Groundwater movement, Path of pollutants, Soil water movement, Oily water, Oil wastes, Water pollution sources.

Defendant operated a refinery on property adjacent to that of plaintiff. On plaintiff's property were a well and a stream used by plaintiff to water his pigs and hens. Collections of petroleum products on defendant's land entered percolating waters beneath the land and thereby passed to the water sources on plaintiff's land. This rendered the water unfit for animal consumption and caused the death of numbers of plaintiff's poultry and livestock. Plaintiff sought damages and an injunction, alleging that defendant was perpetuating a nuisance on his property. No negligence was alleged. Defendant's demurrer was sustained, and the appellate court affirmed, rejecting the doctrine of Rylands v Fletcher and stating that negligence must be shown for recovery where pollution is spread by percolating waters. The rule that one riparian owner may not injure another's use of the water was held to apply to surface streams and not to percolating waters, where the location and course of the water is generally unknown. (Dye-Florida)

BARRINGTON HILLS COUNTRY CLUB V VILLAGE OF BARRINGTON (DISCHARGE OF SEWAGE INTO RIPARIAN WATERS).
357 Ill 11, 191 NE 239-244 (Ill 1934).

Descriptors: *Illinois, *Water pollution, *Sewage disposal, *Cities, Riparian rights, Water pollution sources, Water pollution effects, Legal aspects, Adjudication procedure, Judicial decisions, Local governments, State governments, Municipal wastes, Domestic wastes, Streams, Eminent domain, Compensation, Riparian land, Relative rights, Public rights, Waste disposal, Pollution abatement.

Plaintiff riparian landowners sought to restrain defendant village from dumping sewage into a stream adjacent to their properties. Evidence demonstrated the existence and source of the pollution, which plaintiffs contended was a private nuisance. Defendant contended that: (1) the creation by the state of a sanitary water board removed jurisdiction from the court; (2) the value of sewage disposal should be balanced against damages to plaintiffs; and (3) defendant's sewage treatment plant was the most modern available, and (4) the village had the inherent right to discharge sewage water into the stream since it was the only water available therefor. The Supreme Court of Illinois affirmed for plaintiffs. The sanitary water board had jurisdiction over cases involving public rights only. This case involved private rights. Moreover, the city had no inherent right to dump sewage. It could not impinge upon the private rights of riparian owners without eminent domain proceedings and compensation. Plaintiff riparian owners had the right to have the stream carry only water naturally coming from their watershed. (Dye-Florida)
W71-01044

HENDRIX V ROBERTS MARBLE CO (RIPARIAN RIGHTS LIMITED TO RIPARIAN LAND).
165 SE 223-226 (Ga 1932).

Descriptors: *Georgia, *Diversion, *Riparian land, *Riparian rights, Alteration of flow, Water utilization, Pipelines, Water distribution (Applied), Pipes, Dams, Damsites, Reservoirs, Pumping, Reasonable use, Remedies, Judicial decisions, Legal aspects, Riparian water.

Plaintiff riparian landowner sold his right to use the water of a stream to a non-riparian landowner who installed a pipe to divert the flow of the water. Defendant riparian owner cut the pipe in order to have the normal flow of the stream continue, and plaintiff sought to enjoin defendant's interference. Defendant claimed that plaintiff riparian owner could not convey the right to use the water to a non-riparian owner. The Supreme Court of Georgia ruled that riparian rights are appurtenant only to lands which actually touch on the watercourse. A riparian owner may not convey to another the right to use the water on non-riparian land physically separated from the watercourse. The injunction sought by plaintiff was denied, and defendant was granted an injunction against plaintiff's maintenance of the pipeline diversion. (Barker-Florida)
W71-01045

MASONITE CORP V BURNHAM (LIABILITY FOR WATER POLLUTION).
146 So 292-296 (Miss 1933).

Descriptors: *Mississippi, *Damages, *Water pollution, *Industrial wastes, Discharge (Water), Boundaries (Property), Community development, Easements, Judicial decisions, Land tenure, Legal aspects, Proprietary power, Riparian land, Riparian rights, Riparian waters, Watercourses (Legal), Water wastes (Pollution), Domestic wastes, Sewage, Remedies, Relative rights, Wastes, Waste disposal.

Defendant corporation discharged effluent into a stream which flowed across plaintiff's property. A nearby municipality had purchased the right to pollute the same stream with sewage long before plaintiff acquired his land. It was apparent from the fact that after defendant began emptying its waste into the stream, the degree of pollution increased. In reversing the trial court's judgment for plaintiff, the Supreme Court of Mississippi held that where different parties discharge sewerage and filth into a stream which intermingles and causes an actionable nuisance, such parties are not jointly liable for damages where there is no common design or concert of action, but each is liable only for his proportion of the damages. Consequently, plaintiff's damages were limited to those attributable to the additional pollution in the stream caused by defendant's discharge of waste. (Clarke-Florida)

sation, Eminent domain.

ntiff city sought to condemn an easement
ss defendant's property for a new sewer main
to acquire the right to use a stream traversing
ndant's property for an overflow outlet for the
's sewer district. Defendant appealed from the
age award and claimed that the city's disposal
ewage into the stream would cause water pollu-
which would in turn cause great damage to
. Plaintiff argued that the stream was already
uted by slaughter houses upstream, that the
er overflow into the stream would be minimal
that riparian owners could not complain of or-
ry pollution. The court noted that riparian
ers are subject to pollution caused by natural
nage of other riparian land, but held that plain-
could not collect and discharge sewage into the
am in an amount greater than existing pollu-
. After reviewing the conflicting evidence, the
rt affirmed the damage award. (Liptak-Florida)

ction to flow, Natural flow, Alteration of flow.

ntiff lower riparian landowner sought an in-
ction against defendant railroad company to
vent defendant from damming a stream which
ed from defendant's land onto plaintiff's land.
ntiff contended that defendant had entered into
venant with plaintiff in which defendant agreed
to prevent the stream from flowing onto plain-
s land in any way. Defendant acknowledged the
enant but contended that in order for such an
nction to issue, plaintiff had to prove damages
n the damming of the streamflow. While hold-
that a riparian proprietor is entitled to have
er flow onto his land in its natural course un-
inished in quantity and unimpaired in quality,
Court of Appeals of Kentucky found that plain-
had failed to establish such damages as were
essary in order for an injunction to issue based
a convenant not to prevent natural streamflow.

ntiff island owner sued defendant United States
damages arising from defendant's failure to
ntain a dike to protect plaintiff's island. There
an 8-foot channel along plaintiff's island, and
artificial 3 1/2-foot dike between the channel
the island. Defendant increased the channel
th to 22 feet, but did not strengthen the dike.
ause of increased water flow in the deeper
nnel, several annual storms broke the dike.
ntiff contended that defendant was negligent in
ing to strengthen the dike. Defendant asserted
unprecedented storms were the proximate
se of plaintiff's injury. The court found that the storms were not unusual. Furthermore, the court, noting that it was common knowledge that water pressure increased proportionately with volume and velocity, concluded that defendant should have realized the consequences of its inaction. The court held defendant liable for the injury, giving judgment without interest for plaintiff. (Hart-Florida)

NORFOLK SOUTHERN RR V UNITED STATES (FEDERAL GOVERNMENT'S LIABILITY FOR ORDERING REMOVAL OF RAILROAD BRIDGE TO IMPROVE NAVIGATION).
96 Ct Cl 357-377 (1942).

Descriptors: *United States, *Channel improvement, *Bridges, *Condemnation, Condemnation value, Eminent domain, Navigation, Navigable waters, Canals, Railroads, Federal jurisdiction, Legal aspects, Judicial decisions, Federal government, Legislation, Rivers and Harbors Act, Inland waterways, Virginia, Compensation.
Identifiers: Intracoastal waterway.

Plaintiff railroad brought an action against defendant United States to recover damages cuased by plaintiff's replacement of a bridge under defendant's orders so that defendant could deepen and widen a canal to be used in the intracoastal waterway. Plaintiff contended that the order amounted to a taking of property and the governmental immunity had been waived by an act of Congress. Defendant argued that the government had the power to order removal of obstructions to navigation, that the exercise of that power was not a taking of property and that the act of Congress simply conferred jurisdiction on the court to hear the claim but did not create any liability. The court noted that Congress had considered all the facts and all the decisions concerning sovereign immunity. Therefore, for the act to have any meaning at all, it must have been intended to create liability where there ordinarily is none. Consequently, the court held that plaintiff was entitled to a judgment for damages. One judge concurred on the ground that the bridge was not an obstruction to navigation when it was ordered destroyed since only later was the canal widened. Therefore, the order to replace the bridge was a taking of property. (Liptak-Florida)

NORTHWEST RR V UNITED STATES (STRUCTURES ERECTED IN BED OF NAVIGABLE STREAM SUBJECT TO DESTRUCTION WITHOUT REMEDY BY UNITED STATES IN AID OF NAVIGATION.

100 Ct Cl 396-413 (1943).

Descriptors: *Virginia, *Eminent domain, *Navigation, *High water mark, Damages, Compensation, Riparian rights, Leases, Mining, Dams, Flooding, Overflow, Vegetation, Ownership of beds, Legislation, Federal government, Condemnation value, Judicial decisions, Legal aspects, Rivers and Harbors Act, Channel improvement, United States.

Plaintiff corporation constructed a coal tipple in a navigable stream. Subsequently, the level of the river was raised by defendant United States, which caused plaintiff's property to be overflowed and its tipple to be rendered useless. Plaintiff sought damages for injury to its land and reimbursement for the cost of the tipple. Defendant contended that only the value of the overflowed land above the ordinary high water mark was recoverable. The court stated that the high water mark is the line where the water stands sufficiently long to destroy vegetation below it. A riparian owner owns to the low water mark under Virginia law, but title to the bed of the stream up to the ordinary high water mark is subject to a paramount servitude in the United States in the interest of navigation. He who erects a structure in the bed of a navigable stream must do so with the knowledge that the United States can, in the aid of navigation, raise the high water mark so as to destroy or impair the utility of the structure. Consequently, plaintiff was entitled to recover damages for the land overflowed, but not for damage to the tipple. (Price-Florida)

UNITED STATES V APPALACHIAN ELECTRIC POWER CO (FEDERAL GOVERNMENT'S REGULATORY AUTHORITY OVER HYDROELECTRIC PLANT ON A NON-NAVIGABLE, INTERSTATE RIVER).
107 F2d 769-810 (4th Cir 1939).

Descriptors: *Rivers and Harbors Act, *Hydroelectric project licensing, *Non-navigable waters, *Federal jurisdiction, Interstate rivers, Dams, United States, Hydroelectric plants, Federal Power Act, Legislation, Permits, Administrative agencies, Virginia, Navigable rivers, Regulation, Judicial decisions, Legal aspects, Eminent domain, Condemnation, Riparian rights, Navigation, Federal government, Administrative decisions.

Plaintiff United States sued defendant electric power company to enjoin construction of a dam and electric power plant on an interstate river. Defendant had not obtained a license from the Federal Power Commission. Plaintiff contended that the river was navigable and therefore subject to the Rivers and Harbors Act. The act prohibited obstructions to navigation without the consent of Congress or a license from the Power Commission. Defendant argued that the river was not navigable, that Congress' power was limited to control of navigation, and that any controls not connected with navigation were an invalid taking of property. Affirming a judgment for defendant, the court reviewed extensive evidence and concluded that the river's navigability was not established. The Power Commission's authority did not extend to the dam project except to the extent that the dam might possibly affect navigation on other rivers. One justice dissented. (Liptak-Florida)

DIEHM V BOROUGH OF NEW HOLLAND (DAMAGES FOR DIVERSION OF WATER FLOW).
191 A 393-395 (Pa Super 1937).

Descriptors: *Pennsylvania, *Water sources, *Riparian rights, *Diversion, Streams, Spring waters, Water supply, Riparian land, Riparian waters, Alteration of flow, Domestic water, Obstruction to flow, Stock water, Judicial decisions, Reasonable use, Streamflow, Natural flow, Springs, Usufructuary right, Water users, Relative rights.

Plaintiff, a riparian owner, brought an action against defendant, an upper riparian owner, for damages for diverting creek waters from plaintiff's land. Plaintiff contended that defendant piped water away from a spring which supplied the creek and as a result the flow of the creek became so small as to be insuffucient for plaintiff's reasonable domestic and stock purposes. Defendant contended that the taking of the water had not diminished the flow to any appreciable extent in that the spring contributed but a small part to the creek's flow. The court held that there was sufficient evidence to indicate that the flow of the creek had been materially diminished and that such flow was insufficient to meet plaintiff's needs. The court thus held that plaintiff's riparian right to the flow of the stream had been violated and that he was entitled to damages for such violation. (Snow-Florida)

VILLAGE OF WOODBRIDGE V BOGAN (EMINENT DOMAIN AND LIABILITY FOR DAMAGES DUE TO WATER POLLUTION).
291 NYS 381-382 (App Div 1936).

Descriptors: *New York, *Sewage disposal, *Water pollution, *Damages, Boating, Condemna-

tion, Condemnation value, Outlets, Waste disposal, Sewerage, Land, Land appraisal, Land ownership, Lakes, Ponds, Legal aspects, Judicial decisions, Eminent domain, Compensation, Property values, Discharge (Water).

Plaintiff municipality condemned defendants' lands which bordered a lake for the purpose of constructing a sewage plant. Discharge from the proposed plant was to empty into the lake. Defendants were awarded the value of the land condemned and damages for injury to defendants' bathing and boating business which would result from the sewage discharge. Plaintiff appealed such award. The appellate court affirmed per curiam, holding that the evidence supported the award. Two judges would have affirmed but reduced the amount of the award. (Duss-Florida)

EASTON V STATE (AMOUNT OF COMPENSATION FOR TAKING OF LAND AND POLLUTING A STREAM).

153 Misc 395, 275 NYS 119-121 (1934).

Descriptors: *New York, *Water pollution, *Subsurface waters, *Compensation, Underground streams, Springs, Watercourses (Legal), Channels, Damages, Flow, Water quality, Water sources, Spring waters, Construction, Grading, Legal aspects, Judicial decisions, Land, Condemnation.

Claimants sought an award for land appropriated for railroad grade elimination purposes and for damages alleged to have been caused when such construction resulted in the pollution of a spring located on county property, the waters of which claimants had reserved to themselves in their instrument of conveyance. The Court of Claims found that claimants were entitled only to the value of the land taken. The spring in question was entirely fed by subterranean waters whose sources and channels were unknown. Liability for interference with such waters can only be sustained upon the theory of negligence. There was no proof that defendant had not done its work in a proper manner. Claimants relied solely on the fact that before construction the spring contained pure water and afterwards the water was unfit. The court held that such was insufficient evidence to prove negligence. (Duss-Florida)

SOUTHERN NEW ENGLAND ICE CO V TOWN OF WEST HARTFORD (CITY LIABLE FOR NUISANCE CAUSED BY DUMPING SEWAGE INTO STREAM).
159 A 470-477 (Conn 1932).

Descriptors: *Connecticut, *Municipal wastes, *Lake ice, *Prescriptive rights, Ice, Water pollution, Ponds, Water pollution effects, Water pollution sources, Sewage, Local governments, Sewage bacteria, Waste identification, Streams, Condemnation, Sewers, Sewage disposal, Flow, Riparian rights, Water rights, Legal aspects, Judicial decisions, Remedies, Damages.

Plaintiff ice dealer sued for damages caused when sewage from defendant city's sewers polluted the pond it cut ice from, thereby forcing its disuse for ice making. Defendant contended plaintiff had no legal right to take the ice. The evidence was clear that the ice was satisfactory until defendant's overflow sewer began dumping raw sewage into a stream that flowed into the pond. The Supreme Court of Errors of Connecticut affirmed a verdict for plaintiff, holding that ice had been harvested from the pond for more than 40 years by plaintiff and its predecessors, and thus plaintiff had a prescriptive right to the flowage of the stream and pond. Defendant had a right to construct sewers, but when such sewers constituted a nuisance, defendant was liable for damages occasioned thereby. (Morris-Florida)

RAU V URBAN (LIABILITY FOR PREDECESSOR'S IN TITLE ACTS).
155 A 498-499 (Conn 1931).

Descriptors: *Connecticut, *Watercourses (Legal), *Obstruction to flow, *Diversion, Overflow, Streams, Land tenure, Natural flow, Relative rights, Beds, Natural streams, Channels, Grading, Legal aspects, Judicial decisions, Damages, Impounded waters.

Plaintiff brought suit against defendants to restrain defendants' obstruction of a natural watercourse which resulted in the overflowing of plaintiff's land. Defendants contended that the alleged obstruction was committed by their predecessors in title, and therefore they could not be held liable. From the trial court's judgment for plaintiff, defendant appealed. The Connecticut Supreme Court of Errors affirmed. The finding that defendants and their predecessors obstructed the flow of the watercourse and caused the overflow was supported by the evidence. Defendants could be properly held liable for their predecessor's acts in obstructing the natural flow of water if defendants were given notice of the obstruction and requested to remove it. LEITCH V SANITARY DISTRICT (RIPARIAN RIGHTS AND OBSTRUCTIONS TO NAVIGATION).
386 Ill App 433, 54 NE2d 458-462 (1944).

Descriptors: *Illinois, *Navigable waters, *Riparian rights, *Navigation, Transportation, Damages, Nabigable rivers, Watercourses (Legal), Cities, Bridges, Sewers, Conduits, Administrative agencies, Riparian land, Landfills, Construction, Structures, Solid wastes, Wastes, Legal aspects, Judicial decisions, Rivers.
Identifiers: Obstruction to navigation.

Plaintiff riparian owners sought a mandatory injunction against defendant city and its sanitary district to require removal of obstructions from a watercourse. Plaintiffs alleged that their rights of ingress, egress and navigation to a branch of the Chicago River were destroyed by the filling in of such branch, the construction of a sewer and the construction of a permanent bridge. Defendants put in issue paintiffs' ownership of riparian property, the navigability of the branch and its use for transportation. Defendants also denied filling in the branch and alleged that the bridge had been constructed by the State of Illinois. The trial court ruled for defendants and plaintiffs appealed. The Supreme Court of Illinois affirmed. Plaintiffs failed to prove that either defendant constructed the permanent bridge which was the obstruction which cut off navigation from plaintiffs' property except for those boats able to pass under it. The main obstruction by defendants was the sewer which was well below the surface and allowed ample clearance for boats then using the river. Defendants did run a water main along the bridge, but it did not lower the clearance of such bridge. Requiring defendants to remove these structures would have been of no benefit to plaintiffs, and courts will not require performance of a useless act. (Duss-Florida)
